## Attachment: IR-213

Number	IR-217
Dept.	CNSC
Project effects link	Accidents and Malfunctions
Reference to EIS, appendices, or supporting documentation	Sections 14.6.1 and 14.6.2
Context and Rationale	<p><b>Context:</b> Highway 914 crosses the Wheeler River 10 km southwest of the access road junction. A vehicle accident, including a rollover, collision, or run off road, at or near the bridge could potentially result in a release of uranium concentrate and release of fuels and chemicals into the surface water at this location. Denison believes that a release of uranium concentrate and a release of fuels and chemicals at this location would bound the releases at any other water crossing along the transportation corridor. However, no information on what other water crossings along the transportation corridor exist and how bounding scenarios 1 and 2 would bound the risk of releasing uranium concentrate and fuels and chemicals at other crossings.</p> <p><b>Rationale:</b> The release of uranium concentrate and fuels and chemicals at water crossings would contaminate the water body at the crossings and pose a risk to the environment and public health.</p>
Information Requirement	Please provide information on all water crossings along the transportation corridor and justification why bounding scenarios 1 and 2 would bound the effects of the accidental releases of uranium concentrate and fuels and chemicals at these crossings.

Table to support response in IR table:

Table 3-2 in Appendix A of Appendix 14-A will be updated in the final EIS to include (new) Scenario 2.4 Well Casing Yield and/or Damage:

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
2.4	Scenario 2.4 Well Casing Yield and/or Damage	Co / Op	Loss of lixiviant into the groundwater within freeze wall containment	Occupational health and safety plan Personnel training and orientation Personal protection equipment Spill management and response Secondary containment via freeze wall	2	3	Low	Risk level is low, moderate consequence event (assume localized event to ground where clean up is possible), no further assessment

Notes: "Co" is construction  
"Op" is operations  
"De" is Decommissioning  
"L" is likelihood  
"S" is severity  
"RR" is risk ranking

## Attachment: IR-214

Number	IR-214
Dept.	CNSC
Project effects link	Accidents and Malfunctions
Reference to EIS, appendices, or supporting documentation	Section 14.5.3 Appendix 14-A, section 3.2.3
Context and Rationale	<p><b>Context:</b> Hazard scenarios were identified using a systematic approach that considered the existence of sources of hazards and initiating events for the Project in consideration of Project activities and components. Details for how each of these project components and activities are considered in the initial hazard scenario identification process are provided in the accidents and malfunctions TSD (see Appendix 14-A; Ecometrix 2022).</p> <p>However, in Table 3-1 to Table 3-14 in Appendix A of Appendix 14-A, the following inconsistencies were identified:</p> <ul style="list-style-type: none"> <li>i. consequences for the hazards ID# 1.1, 1.5, 1.7, 14.2 include occupational major injuries; however, the severity (S) is denoted as number 2 that appears to be inconsistent with consequence rating number in Figure 14.5-2</li> <li>ii. Hazard ID# 1.5 has a L=2, but it is described as a highly unlikely event, which is inconsistent with the term in Figure 14.5-2</li> <li>iii. Hazards ID# 3.6 and 3.7 have a L=1, but they are described as low probability event that is inconsistent with the term in Figure 14.5-2</li> <li>iv. Hazards ID# 8.2, 8.3, 9.1, 10.1 to 10.5, 11.1, 11.5 have a L=1, but they are described as unlikely events, which are inconsistent with the term in Figure 14.5-2. Rationale needs to be provided how stockpile erosion is considered to have a L=1</li> <li>v. Hazard ID# 12.1 has a L=2 and S=3, but it's risk ranking is moderate, which is inconsistent with the term in Figure 14.5-2</li> <li>vi. Hazard ID# 13.3 has a L=2. Based on the operation experience in the similar projects in the northern Saskatchewan, ponds lining failure and leakage is a very likely event. Rationale needs to be provided to support L=2 or change the number for L.</li> </ul> <p><b>Rationale:</b> Inconsistent or inaccurate/incorrect information was included in Accidents and Malfunctions assessment.</p>

Information Requirement	Please clarify or correct all inconsistent and/or inaccurate information in Tables 3-1 to 3-14 in Appendix A of Appendix 14-A.
-------------------------	--

Tables to support response to IR-214:

The updated hazard screening tables on the following pages are provided in support of the response to IR-214.

It is noted that the revisions highlighted do not affect the outcome of the screening evaluation and do not necessitate consideration of additional bounding scenarios by way or more detailed analyses.

Site Works - Summary – Nine potential scenarios have been identified. Risks have been characterized as low to moderate as it concerns environmental risks. No scenarios carried forward for quantitative assessment.

Table 3-1: Hazard Identification Evaluation – Site Works

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
1.1	Fall / slip	Co / Op / De	Occupational major injuries	Occupational health and safety plan Personnel training and orientation Personal protection equipment	5	23	ALARP, moderate	Best practice in worker health and safety program resulting in ALARP, no further assessment
1.2	Fall / slip	Co / Op / De	Occupational fatalities	Occupational health and safety plan Personnel training and orientation Personal protection equipment	2	5	ALARP, High	Best practice in worker health and safety program resulting in high but ALARP, no further assessment
1.3	Refuelling accident	Co / Op / De	Hydrocarbon release	Occupational health and safety plan Personnel training and orientation Personal protection equipment Spill management and response Secondary containment	4	2	Low	Overall Risk level is low, <u>low-minor</u> consequence event, no further assessment
1.4	Fuel storage failure	Co / Op / De	Hydrocarbon release	Occupational health and safety plan Personnel training and orientation Personal protection equipment Spill management and response Secondary containment	1	3	Low	Overall Risk level is low, highly unlikely event, no further assessment
1.5	Fuel storage and transfer fire and explosion	Co / Op / De	Occupational major injuries	Occupational health and safety plan Personnel training and orientation Personal protection equipment Fire safety plan and firefighting system	2	23	Low	Overall Risk level is low, <u>highly</u> -unlikely event, no further assessment
1.6	Fuel storage and transfer fire and explosion	Co / Op / De	Occupational fatalities	Occupational health and safety plan Personnel training and orientation Personal protection equipment Fire safety plan and firefighting system	1	5	ALARP, moderate	Best practice in worker health and safety program resulting in ALARP, no further assessment
1.7	Vehicle and construction equipment accident	Co / Op / De	Occupational major injuries	Occupational health and safety plan Personnel training and orientation Preventive and routine maintenance Onsite traffic control (speed limits, signage)	4	2	ALARP, moderate	Best practice in worker health and safety program resulting in ALARP, no further assessment
1.8	Vehicle and construction equipment accident	Co / Op / De	Occupational fatalities	Occupational health and safety plan Personnel training and orientation Preventive and routine maintenance Onsite traffic control	2	5	ALARP, High	Best practice in worker health and safety program resulting in high but ALARP, no further assessment
1.9	Vehicle accident	Co / Op / De	Hazardous materials spill	Occupational health and safety plan Personnel training and orientation Preventive and routine maintenance Onsite traffic control (speed limits, signage) Spill management and response	4	2	Low	Overall Risk level is low, minor consequence <u>events</u> , no further assessment

Access Road / Land Transportation - Summary – Eight potential scenarios have been identified. Risks have been characterized as low to high as it concerns environmental risks. Two scenarios carried forward for quantitative assessment.

Table 3-3: Hazard Identification Evaluation – Access Road / Land Transportation (shaded rows are those recommended for further assessment)

ID#	Accident / Malfunction	Phase	Consequences	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
3.1	Vehicle accident including rollover, collision, run off road	Op	Aquatic release of radioactivity	Occupational health and safety plan Personnel training and orientation Traffic control measures Travel management plan Spill management and emergency response plan	3	5	High	Further Assessment Recommended
3.2	Vehicle accident including rollover, collision, run off road	Co / Op / De	Terrestrial release of radioactivity	Occupational health and safety plan Personnel training and orientation Traffic control measures Travel management plan Spill management and emergency response plan	3	4	ALARP, moderate	Best practice in terrestrial spill containment and cleanup resulting in ALARP, no further assessment
3.3	Vehicle accident including rollover, collision, run off road	Co / Op / De	Aquatic release of fuel, hazardous chemicals and reagents	Occupational health and safety plan Personnel training and orientation Traffic control measures Travel management plan Spill management and emergency response plan	3	5	High	Further Assessment Recommended
3.4	Vehicle accident including rollover, collision, run off road	Co / Op / De	Terrestrial release of fuel, hazardous chemicals and reagents	Occupational health and safety plan Personnel training and orientation Traffic control measures Travel management plan Spill management and emergency response plan	3	4	ALARP, moderate	Best practice in terrestrial spill containment and cleanup resulting in ALARP; Further Assessment Recommended to address interested party concerns (includes consideration of radioactivity)
3.5	Vehicle fire	Co / Op / De	Terrestrial release of hydrocarbons and fuel	Occupational health and safety plan Personnel training and orientation Travel management plan Spill and emergency response plan Spill management and emergency response plan	1	4	ALARP, moderate	Best practice in terrestrial spill containment and cleanup resulting in ALARP, no further assessment
3.6	Vehicle fire	Co / Op / De	Release of radioactivity to air	Occupational health and safety plan Personnel training and orientation Travel management plan Spill and emergency response plan Spill management and emergency response plan	1	4	ALARP, moderate	<u>Overall moderate (ALARP) low-risk, low-probability</u> highly unlikely event. Reversible and transient effect. No further assessment
3.7	Vehicle fire	Co / Op / De	Atmospheric release of particulate and combustion by-products	Occupational health and safety plan Personnel training and orientation Travel management plan Spill management and emergency response plan Fire safety plan and firefighting systems Ambient air monitoring	1	3	Low	<u>Overall low-low risk, highly unlikely-low-probability</u> event. Reversible and transient effect. No further assessment
3.8	Vehicle – Wildlife collision	Co / Op / De	Wildlife fatality	Occupational health and safety plan Personnel training and orientation Traffic control measures Travel management plan	4	2	Low	<u>Overall low risk</u> . Individual (not population) level <u>minor</u> effect, reversible and nonsignificant effect, no further assessment

Notes: "Co" is construction  
"Op" is operations  
"De" is Decommissioning  
"L" is likelihood  
"S" is severity  
"RR" is risk ranking

Airstrip - Summary – Four potential scenarios have been identified. Risks have been characterized as low to moderate as it concerns environmental risks. No scenarios carried forward for quantitative assessment.

Table 3-4: Hazard Identification Evaluation – Airstrip

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
4.1	Fuel storage failure	Co / Op / De	Hydrocarbon release	Occupational health and safety plan Personnel training and orientation Storage inspection, maintenance Secondary containment Spill and emergency response plan	1	3	Low	<del>Overall r</del> Risk level is low, highly unlikely event, no further assessment
4.2	Refuelling accident	Co / Op / De	Hydrocarbon release	Occupational health and safety plan Personnel training and orientation Secondary containment Spill and emergency response plan	4	2	Low	<del>Overall Risk</del> risk level is low, <del>low-minor</del> consequence event, no further assessment
4.3	Plane de-icing chemical release	Co / Op / De	Terrestrial release of reagent; possible aquatic release of reagent	Personnel training Containment Spill and emergency response plan	3	2	Low	<del>Overall r</del> Risk level is low, <del>low-minor</del> consequence event, no further assessment
4.4	<u>Air plane</u> crash	Co / Op / De	Occupational major injuries / fatality Atmospheric release of particulate and combustion by-products Release of hydrocarbons and fuel Damage to mine infrastructure structure	Travel management plan Air traffic control Spill and emergency response plan Fire safety plan and firefighting systems Personnel training	1	5	ALARP, moderate	<del>Low-likelihood</del> Highly unlikely event, best practice in air traffic control resulting in ALARP, no further assessment
4.5	Ground vehicle – <u>air plane</u> collision	Co / Op / De	Occupational major injuries / fatality Atmospheric release of particulate and combustion by-products Release of hydrocarbons and fuel Damage to mine infrastructure structure	Travel management plan Air traffic control Ground traffic control Spill and emergency response plan Fire safety plan and firefighting systems Personnel training	1	5	ALARP, moderate	<del>Low-Highly unlikely</del> likelihood event, best practice in air / ground traffic control resulting in ALARP, no further assessment

Freeze plant - Summary – Five potential scenarios have been identified. Risks have been characterized as low to high as it concerns environmental risks. One scenario is carried forward for quantitative assessment.

Table 3-5: Hazard Identification Evaluation – Freeze plant (shaded rows are those recommended for further assessment)

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
5.1	Ammonia storage and piping failure	Co / Op	Material spill	Occupational health and safety plan Personnel training and orientation Storage inspection, maintenance Secondary containment Spill and emergency response plan	3	2	Low	<del>Overall risk</del> Risk level is low, <del>low-minor</del> consequence event, no further assessment
5.2	Loss of freeze capacity	Op	Loss of freeze wall and secondary underground containment	Freeze wall monitoring Monitoring wells outside of the freeze wall – temp, pressure Back up gensets	1	5	Moderate	Loss of containment of lixiviant outside mining chamber - Further Assessment Recommended. Denison does not believe a leak would occur however public perception of a loss of containment is of high concern and should assessed. In practice, the mechanical failure of refrigeration system can be addressed and mitigated well before the thawing of the freeze wall which would take months.
5.3	Cooling line break	Co / Op	Release of brine below ground and potential for groundwater contamination	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Remote monitoring system Spill and emergency response plan	2	4	ALARP, moderate	<del>Low likelihood</del> Unlikely event, best practice resulting in ALARP, no further assessment
5.4	Cooling line break	Co / Op	Release of brine on surface – potential for ground and groundwater contamination	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Remote monitoring system Pipes in trenches and secondary containment Spill and emergency response plan	2	2	Low	<del>Overall Risk-risk</del> level is low, <del>low-minor</del> consequence event with appropriate response and mitigation, no further assessment
5.5	Pumps failure	Co / Op	Release of brine on surface - potential for surface and groundwater contamination	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Remote monitoring system No open drain from pumphouse Spill and emergency response plan	2	2	Low	<del>Overall Risk-risk</del> level is low, <del>low-minor</del> consequence event with appropriate response and mitigation, no further assessment

Notes: “Co” is construction  
“Op” is operations

Production Plant - Summary – Seven potential scenarios have been identified. Risks have been characterized as low to high as it concerns environmental risks. Two scenarios are carried forward for quantitative assessment.

Table 3-7: Hazard Identification Evaluation – Production Plant (shaded rows are those recommended for further assessment)

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
7.1	Process vessel and piping system failure	Op	Release of sulphuric acid	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Spill and emergency response plan Secondary containment Process sumps Production building is contained	3	2	Low	Overall low Moderate risk, low-minor consequence event, no further assessment
7.2	Process vessel and piping system failure	Op	Release of hydrogen peroxide and potential for fire	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Spill and emergency response plan Secondary containment Process sumps Production building is contained	3	2	Low	Overall low Moderate risk, low-minor consequence event, no further assessment
7.3	Process vessel and piping system failure	Op	Release of magnesium hydroxide	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Spill and emergency response plan Secondary containment Process sumps Production building is contained	3	2	Low	Overall low Moderate risk, low-minor consequence event, no further assessment
7.4	Process vessel and piping system failure, Thickener overflow	Op	Release of aqueous solution	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Spill and emergency response plan Secondary containment Process sumps Production building is contained Detectable signs of exposure e.g., irritation	3	2	Low	Overall low Moderate risk, low-minor consequence event, no further assessment. ALARP
7.5	Process vessel and piping system failure	Op	Release of acidic fume from storage tank	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Availability of respirators Emergency response plan will implement medical response to acute exposure to acidic fumes. Ambient monitoring Building ventilation	3	2	Low	Overall low Moderate risk, low-minor consequence event, no further assessment
7.6	Process vessel and piping system failure	Op	Release of radon from storage tank	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Emergency response plan Ambient monitoring Building ventilation	3	3	Moderate	Overall moderate risk, moderate consequence event - Further Assessment Recommended
7.7	Facility fire / explosion	Op	Release of radioactivity and yellowcake powder to atmosphere	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Fire safety plan and firefighting systems Emergency response plan Ambient air monitoring	2	5	High	Further Assessment Recommended. It is also noted that this scenario could be an outcome of many initiating events – the specific details associated with the event will be determined based on the most current inventory of combustible and flammable materials associated with the production plant when the analysis is completed.
7.8	Process containment and gas cleaning and filtration system failure	Op	Release of yellowcake powder to atmosphere	Inspection, testing, and maintenance program Ambient air monitoring	3	4	ALARP, moderate	The consequence is bounded by scenario 7.7.

EcoMetrix  
Though not captured by the FIRT IR the Likelihood rating of Scenarios 8.1 and 8.2 were inadvertently reversed. That's has been corrected and the revised Likelihood rating for Scenario 8.1 is "highly unlikely", score 1 and the revised Likelihood rating for Scenario 8.2 is "unlikely", score 2.  
With Specific reference FIRT IR 214(IV) it is believed that that the revised scoring "unlikely" better reflects the event likelihood. Stockpile erosion may not be uncommon but stockpile erosion that would lead to an environmental release as envisioned by the scenario in consideration of the design basis is deemed unlikely.

**EcoMetrix**  
Per FIRT IR 214 the likelihood score has been revised from L=2 (unlikely) to L=3 (likely) and therefore overall risk has been updated to ALARP, moderate from Low.  
Based on information received from manufactures and the project team's own experience it is thought the L=3 (≤1 occurrence in 10 years and >1 occurrence in 100 years) may better reflect liner performance, assuming the liner is installed based on appropriate design criteria and used as intended.

## Attachment: IR-217

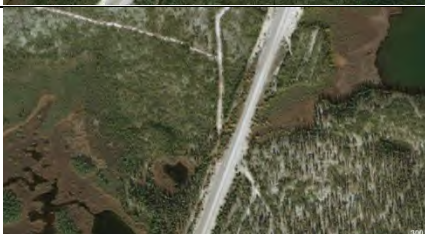

Number	IR-217
Dept.	CNSC
Project effects link	Accidents and Malfunctions
Reference to EIS, appendices, or supporting documentation	Sections 14.6.1 and 14.6.2
Context and Rationale	<p><b>Context:</b> Highway 914 crosses the Wheeler River 10 km southwest of the access road junction. A vehicle accident, including a rollover, collision, or run off road, at or near the bridge could potentially result in a release of uranium concentrate and release of fuels and chemicals into the surface water at this location. Denison believes that a release of uranium concentrate and a release of fuels and chemicals at this location would bound the releases at any other water crossing along the transportation corridor. However, no information on what other water crossings along the transportation corridor exist and how bounding scenarios 1 and 2 would bound the risk of releasing uranium concentrate and fuels and chemicals at other crossings.</p> <p><b>Rationale:</b> The release of uranium concentrate and fuels and chemicals at water crossings would contaminate the water body at the crossings and pose a risk to the environment and public health.</p>
Information Requirement	Please provide information on all water crossings along the transportation corridor and justification why bounding scenarios 1 and 2 would bound the effects of the accidental releases of uranium concentrate and fuels and chemicals at these crossings.

### Response:

As recommended by the reviewer a review of water crossings associated with the transportation route have been identified. For reference, the analysis considers Hwy 914 south from the project site to its junction with Hwy 165. Hwy 165 was further considered east to Hwy 2 and west to Hwy 155. A total of 66 water crossings were identified as shown in Table IR-217-1, below. Coordinates (lat., long.; are provided for each of the crossings along with a basic description of each and a corresponding satellite image. For reference, in the table the designation “Highway 165W” means the location of the crossing is on Hwy 165 west of Hwy 914, beginning at the Hwy 165/155 and travelling east and the designation “Highway 165E” means the crossing is east of Hwy 914, travelling east toward Hwy 2. It is noted that most crossings are not identifiable by a specific name and are thus identified as “Unnamed creek”.

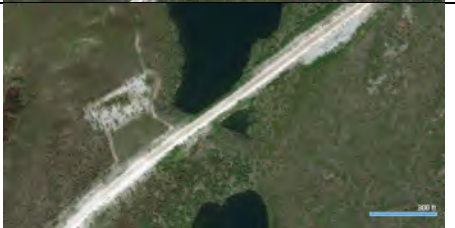

As noted by the reviewer, the potential aquatic environment release scenarios focused on the Wheeler River crossing location. This location was chosen as it represents an important location to resource users in the study area. The scenarios provide examples of the consequences of such releases to local receptors. That is, the results of the assessment of the releases at this location would be expected to be representative of crossings along the transport route since the key endpoint in the assessment is overall risk, as defined for the assessment process as probability multiplied by consequence. For reference, the crossing analysis reference above and presented in the technical memorandum has identified in excess of 100 water crossings along the transportation route as described. It is not practical to assess each of these crossings. While the specific conditions at these crossings may differ in size or nature, the results of the analysis presented can generally be applied more broadly as indicated above. The approach used is consistent with past practice for comparable assessments for uranium projects in the province.

## Attachment: IR-218

Number	IR-218
Dept.	CNSC
Project effects link	Accidents and Malfunctions
Reference to EIS, appendices, or supporting documentation	Sections 14.6.1.1 and 14.6.1.4
Context and Rationale	<p><b>Context:</b> Table 14.6-1 indicates that the average flow of Wheeler River south of Russel Lake is 17,340 L/s or 17.34 m<sup>3</sup>/s. This rate is used for uranium dissolution rate calculation. However, in section 14.6.1.4, it states that the average annual flow is 24.3 m<sup>3</sup>/s. In Table 14.6-3, the last two rows appear to be added wrongly.</p> <p>It also states that sediment quality results are shown in Table 14.6-5 for post-remediation conditions. During minimum flow conditions, the affected volume is expected to be smaller, resulting in a higher sediment concentration. In comparison, higher flow conditions are expected to result in a greater footprint and lower concentrations. However, in Table 14.6-5, the average sediments concentration and porewater concentration appear to be incorrect and switched between average flow and maximum flow.</p> <p><b>Rationale:</b> Inconsistent/inaccurate information provided in the EIS.</p>
Information Requirement	Please clarify and correct the inconsistent information on average flow rate of Wheeler River at the crossing and incorrect information in Table 14.6-3, and average sediment concentration and porewater concentration under average and maximum flow conditions in Table 14.6-5.

Updated EIS tables to support response:

Table 14.6-5 to be revised as shown below:

Flow	Affected Distance (m)	Average Sediment Concentration (µg/g)	Porewater Concentration (µg/L)
Minimum	21	3,461	12
Average	33	3,309 <del>2,535</del>	129
Maximum	47	2,535 <del>3,309</del>	912

Table 8-5 to be revised as shown below:

Flow	Affected Distance (m)	Average Sediment Concentration (µg/g)	Porewater Concentration (µg/L)
Minimum	21	3,461	12
Average	33	<u>3,309</u> <del>2,535</del>	<u>129</u>
Maximum	47	<u>2,535</u> <del>3,309</del>	<u>912</u>

## Attachment: IR-236

Number	IR-236
Dept.	ECCC
Project effects link	Fish and fish habitat
Reference to EIS, appendices, or supporting documentation	Section 15.5.2, Expected Environmental Conditions
Context and Rationale	<p>Context: It is stated that, “Table 15.5-1 and Table 15.5-2 summarize the predicted mean values of the climate variables for the Tomblin Lake regional grid unit...”</p> <p>As per the Proponent’s description, Tomblin Lake was chosen as representative location for Wheeler when Climate Atlas was used as data source.</p> <p>Rationale: In those two tables, for the “Max 1-Day Precipitation (mm)” the historical average is given as 24.1mm. Local time series analysis for the climatic region in which Wheeler Project is located provide averages (for 1-day max precipitation) of approximately 30+ mm.</p> <p>It is the Proponent’s responsibility to keep the required database current and up to date, because the length of the time series influences all derived statistics.</p> <p>Statistical analysis of extreme events is highly dependent of the mean with extreme values reaching values 3 to 4 times higher than the mean.</p>
Information Requirement	<p>1. Provide a clear explanation on how the historical mean for 1-Day Max Precipitation was calculated.</p> <p>2. Compare the values obtained via various means (ex: copied from the internet, modeled via some online algorithm, derived from specialty literature), against time series analysis based on observations.</p> <p>Technical Discussion Required: Yes</p>

### Response:

During the EIS review by the FIRT, there were information requirements (IRs; mainly IR-235 and IR-236, and to a lesser extent IR-103 and IR-104) related to current and future climate precipitation, as well as the probable maximum precipitation. The information in Attachment IR-236 will be added as *Appendix D Summary of Precipitation Values Presented in the EIS* to Appendix 6-C in the final EIS. The Project design and site drainage plan are more closely linked to detailed design to support the licensing process and the precipitation information provided in the draft EIS to support an EA decision is adequate. This new appendix to Appendix 6-C serves to provide clarifications only.

The probable maximum precipitation (PMP) event used for feasibility engineering designs is 493 mm. The PMP value has been extrapolated from Key Lake data presented in the Canadian Climate Program

(1994). Denison reviewed the update to the Canadian Climate Program (1994) report provided in Atmospheric Environment Branch (1999) which shows PMP at the approximate Wheeler River Project location at 489.3 mm. Denison retained the higher of the two PMP values, i.e., 493 mm, for design purposes. As an example, during a PMP, water requiring management will report to the wellfield runoff pond which will be sized to accommodate a PMP event at the site. This pond has been sized to 38,200 m<sup>3</sup> (*excluding a freeboard of 1 meter*). From the wellfield runoff pond, water will then be sent to the process water pond for treatment if required. In EIS Section 2.8 Project Design Features, Denison notes that “Ponds will be designed to maintain a minimum freeboard of at least 1.0 m to allow for continued functioning during a probable maximum precipitation (PMP) event.”

Tables 1 to 4 below provide a summary of precipitation information for both current / existing climate and future climate under different emissions scenarios, in order to 1) summarize precipitation data from various sections of the EIS (Section 6 including Appendix 6-C, Section 8, and Section 15) and 2) provide context on the PMP of 493 mm in comparison to precipitation values (annual precipitation, maximum 1-day precipitation, and 1:100 year, 24 hour return).

Table 1: Precipitation - Existing Climate – Comparisons of Observed Annual Average Precipitation and Maximum 24-hour Precipitation to PMP

Precipitation-related metric	Value	Notes on Source of Data	Location in EIS and comment on how this information was used in the EIS	Commentary on metric compared to PMP (493 mm)
Annual average precipitation	456 mm	Recorded from Key Lake in the period from 2011-2020, ECCC station 4063753 Available at: <a href="http://climate.weather.gc.ca">climate.weather.gc.ca</a>	Presented in 6.1.3.1.2 Precipitation and Appendix 6-C. Provides point of comparison for selected Project PMP.	<b><i>PMP is similar to annual precipitation</i></b>
Annual average precipitation	483 mm	Canadian Climate Normals 1981-2010 Station Data, Key Lake, Saskatchewan. Available at: <a href="http://climate.weather.gc.ca">climate.weather.gc.ca</a>	Presented in 6.1.3.1.2 Precipitation and Appendix 6-C. Provides point of comparison for selected Project PMP.	<b><i>PMP is similar to annual precipitation</i></b>
Maximum 24-hour precipitation	45.9 mm	Occurred on August 8, 2020.  Recorded from Key Lake in the period from 2011-2020, ECCC station 4063753 Available at: <a href="http://climate.weather.gc.ca">climate.weather.gc.ca</a>	Presented in 6.1.3.1.2 Precipitation and Appendix 6-C. Provides point of comparison for selected Project PMP.	<b><i>24-hr event is 10.7 x lower than PMP</i></b>
Maximum 24-hour precipitation	72 mm	Occurred July 12, 1998. Canadian Climate Normals 1981-2010 Station Data, Key Lake, Saskatchewan. Available at: <a href="http://climate.weather.gc.ca">climate.weather.gc.ca</a>	Presented in 6.1.3.1.2 Precipitation and Appendix 6-C. Provides point of comparison for selected Project PMP.	<b><i>24-hr event is 6.8 x lower than PMP</i></b>

Precipitation-related metric	Value	Notes on Source of Data	Location in EIS and comment on how this information was used in the EIS	Commentary on metric compared to PMP (493 mm)
1 in 100 year, 24 hour return	79.9 mm	Calculated using IDF_CC Tool for the Wheeler River Project. Available at: <a href="http://www.idf-cc-uwo.ca">www.idf-cc-uwo.ca</a>	8.1.3.4 Climate Change Influenced Extreme Events and Appendix 8-B. Provides point of comparison for water management design and understanding rainfall associated with 1:100-year storms.	<b>1:100 is 6.2 x lower than PMP</b>
1 in 100 year, 24 hour return	56.4 mm	Return Period Estimate based on data from the Key Lake Mine using the IDF_CC Tool (~32 km away from Wheeler River Project). Available at: <a href="http://www.idf-cc-uwo.ca">www.idf-cc-uwo.ca</a>	8.1.3.4 Climate Change Influenced Extreme Events and Appendix 8-B. Provides point of comparison for water management design and understanding rainfall associated with 1:100-year storms.	<b>1:100 is 8.7 x lower than PMP</b>

Table 2: Precipitation – Future Climate - Existing and Predicted Precipitation Data for Key Lake (provided in EIS, Appendix 6-C, Table 10)

Year	Total Annual (mm)				Maximum 1-day (mm)			
	Measured	RCP 2.6	RCP 4.5	RCP 8.5	Measured	RCP 2.6	RCP 4.5	RCP 8.5

## Attachment: IR-237

Number	IR-237
Dept.	CNSC
Project effects link	EA follow-up and monitoring program
Reference to EIS, appendices, or supporting documentation	Appendix 16-C throughout, including Table 1.5-1: Wheeler River Monitoring and Follow-up Program Summary (p. 8-15)
Context and Rationale	<p><b>Context:</b> CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> state: “The EIS should provide discussion on the follow-up program’s requirements, and include:</p> <ul style="list-style-type: none"> <li>objectives and structure of the follow-up program and the VCs targeted by the program</li> <li>tabular summary and explanatory text of the main components of the program including: <ul style="list-style-type: none"> <li>a description of each monitoring activity under that component</li> <li><u>which of the two generic program objectives the activity is relevant to (e.g., verify EA predictions, determine effectiveness of mitigation measures)</u></li> <li>the specific statement from the EA that goes along with that generic objective and will be the focus for that activity (e.g., program objective: verify predicted effects; environmental assessment effect: no potential adverse effects)</li> <li>the specific monitoring objective for that activity</li> <li>planned schedule</li> </ul> </li> <li><u>roles and responsibilities to be played by the proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the program results</u></li> <li><u>possible involvement of independent researchers</u></li> <li><u>program funding sources</u></li> <li>information management and reporting (reporting frequency, methods and format)</li> <li><u>possible opportunities for the proponent to include the participation of the public and Indigenous groups, during the development and implementation of the program</u></li> </ul> <p><u>The follow-up program plan should be sufficiently described in the EIS to allow independent judgment as to the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures.”</u> (Section 11)</p> <p><b>Rationale:</b> The Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information, and while some of the aspects detailed in the Generic EIS Guidelines are included, the aspects underlined are missing or appear incomplete.</p> <p>Further, all information from throughout the EIS should be incorporated into this Summary. For example, the EIS notes that: “Groundwater samples will be collected at least monthly and semi-annually in the wells within the freeze wall and on the freeze wall perimeter, respectively” (p. 7-109) and that “At least five to seven multi-well clusters are proposed across the mined area (Figure 7.8-2). Sampling will include KI parameters or the full suite of COPC at different times in the remediation process” (p. 7-111).</p> <p>These details (only examples) are not included in Appendix 16-C.</p>

Information Requirement	<p>It is recognized that this document will evolve over the planning process and be finalized prior to the EA Decision; however, as plans are developed and revised, CNSC staff expect that updates will be made to this document and provided with any future versions of the EIS.</p> <p>Appendix 16-C Summary of Monitoring and Follow-up Programs must include sufficient details to allow CNSC staff to determine the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures. This includes concrete monitoring plans (sampling locations, frequency, etc.).</p> <p>Additionally, please incorporate any relevant information included in the EIS into this Summary.</p>
-------------------------	--

Response:

Denison concurs that follow-up program documentation will evolve over the planning process and is committed to providing complete and up to date documentation as the EIS is finalized and prior to the EA Decision. Per the March 20, 2023 letter from the CNSC to Denison (Subject: Results of the Federal-Indigenous Review Team technical review of the October 21st, 2022 Draft Environmental Impact Statement Submission for the proposed Wheeler River Project), the company will be providing, as part of the final EIS documentation, a Commitments Report in order to capture all the mitigation measures, follow-up program measures and commitments that have been referenced in the EA documentation in a single location for completeness and traceability. The Commitments Report will be scoped so that it also fulfils the obligations of the commitments registry required by the Saskatchewan Ministry of Environment.

Notwithstanding the above, Denison believes that section 16-C, Summary of Monitoring and Follow-up Programs, in the draft EIS generally meets the requirements outlined in the EIS guidelines but agrees that some additional information can be provided to clarify select aspects. Specific notes per the EIS Guidelines are provided below to provide context the remainder of the response. For reference text in *italics* is taken from the EIS Guidelines; whereas text in **bold** is commentary provide by Denison. Additionally, bold text that is underlined indicates where Denison commits to revising or adding information into the EIS.

*The EIS shall include a framework or preliminary program upon which EA follow-up actions will be managed throughout the life of the project.* **Note from Denison – Table 1-5.1 in Appendix 16-C identifies a framework or preliminary program upon which EA follow-up actions will be managed, as well as all phases of the Project in which the proposed individual follow up programs will be executed.**

*The EIS should provide discussion on the follow-up program's requirements, and include:*

- *objectives and structure of the follow-up program and the VCs targeted by the program* - **Note from Denison - Table 1-5.1 in Appendix 16-C identifies the objectives of the proposed individual follow up programs, provides an overall program structure and identifies the VCs targeted by the program.**
- *tabular summary and explanatory text of the main components of the program including:*
  - o *a description of each monitoring activity under that component* - **Note from Denison - Table 1-5.1 in Appendix 16-C identifies each proposed monitoring activity for the various technical disciplines within which the environment assessment has been organized.**
  - o *which of the two generic program objectives the activity is relevant to (e.g., verify EA predictions, determine effectiveness of mitigation measures)* - **Note from**

**Denison - Table 1-5.1 in Appendix 16-C generally identifies whether the proposed follow up activities are related to verifying EA predictions and/or determine effectiveness of mitigation measures (see column “Monitoring Program Objective(s)”); however, it is agreed that further clarity can be provided in this regard. In the updated version of Table 1-5.1 a further column will be added to indicate specifically whether the proposed follow up activities are related to verifying EA predictions and/or determine effectiveness of mitigation measures with rational.**

- o *the specific statement from the EA that goes along with that generic objective and will be the focus for that activity (e.g., program objective: verify predicted effects; environmental assessment effect: no potential adverse effects) – Note from Denison - Table 1-5.1 in Appendix 16-C identifies the relevant section of the EIS to which each proposed follow up activity refers. however, it is agreed that further clarity can be provided in this regard. In the updated version of Table 1-5.1 a further, more specific reference to the section / subsection / statement (as appropriate) will be added to the “EIS Reference” column for greater traceability between the assessment section of the EIS for each of the technical disciplines and the proposed follow activities.*
- o *the specific monitoring objective for that activity- Note from Denison - Table 1-5.1 in Appendix 16-C identifies the objectives of the proposed individual follow up programs.*
- o *planned schedule - Note from Denison -Table 1-5.1 in Appendix 16-C identifies the phases of the Project in which the proposed individual follow up programs will be executed. It is premature in Denison’s view to develop specific “schedule” associated with all follow-up activities that are proposed. As noted in draft EIS Section 1.7.5, Licensing and Permitting, as well as in other responses to FIRT IRs, the Project is proceeding through sequential EA and licensing process. Given the sequential process to which Denison has committed it is planned that further detail will be developed to align with detailed engineering design through licensing and permitting and that this information will be available for review at that time. Denison understands that the Project cannot move forward until the appropriate Program / Plan / Procedure documentation is in place and has received approval through the regulatory process.*

*roles and responsibilities to be played by the proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the program results - Note from Denison – At this time and commensurate with the level of detail (i.e. concept) at which the follow up activities have been defined the proponent assumes responsibility for execution of all proposed activities. This may change as the program details are developed, and Denison presumes this is likely as it continues to work with the key Indigenous groups. It is noted however that provisions for follow up activities and monitoring are expected to be included in agreements developed between Denison and its key Indigenous partners and therefore it is inappropriate (and may remain so) that specific details regarding follow up activities be shared without the expressed consent of the agreement signatories. Regulatory agencies at the provincial and federal levels are expected to largely play a review/approval role consistent with their responsibilities under various laws/acts/licenses/permits under which the Project, and follow up activities, will be executed. At this time there are no specific plans with local and regional organizations as it pertains to the design, implementation and evaluation of the program results; but this may change in the future. Per the above, Denison will add additional detail into Table 1-5.1 in Appendix 16-C with respect to roles and responsibilities consistent with the information provided in this IR response. As noted full disclosure of such information may not be possible as it would be*

**subject to non-disclosure covenants between Denison and its key Indigenous partners; nevertheless more specific information will be provided as is available.**

- *possible involvement of independent researchers* – **Note from Denison** – Involvement of independent researchers in follow up activities has not been identified at this time, nor has need for such been specifically flagged. This does not preclude possible involvement of independent researchers in the future; however, need for such has not been specifically flagged. As noted above, provisions for follow up activities and monitoring are expected to be included in agreements developed between Denison and its key Indigenous partners, and such follow up activities and monitoring could include independent research. The sharing of information related to this type of independent research can and would only be shared with the expressed consent of the agreement signatories. **Per the above, Denison will add narrative to the text of Appendix 16-C clarifying the role of independent research that is consistent with the understanding of such at the time the final EIS is published.**
- *program funding sources* – **Note from Denison** – As noted above, the proponent assumes responsibility for execution of all proposed follow up activities that have been identified and therefore the funding of such. Also as noted above, provisions for follow up activities and monitoring that may be included in agreements developed between Denison and its key Indigenous partners will be subject to non-disclosure covenants in those agreements. This would include information concerning any funding that may be associated with these programs. It would be inappropriate (and may remain so) that specific details regarding any funding that may be provided for follow up activities be shared without the expressed consent of the agreement signatories.
- *information management and reporting (reporting frequency, methods and format)* – **Note from Denison** – A framework for information management and reporting is provided in Section 1.2 of Appendix 16-C. As described in Section 1.2 of Appendix 16-C specific information management and reporting structures associated with follow up activities are proposed to be developed as part of the development of the Project Environmental Management System (EMS). The Project EMS will be developed during licensing and permitting and that this information, including more detailed information regarding information management and reporting (e.g., reporting frequency, methods and format) will be available for review at that time. Denison understands that the Project cannot move forward until the appropriate Program / Plan / Procedure documentation is in place and has received approval through the regulatory process.
- *possible opportunities for the proponent to include the participation of the public and Indigenous groups, during the development and implementation of the program* – **Note from Denison** – As noted above, Denison is committed to continuing the ongoing process of identifying opportunities the participation of the public and Indigenous groups as follow up activity programs evolve. There is nothing specific to share at this time but it is expected that further clarity in this respect will be provided in the near to medium terms. It is also understood that any information that can be shared only represents a snapshot in time. Since follow up activities will span the full lifecycle of the Project identification of potential opportunities for involvement is an ongoing process that will also span the full lifecycle of the Project.

Denison anticipates that the lengthy and evolving EIS review process, and consideration of the public comments received by Denison on June 27<sup>th</sup>, 2023, will bring forward additional mitigation and follow up activities. Denison will update Section 16-C, Summary of Monitoring and Follow-up Programs, per the commentary provided in response to IR-237 and will also include changes resulting from the FIRT review process and the Saskatchewan Ministry of Environment review process. This section will align with the Project's Commitment Report which will be provided as part of the final EIS documentation.

Responses to Advice to Proponent

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-01	Canadian Nuclear Safety Commission (CNSC)	Glossary sections	<p>There are terms used throughout the EIS that may either need defining, or inclusion in the glossary.</p> <ul style="list-style-type: none"><li>· “Bounding”, “bounding case” and “bound” are used frequently throughout the EIS to describe the scope of the assessment. For example, p. 2-6 the EIS States: “Denison has bound the environmental assessment above the deposit...”</li><li>· “Laydown”. P. 2-54 states: “During Construction, Denison plans to create a laydown area next to the future domestic landfill to temporarily store construction waste. Examples of materials include clean wood, plastics, metal, and concrete. The construction laydown area will not be lined, but it will have a berm surrounding the area to minimize run-on and runoff.”</li><li>· “Deflagration” (p. 2-22)</li><li>· “Speed of sound” The EIS states: “Deflagration means the material burns slower than the speed of sound, thus no shock waves are generated. Propellant permeability enhancement methods reach injection pressures of up to 8,000 psi and are near instantaneous over periods of milli seconds...” (p. 2-22) - Explain briefly what is meant by “speed of sound”</li><li>· “Dries” (p. 2-65): “the main dries will be located in the processing plant”</li><li>· “Scarified” 2-84 Laydown areas will be scarified, covered with 0.5 to 1.0 m of stockpiled overburden, and vegetated with native, self-sustaining species.</li><li>· “Furblock” (p. 4-29)</li><li>· “Cutlines” (p. 4-101)</li></ul>	<p>Add this terminology to either one of the early glossaries, or when describing the methodology, in order to help readers understand these terms (particularly non-technical readers, such as Indigenous peoples and members of the public).</p>	<p>Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.</p>
AD-02	CNSC	General	<p>Mining solution and lixiviant are used interchangeably throughout the EIS. When both are used periodically, may be difficult for a member of the public to recognize that these are one in the same (mining fluid seems more often used).</p>	<p>Be consistent in how this is referred to, in order to ensure it’s clear to readers that these are one and the same.</p>	<p>Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.</p>
AD-03	CNSC	Throughout the Executive Summary (ES) and draft EIS	<p>Errors in formatting and grammar were identified throughout ES and EIS. Some examples are underlined below:</p>	<p>Please correct these and any other formatting, spelling or grammatical errors.</p>	<p>Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.</p>
AD-04	CNSC	Section 2.2.1 Mining (p. 2-4 to 2-5)	<p>An arial view could be useful to help a reader understand the proposed freeze wall earlier in section 2 (e.g., The shape, whether it surrounds the deposit). This is unclear but there are good images further down in the EIS (i.e., Figure 2.3-1 on p. 2-78).</p>	<p>Consider adding image to Section 2.2.1, similar to or containing aspects of Figure 2.3-1.</p>	<p>Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-05	Transport Canada (TC)	Sections 2.2.3.2, 2.2.3.10, 2.2.5.1, 2.3.1.6, 8.3.4.2.2, 11.1.4.4.2,	The two water crossings over Kratchkowsky Creek and Hart Creek and the water intake and effluent discharge/intake pipeline and diffuser at Whitefish Lake may be subject to the <i>Canadian Navigable Waters Act</i> (CNWA). However, these works may be exempt from the CNWA, if they meet the requirements of the Minor Works Order.	<p>*This advice pertains to the regulatory phase.*</p> <p>It is recommended that the Proponent self-assess each work using TC’s Project Review Tool as follows: <a href="https://npp-submissions-demandes-ppn.tc.canada.ca/projectreview-outildexamenduprojet">https://npp-submissions-demandes-ppn.tc.canada.ca/projectreview-outildexamenduprojet</a></p> <p>If the works do not fit the Minor Works Order, the Proponent has the option to either submit an application for approval to the NPP, or use the public resolution process, as these are all unscheduled waterways. The full text of the Minor Works Order is available here: <a href="https://laws-lois.justice.gc.ca/eng/regulations/SOR-2021-170/page-1.html">https://laws-lois.justice.gc.ca/eng/regulations/SOR-2021-170/page-1.html</a>.</p> <p>Background information on the NPP, the Minor Works Order, the application for approval process and the public resolution process are available here: <a href="https://tc.canada.ca/en/programs/navigation-protection-program/apply-npp">https://tc.canada.ca/en/programs/navigation-protection-program/apply-npp</a></p>	Acknowledged and Denison will address this in the regulatory phase as highlighted.
AD-06	Environment and Climate Change Canada (ECCC)	Section 2.2.3.8, Project Description	<p>In this section it is stated that: “The third step of the Industrial Wastewater Treatment Plant (IWWTP) is anticipated to further neutralize and improve the remaining water quality proposed to be achieved with further pH adjustments through agitated tanks and a clarifier with negligible solids generation expected at this stage. Several additional technologies including ion exchange are being evaluated as part of an ongoing Best Available Technology Study to be complete as part of future permitting.” ECCC would be interested in reviewing this study when it becomes available.</p> <p>Considering that the third step of the effluent treatment process in the IWWTP is still undergoing development, ECCC cannot make final conclusions regarding the efficacy of the treatment process. When final treatment technologies have been evaluated and selected, ECCC would like to review this information to allow for release to the environment.</p>	ECCC requests the opportunity to review the Best Available Technology Study and selected treatment technologies for the IWWTP when the report becomes available.	The BATEA information for the IWWTP will be included in Denison’s application to the CNSC for a license to operate. As such, ECCC can direct their review request for review to the CNSC.
AD-07	TC	Section 2.2.5.3	With respect to the proposed airstrip, under the <i>Aeronautics Act</i> , the proposed airstrip would be considered an “aerodrome”, which is defined as: “aerodrome means any area of land, water (including the frozen surface thereof) or other supporting surface used, designed, prepared, equipped or set apart for use either in whole or in part for the arrival, departure, movement or servicing of aircraft and includes any buildings, installations and equipment situated thereon or associated therewith.” Aerodromes, including the one proposed by Denison, are subject to the <i>Aeronautics Act</i> and the Canadian Aviation Regulations (CARs).	<p>*This advice pertains to the regulatory phase.*</p> <p>The proponent must notify the Minister of Transport of the proposed airstrip (aerodrome). This notification, being a summary report to the Minister of Transport, is required by section 307 of the CARs (CARs 307). CARs 307 also requires Denison to undertake consultation in the prescribed manner before it constructs the proposed aerodrome at the mine site. Details of the consultation are to be included in the above-mentioned summary report to the Minister of Transport.</p> <p>CARs 307 identifies the requirement to consult to include anyone seeking to undertake a prescribed aerodrome work at a certified or non-certified aerodrome, whether it is the creation of a new aerodrome or, at an existing aerodrome, lengthening an existing runway or making a</p>	Acknowledged and Denison will address this in the regulatory phase as highlighted.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
				<p>new one. The Regulation also provides minimum expectations for how the consultation should be conducted, including timelines, who to notify and under what circumstances. The intent of the Regulation is to compel consultation in advance of an aerodrome work that will result in sustained and regular impact on interested parties as identified in the Regulation. As the proposed aerodrome will not be within 4 kilometres of a city or built-up area, under CARs 307, the proponent is required to consult the following interested parties:</p> <ul style="list-style-type: none"><li>(i) the Minister of Transport,</li><li>(ii) the providers of air navigation services,</li><li>(iii) the operator of a certified or registered aerodrome located within a radius of 30 nautical miles from the location of the proposed aerodrome work,</li><li>(iv) the authority responsible for a protected area located within a radius of 4 000 m from the location of the proposed aerodrome work,</li><li>(v) any local land use authority where the proposed aerodrome work is to be carried out, and</li><li>(vi) the owner of any land bordering the land on which the proposed aerodrome work is to be carried out.</li></ul> <p>Proponents are encouraged to share their plans with the local land use authority before the consultation period. The local land use authority may have information about other nearby projects or developments that could impact on the proponent's plans.</p> <p>In summary, regarding the airstrip (aerodrome), the proponent must complete the consultation and file the summary report with the Minister of Transport, prior to commencing construction of the aerodrome.</p> <p>Further details can be found at: <a href="https://laws-lois.justice.gc.ca/eng/regulations/SOR-96-433/FullText.html#s-307.01">https://laws-lois.justice.gc.ca/eng/regulations/SOR-96-433/FullText.html#s-307.01</a>.</p> <p>TC recommends that the proponent contact TC's Aerodromes Group at CASPNR- SACRPN@tc.gc.ca before starting the consultation, to ensure it is completed in accordance with CARs 307.</p>	
AD-08	CNSC	Figs. 3.4-1, 4.3. 1, and where applicable throughout the EIS	Some maps in the EIS do not contain highway numbers.	Please consider including the highway numbers on the maps early in the Draft EIS when laying out the project location so the reader can become familiar with road network within northern Saskatchewan when discussions take place.	Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-09	CNSC	Section 4, including Figures 4.3.1 and/or 4.3.2 and where applicable throughout the EIS.	The maps included in the EIS in sections do not have any Treaty boundaries. First Nation Treaties should be included on the map. Not all First Nations reserves, and boundaries are included on the map such as Cree Lake and Slush Lake, please include on map and consider adding others from the NAD.	It is recommended that Denison update the maps in these sections to include Treaty Boundaries and community locations are included on the Project location map in Figure 4.3.2 and other maps throughout the entire EIS where applicable.	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.
AD-10	CNSC	Section 4	Overall, CNSC believes that Denison is abiding by the communications strategies and products identified in their PIDP, but would be interested in additional information that is available.	While CNSC staff are satisfied that the proponent meets the requirements with this EIS, further clarity and detail on the strategic planning behind these communications activities would be beneficial and would further support the overall goals of the Project’s engagement activities.	Acknowledged. Further details on the Public Information Program and Public Disclosure will form part of the documentation submitted in support of the CNSC licensing for the Project.
AD-11	CNSC	Section 4 Indigenous Engagement Report (IER)	There is a summary of what engagement activities will occur moving forward. However, it is not clear which engagement activities/meetings will occur during the different stages of the EA/ project life cycle. Please provide additional details upon submission of the Final EIS.	Denison should consider clarifying in the updated IER which engagement activities will occur during each stage of the project moving forward as per Reg Doc 3.2.2 before submitting the Final EIS.	<p>The engagement activities as outlined in the draft EIS are reflective of the iterative nature of engagement with respect to the Project.</p> <p>At the time of the filing of the final EIS, Denison will describe the status of engagement and future expected engagement activities to occur, which will continue to be aligned with the requirements of Reg Doc 3.2.2.</p>
AD-12	CNSC	Section 4 IER	Information included in the EIS Section 4 and IER regarding engagement activities, communication and issues and concerns raised will need to be updated when the next version of the EIS is submitted. The EIS and IER will need to be updated to include information from Fall of 2022 until approximately two months prior to the submission date of the next EIS.	When re-submitting the EIS, ensure that the engagement log, issues and concerns tables and information about engagement activities done to date have been updated. No action needed only advice to update this section before submission with most up to date engagement activities including any that take place with other Indigenous Nations and communities not included in the Draft EIS.	Acknowledged.
AD-13	CNSC	Section 4 IER	Denison states that validation of VC selection was completed with ERFN, the Northern Village of Beauval, the Northern Village of Pinehouse Lake, and the Northern Hamlet of Patuanak (hereafter Beauval, Pinehouse, and Hamlet of Patuanak, respectively). The EIS states that this was completed through a shared online survey. The EIS also indicates that YNLR was also included in this process.	How has Denison validated VC selection with the other Indigenous Nations and communities that have showed interest and if so, by what methods (survey’s, engagement, meetings, review of Draft sections etc.?) Did Indigenous Nations and communities select any VC’s that were not included in the EIS and if so why not? Please elaborate and provide more details in the EIS on any other methods used including engagement sessions that were completed with Indigenous Nations and communities, through in-person community workshops, VC selection approval through early review of Draft EIS sections.	<p>Section 4 of the draft EIS describes the approach taken related to the Indigenous and non-Indigenous Communities of Interest in relation to the Wheeler River Project. Denison has engaged with these entities regarding the validation of the VC selection.</p> <p>Denison has not undertaken VC validation activities with other Indigenous Nations or communities that have shown interest in the Project, owing to the systematic approach to engagement Denison has been following. This approach is consistent with the methodology presented to the CNSC by Denison in early 2020, for which confirmation was received in mid-2020 and reflected in the draft EIS.</p> <p>All activities undertaken in relation to engagement on VCs are currently described in the EIS; there are no additional details to add.</p> <p>Denison can confirm that it is unaware of additional or new VCs brought forward by other Indigenous Nations or communities that are not suitably captured within the current draft EA approach.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-14	CNSC	Section 4.3.1, Pg 246	On this page, Denison states that MN-S is “currently structured with a President, an Executive, a Provincial Metis Council, Regional Presidents, and Local Presidents. The wording of ‘Regional President’ is incorrect and should be changed to say, ‘Regional Director’.	Please update all wording of “Regional President” to “Regional Director” when referring to MN-S.	Thank you for the advice comment. This will be corrected in the final EIS.
AD-15	ECCC	Sections 5.3.4 (Table 5.3-3); 8.1.3.3 Climate Change; 8.1.3.4 Climate Change Influenced Extreme Events; Table 15.4-1: Summary of Potential Effects of Short-term Extreme Weather  Events on the Project and Associated Mitigation; Section 15.5 Climate Change.	<p>The Proponent indicates that the Project’s full lifetime is roughly 40 years (including the post- decommissioning phase) and that climate conditions are important design considerations for a number of sensitive aspects of the Project. Potential future climate changes and their potential effects on the Project and Valued Components (VCs) are described in various sections of the draft EIS. Notably, in Section 15.5.2, ensemble mean projections are provided for several climate variables for two future time periods and emissions scenarios (RCP 4.5 and 8.5). In Section 8.1.3.4, the Proponent describes possible future changes in short-duration precipitation extremes (based on Intensity Duration Frequency or IDF curves from the IDF_CC tool) and indicates that an increase in their frequency and magnitude may occur over the Project lifetime “... and may require consideration for greater storage and conveyance capacity for Project water management infrastructure” (p.8-41).</p> <p>The Proponent indicates that aspects of the Project are being designed to meet standards based on design values that appear to be derived from observed (i.e. historical) climate conditions (e.g. water management infrastructure; see Table 15.4-1). In Section 15.5.3, they indicate that an adaptive management approach will be used to address some aspects of future climate change as necessary. For example, page 15-19 of the draft EIS states that: “Denison will develop an Emergency Preparedness and Response Program for the Project to address forest fires and extreme weather that may occur. If unforeseen effects on the Project occur from longer and more severe forest fire seasons associated with climate change, or increased frequency or severity of extreme weather (e.g., ice storms, snowstorms, flooding), Denison will apply adaptive management that includes monitoring climate factors so that they can proactively mitigate or prevent adverse climate effects on the Project.” (Emphasis added).</p>	<p>ECCC recommends that when considering potential future climate change and relevant effects on the Project, the Proponent consider the range of variability from the ensemble of models (not just the ensemble mean). ECCC also recommends that the Proponent consult the 2019 Canadian Standards Association Guidance on Intensity Duration Frequency for Canadian Water Resources practitioners , which provides examples of alternative methodologies to estimate future return values for design as needed.</p> <p>In terms of adaptive management, ECCC recommends that the Proponent clearly outline what climate factors will be monitored to mitigate or prevent adverse climate-related effects. This should include information on when and how the climate factors would be monitored and under what circumstances particular adaptive management approaches would be applied.</p>	<p>Please see response to IR-15, IR-103, IR-104, IR-235, and IR-236.</p> <p>The probable maximum precipitation (PMP) value of 493 mm selected for design of water management infrastructure, such as ponds, is similar to total annual precipitation (456 mm from Key Lake station, and 483 mm from 1981-2020 climate normals).</p> <p>The selected PMP is well above (&gt;5 times higher): 1) current/measured 24-hour maximum precipitation, 2) modelled 1 in 100 year 24-hour return for current conditions, 3) modelled 1:100 year 24 hour return for a future (2020-2050) period, 4) the predicted maximum 1-day precipitation under different emissions scenarios for the future (including RCP8.5 in the 2021-2050 period).</p> <p>For comparison to the <b>design PMP of 493 mm</b>:</p> <ul style="list-style-type: none"><li>- the measured maximum 24-hour precipitation from Key Lake station was <b>42.9 mm</b> and <b>72 mm</b> from 1981-2020 climate normals.</li><li>- the modelled existing/current 1 in 100 year, 24 hour return using the IDF_CC Tool for the Wheeler River Project site was <b>79.9 mm</b> and at the Key Lake area was <b>56.4 mm</b>.</li><li>- the modelled future (2020-2050) climate 1 in 100 year, 24 hour return using the IDF_CC Tool for the Wheeler River Project site was <b>88.6 mm</b> and at the Key Lake area was <b>62.0 mm</b>.</li><li>- the predicted future climate (2021-2050) under the highest CO2e emissions scenario (RCP 8.5) shows maximum 1-day precipitation of <b>25.9 mm</b>.</li></ul> <p>The PMP is much higher (&gt; 5 times higher) than the observed and predicted 24-hour maximum precipitation and the 1:100 year 24 hour return. Completing the design using a large PMP provides confidence that the water management infrastructure will be sufficient and function under future climates as it relates to potential changes in precipitation.</p>
AD-16	CNSC	Section 5.10 (p.70) and throughout the EIS	<p>In section 5.10 of the ES, where the seven scenarios are listed, formatting is inconsistent. Likelihood is in quotes in some places, but not in all.</p> <p><b>Not significant</b> is bolded inconsistently throughout the EIS. As well, in many cases noted as “not significant”, where others note “are not expected to have a significant effect”.</p>	<p>Suggest making formatting consistent if going to use quotes and bolding to highlight sections of the text. Also, validate that use of “not significant” and “are not expected to have a significant effect” are consistently used (where appropriate).</p>	<p>Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-17	ECCC	Appendix 6-A Air Quality Technical Supporting Document A.10	Some of the off-road vehicles have an emission rating of Tier 2 but in Appendix 6-A Section A.10 the Proponent claims that “for non-road diesel combustion, Tier 4 emission factors were assumed”. Choosing an engine with a lower Tier will increase emissions in NOx significantly and the Proponent should be using the best available technologies to minimize environmental impacts.	ECCC recommends that the Proponent choose engines that meet the most stringent emission standards to the extent possible, which are Tier 4 for the compression-ignition engines, during all phases of the Project.	Please see response to IR-139.
AD-18	ECCC	Appendix 6-C, Climate Baseline and GHG Emissions Report	Understanding Project emissions is important to inform analysis of a Project’s potential impact on Canada’s emissions targets and climate change commitments. ECCC notes that Section 4.0 and Appendix C: Greenhouse Gas Emissions Calculations of Appendix 6-C identifies the source of emissions and quantifies them in the construction, operation, and decommissioning phases of the Project, in accordance with the Draft Technical Guide Related to the SACC (Draft Technical Guide). While ECCC recognizes that the emissions will be relatively small in the post-decommissioning phase, the identification and quantification of the emissions in this phase is not found in the draft Environmental Impact Statement (EIS). The post- decommissioning phase is expected to last 15 years, likely going past 2050. The draft EIS does not discuss emission intensities of the Project, only the grid electricity. The draft EIS also does not discuss the Project’s potential impacts on Canada’s climate targets.	ECCC recommends that the identification of the sources of Greenhouse Gas (GHG) emissions and quantification of these emissions be described for the post-decommissioning phase, as done for the other phases. ECCC recommends the Proponent include discussion on the emission intensities of the mining of the product, following the guidance of the SACC and the Draft Technical Guide. ECCC recommends that the Proponent discuss the potential impacts that the Project may have on Canada’s ability to meet its climate-related targets, following the guidance of the SACC and the Draft Technical Guide.	The Post-Decommissioning phase only includes monitoring (physical, chemical, and biological) and regulatory site inspections. These activities are not expected to generate any significant GHG releases. Notwithstanding, the calculated GHG emissions estimates for Construction, Operation and Decommissioning are expected to be sufficiently conservative to capture any incidental GHG releases during monitoring and inspection activities.  The EIS anticipated an annual average production rate of approximately 4,082 metric tonnes of U <sub>3</sub> O <sub>8</sub> and an annual net GHG releases of 30,702 metric tonnes CO <sub>2</sub> e over the operations phase of the project. The annualized GHG intensity during operations is estimated at 7.5 tonnes of CO <sub>2</sub> e / tonnes of U <sub>3</sub> O <sub>8</sub> .  Section 2.5 of the EIS provides a summary of the anticipated GHG releases and a comparison to the nation- and province-wide GHG emissions. The project is expected to contribute less than 0.0043% to the nation-wide annual average. Given this very low contribution, the project is not expected to impact Canada’s ability to meet its climate-related objectives and targets.  Also see response for AD-19 (second paragraph).
AD-19	ECCC	Appendix 6-C, Climate Baseline and GHG Emissions Report	The draft EIS lacks information related to estimates of impact on carbon sinks and emissions from land-use changes. As land use shifts from a vegetated site prior to development, to an industrialized site, removal of vegetation and peat will have impacts on carbon sinks and construction emissions. Section 6, Appendix 6-C, 4.1.2 Land Use Change states that site-specific information of above- ground mass of vegetation was not available and default data from Table 20 of the Draft Technical Guide were applied. The default data is contained in this table is not applicable in this case, as they represent aboveground woody vegetation in cropland systems. ECCC recognizes that the usage of the median value of 0.51 for the carbon content is reasonable. From the information given in the draft EIS, it does not seem that the soil carbon was taken into account. In the absence of detailed information, the Proponent assumed that the area cleared would also be excavated (and drained in the case of wetland areas) which would create significant additional emissions from soil disturbances and drainage. Section 4.1.2 also states the Project involves clearing an area of	Land Use Change Regarding the lack of site-specific information of above-ground mass of vegetation, an initial site survey on-site using basic information such as site class and species would assist in determining the above-ground biomass. More specific data, such as regional data from provinces, forest companies, or literature may be available, and generic national data is available (e.g., Fo148-1-2E.pdf (publications.gc.ca), 4775.pdf (nrcan.gc.ca)). ECCC recommends that the Proponent also consider biomass that are not aboveground and confirm whether soil carbon is taken into account, as well as wetlands. Carbon Sinks ECCC recommends that the Proponent provide a quantitative and qualitative description of the Project’s impact on carbon sinks, following the guidance of the SACC and the Draft Technical Guide.	Limited site-specific data were available to characterize land use change and impacts on carbon sinks. As such, the use of default values from the SACC/IPCC in conjunction with some limited habitat/vegetation data (extracted from Chapter 9.2 Terrestrial Environment – Vegetation and Ecosystems, Listed Plant Species and Wetlands) was employed and is considered reasonable at this stage of the assessment. Please note that additional information on the land use change GHG calculations can be found in Appendix 6-C Climate Baseline and Greenhouse Gas Emissions Report.  In accordance with our discussions with the CNSC, Denison is committed to re-assessing the GHG and climate change components of the EIS and other elements of the SACC once more detailed, site-specific data becomes available (i.e., detailed feasibility and engineering studies). This is expected to include more detailed study around overall GHG emissions, carbon sinks

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
			approximately 169.6 hectares. There are no estimates on the impact on carbon sinks related to the Project.		and mitigation options, best available technologies / best environmental practices, climate resiliency, net-zero carbon planning and offsetting.
AD-20	NRCan	Section 7.3.1, Physical Geography	Drumlins and eskers in the region trend Northeast to Southwest as opposed to northwest to southeast as written on page 7, line 18. Correct orientations are used on page 7, line 23.	NRCan recommends revising the text. Please refer to 250 000 scale Surficial Geology Lines from Quaternary mapping, CSRS NAD83 Zone 13, Saskatchewan Geological Survey 2017.	Acknowledged. The typo in the draft EIS, Section 7.3.1 will be corrected in the final EIS. In Section 7.3.1. the text will be updated to say the following: “The most important associated topographic features in the region are the northeast to southwest trending drumlins and eskers...” See also response to IR-54.
AD-21	NRCan	Section 7.3.2.3, Metacrystalline Basement Rock	Pegmatite missing from list of basement rock types.	NRCan suggests addition of pegmatite to the list of basement tock types as shown on Figure 7.3-6.	Denison will update the final EIS per NRCan’s suggestion.
AD-22	NRCan	Section 7.3.3.1, Aquifer Properties, Section 7.3.2.3, Metacrystalline Basement Rock, Appendix 7A, 2.0, 2.3.1, 2.3.2	The terms “metacrystalline” and “metagranitic gneiss” are not frequently used terms in scientific literature. Gneiss is, by definition, a metamorphic rock.	NRCan suggests revision to “Crystalline Basement rocks” or “Basement metamorphic rocks”, and “granitic gneiss” as used in Figure 7.3-6. Please refer to Oxford Dictionary of Earth Sciences.	Denison will update the final EIS per NRCan’s suggestion.
AD-23	NRCan	Appendix 7A, 2.3.1, Metacrystalline basement rock	Orogeny is the process, orogen (or orogenic belt) is the feature produced by orogeny.	NRCan suggests replacing “Tran Hudson Orogeny” with Trans Hudson Orogen”.	Denison will update the final EIS per NRCan’s suggestion.
AD-24	NRCan	Appendix 7A, 2.3.1, Metacrystalline basement rock	Quartzite is by definition a metamorphic rock, and the term is used later without the meta- prefix.	NRCan suggests replacement of the term “meta-quartzite” with “quartzite”.	Denison will update the final EIS per NRCan’s suggestion.
AD-25	NRCan	Appendix 7A, 2.3.4, Athabasca Group Sandstones and Conglomerates	Sands are unlithified, whereas you are referring to grain sizes in this case.	In Table 2-1, NRCan suggests replacing the term “sands” with “grain sizes” under MFc and MFb descriptions.	Denison will update the final EIS per NRCan’s suggestion.
AD-26	NRCan	Appendix 7A, 2.3.5, Overburden	Typo on page 2, line 7: “A grain size sample was collected in GWR-033 from approximately 9 m below ground surface, and the same consisted of 8.8% clay (less than 4 µm).	NRCan suggests revision of “same” to “sample” and clay to “clay-sized” grains.	Denison will update the final EIS per NRCan’s suggestion.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-27	CNSC	Section 8.2.1.3 – Spatial and Temporal Boundaries	It is noted that McGowan Lake is an identified reference lake for the Key Lake Mill site. With the establishment of the Wheeler River mine, effluent would be flowing into McGowan Lake, which could potentially interfere with Key Lake’s environmental monitoring program by compromising McGowan Lake’s baseline conditions. Depending on the loading of COPC’s into McGowan Lake and resultant water concentrations, it may no longer be accepted as an acceptable reference lake for use by Key Lake. This would require Cameco to modify their monitoring program at the Key Lake Mill.	The CNSC advises Denison to communicate with Cameco to ensure they are aware of this situation. Coordination between the two companies may be necessary to ensure Key Lakes environmental monitoring program is not compromised. It is recommended to discuss this potential issue with Cameco ahead of time to determine the best path forward.	<p>Denison will communicate with Cameco through the Saskatchewan Mining Association to highlight the timing of the start of the Project as it may relate to Cameco's use of regional lakes for reference lake purposes. McGowan Lake will no longer be suitable as a reference lake for Cameco once the Wheeler River Project starts operating, since it will be downstream of treated effluent release. Alpha Lake (LA-9 in Denison's aquatic baseline studies) will likely be outside of any influence from Denison's activities.</p> <p>Please note that Denison has previously been in communication with the Saskatchewan Ministry of Environment, Environmental Protection Branch regarding the baseline study work Denison completed as part of the Environmental Assessment process and the potential changes to McGowan lake (a Cameco's reference lake) from the proposed Wheeler Project. Reference: Email from Janna Switzer (Denison) to George Bihun (MOE) on May 12, 2020.</p>
AD-28	ECCC	Section 8.2.4.2.3 Appendix 10-A, Section 3.1.1.2	Tables 8.2-9 and 8.2-10 in Section 8.2.4.2.3 Part II_S8 Aquatic Environment and Table 3-1 in Appendix 10-A Section 3.1.1.2 demonstrate predicted maximum effluent concentrations of Constituents of Potential Concern (COPCs) and maximum predicted receiving environment concentrations. The final effluent quality discharge target for uranium is 0.057 mg/L. However, the Canadian Council of Ministers of the Environment (CCME) water short-term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guideline, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe. While uranium is not a Schedule 4 substance with prescribed concentration limits under the Metal and Diamond Mining Effluent Regulations (MDMER), the MDMER requires the characterization of uranium concentrations in effluent under Schedule 5, and requires that all mine effluent released from final discharge points be non-acutely lethal. Under Schedule 5 Section 9(d) of the MDMER, the Proponent will likely be required to conduct selenium fish tissue sampling if average annual concentrations of selenium in effluent equals or exceeds 5 ug/L.	Discharges from the proposed Project will alter water quality in the immediate receiving area, and this may include some sublethal effects on aquatic biota, which must be minimized. It remains the Proponent’s responsibility to adhere to the MDMER to ensure that effluent at the end-of-pipe from all final discharge points be non-acutely lethal and meet requirements for prescribed deleterious substances under Schedule 4 of the regulations.	Denison fully understands its obligations with respect to the MDMER and will comply with the MDMER end of pipe effluent discharge criteria.
AD-29	CNSC	Section 8.3.3 Figures 8.3.5 etc. 8.5-4	It does not appear that aquatic baseline sampling maps for Russell Lake have LAB 1 and 2 locations showing the baseline sampling locations within Russell Lake. (Figures 8.3.5). Please update the Figures throughout aquatic environment section to include of the baseline sampling studies/ locations within Russell Lake.	Please update maps and sections in EIS to reflect aquatic baseline studies that were completed.	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-30	CNSC	EIS sections 8.4.3.2.4 Benthic Invertebrate Community and 8.4.7.6 Climate Change Considerations	<p>ECCC EEM guidance recommends the use of multiple reference areas as it offers the greatest statistical power to detect a meaningful difference between a reference area and an exposure area and can also give an indication of variability among reference areas. It is also important to incorporate multiple reference locations into the study design to aid in designing against spatial confounding factors.</p> <p>Section 3 of the Aquatic Environment Baseline Study Report details the similarities between benthic invertebrate communities by using the mean Bray-Curtis index between sampling locations and the median reference condition for the lake group size. It's not clear in the EIS if there are any issues expected to be able to use this data to compare project effect locations to references sites into the future, as some sampling locations are currently not very similar to the reference sites. In addition, climate change could affect the sediment and benthic communities in the future. The EIS states “the frequency and magnitude of extreme precipitation events have the potential to change water levels and flows in the RSA, which may affect sediment transport, deposition, and therefore benthic invertebrate habitat. Changes to average and upper and lower bounds of ambient temperatures may also affect aquatic habitat, which in turn may affect benthic invertebrate communities. Climate change over the life of the Project (i.e., 35 to 40 years) will be monitored as part of the Project’s environmental monitoring programs, and influences on water quality, sediment quality, and benthic invertebrates will require adaptive management to mitigate any potential effects of the Project that may be exacerbated by climate-related changes on the aquatic environment”. It is recommended to ensure that appropriate number/location of reference sites are sampled to enable any changes to sediment or benthic invertebrate communities that may be due to climate changes, and not project effects, are able to be assessed.</p>	<p>Considering climate change may change the lake conditions from baseline conditions, and that there is already natural variability between lakes that will be used as reference lakes and exposure lakes, it could become difficult to show changes to sediment/benthic invertebrates are not due to project activities, therefore there is a recommendation to ensure the current baseline data is adequate, and to consider if additional data, and addition of additional reference stations, will be needed moving forward.</p>	<p>Changes in landscape influence and lake conditions are not limited to those brought about by climate change. The preparation of a study design under the MDMER EEM program strives to ensure that a single reference area or multiple reference areas are as representative of a control condition as possible. Best practice is to undertake an analysis of candidate reference areas using the existing baseline information and investigate their utility as controls prior to project development. A preliminary EEM study can be completed that will allow for a Before-After-Control-Impact study design, that will provide the ability to monitor change not only in the exposure areas, but in the reference areas, thereby allowing for a reasonable assessment of potential mine related impacts.</p>
AD-31	CNSC	Section 8.4.6.1, Residual Effects Characterization	<p>The EIS states “Local Indigenous communities have expressed direct concern with respect to mercury. Mercury has not been identified as a COPC for the Project as it is currently not present in the receiving environment (i.e., background condition) at detectable concentrations and will not be produced as part of the mine process; therefore, it will not be discharged to the aquatic environment. However, it is understood that potential nutrient enrichment-related effects are possible and can be linked to increases in mercury in the environment.” Based off concerns from Indigenous communities, and the fact that phosphate is a COPC in the effluent, and elevated concentrations of mercury were measured near the</p>	<p>Please consider adding methylmercury to the environment sampling plans (such as fish dorsal muscle) in order to confirm there are no unexpected effects of the project on levels, and to satisfy stakeholder concerns.</p>	<p>Refer to response to IR-100.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
			Kratchkowsky Lake bottom, adding methylmercury to the environment sampling plans may be beneficial.		
AD-32	CNSC	Section 9.1.8.3, Appendix 10-A (ERA) section 3.2.1.5	<p>It appears there is no consistency between the assessment of soil quality in the ERA and the baseline soil sampling program presented in the EIS. The baseline program includes 10 soil permanent sampling locations (Appendix 9-B, section 2.5). Sampling at these locations is proposed to be continued during the Operation Phase, and monitoring data will be compiled and reported annually/periodically (EIS section 9.1.8.3). Conversely, the ERA estimates and predicts concentrations of COPC in soil based on atmospheric deposition. Furthermore, the location of ecological receptors in the ERA (Figure 5-2) is different from the permanent soil sampling plot locations (Appendix 9-B, Figure 2.5-1). It is unclear why measured baseline soil quality data were not discussed in the ERA and whether future monitoring data will be considered in the ERA to verify accuracy of predicted COPC concentrations</p>	<p>Please clarify how baseline measured data on COPC concentrations in soil is considered in the current and future iterations of the ERA.</p>	<p>Baseline measured soil data were used in the ERA to characterize the existing environment. The IMPACT model was used to predict the Project contributions for the Project phases above baseline. The baseline soil concentrations used in the model are provided in Section 3.5.1 and Table 3-8 of Appendix A in Appendix 10-A (ERA).</p> <p>The ERA will be revised according to the periodic review requirements in CSA N288.6-22 which will reflect ongoing data collected from monitoring programs.</p>
AD-33	CNSC	Section 9.3.3.1.2	<p>Indigenous knowledge is summarized with regard to moose, including:</p> <ul style="list-style-type: none"><li>· Calving sites close to the Wheeler River, with lots of muskeg in the area. A moose calving area is located in the Terrestrial RSA, southwest of the Project Area.</li><li>· A wildlife corridor is used by moose, running between Cree Lake (outside and to the west of the Terrestrial RSA) and Russel Lake (in the southern portion of the Terrestrial RSA).</li></ul> <p>It is unclear how this information is incorporated into the residual effects assessment.</p>	<p>Please clarify how Indigenous knowledge on moose calving sites and corridors in the RSA is incorporated into the residual effects assessment for the key indicator “moose”.</p>	<p>The sites identified by IK were explicitly considered in the impact assessment as indicated by their identification as overlapping with the Terrestrial RSA as noted in the question. However, the areas were not expressly discussed in the residual effects assessment because there is no anticipated spatial overlap of those areas with direct or indirect Project effects.</p> <p>The Indigenous Knowledge provided by ERFN and SVS (2022) identifies a moose calving site (Feature 1001-08) ~ 2 km southwest, and a wildlife corridor ~6 km south of the Project Area (as depicted in Figure 4. Map B, page 16 of ERFN and SVS 2022). Both areas are within the Terrestrial RSA but outside the Wildlife LSA. The reference to “Calving sites close to the Wheeler River...” refers to a broad area that is 45 km east of the Project Area, well beyond interactions with the Project Area.</p> <p>The presence of the areas identified through IK was acknowledged in Section 9.3.3.1.2 (Information from Indigenous Knowledge, Local Knowledge, and Engagement) in Part II, Sec. 9 of the Draft EIS. The assessment (Sec. 9.3.4.2) considered alteration and/or habitat loss at the LSA and RSA scale. Section 9.3.4.2.1 (pg. 9-210) summarizes the effects on moose habitat as follows: “Habitat alteration through sensory disturbance effects (such as noise, dust deposition, and artificial light) is expected to result in reduced habitat quality and effectiveness near Project components and infrastructure reaching beyond the Project Area into the Wildlife LSA....”</p> <p>Further, Sec. 9.3.6.2.1 (Alteration and/or Loss of Habitat, pg. 9-230) identifies that an area within a 500 m radius of the Project Area will be influenced by the Project and likely make the habitat within that area less suitable for use by moose. Therefore, the effects of the Project on moose calving have been appropriately assessed and are expected to be contained within the Wildlife</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
					LSA. That affected area does not overlap with the moose calving site or the wildlife corridor identified by IK.
AD-34	CNSC	Appendix 9-B	Baseline studies for birds are restricted to short time frames in one year only, for example: <ul style="list-style-type: none"><li>· Breeding Songbird Point Count Call Survey (June 7 and 17, 2017)</li><li>· Aerial Waterfowl and Raptor Stick Nest Survey (June 15 and 16, 2017)</li></ul> The Canadian Wildlife Service (2022) recommends: <ul style="list-style-type: none"><li>· Consider the potential effects of projects on birds throughout the year and document the distribution and abundance of birds in all seasons. Some species may be under-represented in existing data bases due to temporally restricted periods of detectability.</li><li>· Explicitly target species at risk and other focal species.</li><li>· Conduct at least two years of field surveys as a national standard for major projects, so that temporal variability can be considered in future comparisons to baseline data.</li></ul> <b>Reference:</b> Canadian Wildlife Service. 2022. Guidance Regarding Data Needed to Support Assessment of Project Effects on Birds. Environment and Climate Change Canada, Gatineau, Quebec. 80 p.	Please consider conducting surveys following CWS’s recommendations or provide an explanation as to how current baseline data for birds is sufficient to characterize the existing environment.	The data collected as part of the baseline studies for birds was focused on the habitat types and areas most likely to be disturbed as a result of the Project. Conducting additional baseline surveys for waterfowl, raptors, and breeding birds is not anticipated to result in changes to the assessment outcomes and predictions made as part of the effects assessment, which was habitat-based, for avian species. The assessment methods used a conservative approach with the assumption that following the implementation of site-specific mitigation measures, the proposed Project activities would have a residual effect on these species guilds regardless of species presence on site. However, to supplement the species data that were collected as part of the baseline field program, Denison is willing to acquire additional information on species presence in the RSA from existing sources, specifically from the Saskatchewan Breeding Bird Atlas (Birds Canada). However, collection and consideration of this information is not expected to affect the findings and/or conclusions stated in the draft EIS as the assessment was habitat-based to address all species.
AD-35	CNSC	Section 10, IMPACT MODEL	Denison discusses details of the IMPACT model but has not provided scenario(s) used to facilitate review.	Please consider providing CNSC with the IMPACT model scenario file(s) in the spirit of regulatory cooperation.	The intent of Appendix A to Appendix 10-A is to provide the inputs used for the IMPACT model as well as all of the characteristics for human and ecological receptors. Where site-specific data were not used in the model it can be assumed that default values from CSA N288.1-20 were used in the IMPACT model. As such, Denison does not intend to provide the scenario files.
AD-36	English River First Nation (ERFN)	Section 10.1.3.2, Traditional Foods Diet (p. 10-15)	The EIS States: "The ERFN is comprised of seven reserve lands across Saskatchewan" (p. 10-15). While this is accurately reflecting a source document, the source document is incorrect.	Please update to "The ERFN is comprised of seven historical settlements that have now grown into 19 different reserves across Saskatchewan"	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-37	CNSC	Section 10.1.9, Human Health Summary and Appendix 10-A – 4.4.1 Risk Estimation	The Human Health section of the EIS, as well as the ERA, indicates that there is an exceedance for selenium for the fisher/trapper receptor, with the Project estimated to contribute to the majority of this exceedance (0.93 of the HQ). While the assessment is conservative by assuming an increase intake rate of fish solely sourced from Russel Lake, the precautionary principle should be considered to ensure in reality the HQ for selenium remains below 1, even under conservative assumptions.	Please conduct of effluent, water, and aquatic organism monitoring (as already suggested in EIS) to confirm HQ's are highly conservative in the EIS modelling and receptors remain protected. Should it be determined Se concentrations are increasing in the environment at such a rate as there may be in impact to the environment or human health, installation of a selenium removal circuit into the effluent treatment process should be considered. The proponent should ensure that the proposed wastewater treatment system design incorporates the capability for expansion or upgrades in alignment with the precautionary approach, pollution prevention, and continuous improvement.	Denison acknowledges that a robust effluent and environmental monitoring program will be developed to confirm all EIS modelling predictions. The ERA will be revised according to the periodic review requirements in CSA N288.6-22 which will reflect ongoing data collected from monitoring programs.
AD-38	CNSC	Appendix 10-A (ERA)	It is unclear if measured or modelled COPC concentrations in blueberry were used in the calculations of human receptor dose. Similarly, it is unclear if measured or modelled COPC concentrations in lichen and blueberry were used in the calculations of ecological receptor dose. CSA N288.6-22, Clause 7.3.6 states that "Measured concentrations of COPCs should be used, where possible, in the exposure assessment." Please see the Clause for further information.	Please clarify if measured or modelled COPC concentrations in blueberry / lichen were used in the calculations of human and ecological receptor dose.	Measured baseline lichen data were used in the ERA to characterize the existing environment. The IMPACT model was used to predict the Project contributions for the Project phases above baseline. Measured baseline blueberry data were used for model calibration to determine if there was good agreement between measured data and modelled data. The IMPACT model was used to predict both baseline and Project contributions for blueberries. The ERA will be revised according to the periodic review requirements in CSA N288.6-22 which will reflect ongoing data collected from monitoring programs.
AD-39	CNSC	Appendix 10-A (ERA), Table 2-2	Table 2-2: Estimated Home Ranges of Selected Terrestrial Ecological Receptors Based on the reference McLoughlin et al. (2016), the Home Range for Woodland Caribou is indicated as "Expected = 80 km2" which represents the mean range sizes pooled over the two study years for calving/post-calving. The indicated Minimum (67 km2) and Maximum (267 km2), however, do not relate to the calving/post-calving stage, which is not clearly stated in Table 2-2. In contrast, these values are actually mean range size values for autumn/rut and early winter, respectively, as described in the source document on Page 83 (McLoughlin et al., 2016). It should be noted that in terms of true minimum and maximum, the source document states that individual home ranges, based on up to two years of GPS locations, varied in size from 16.2 km2 to 1363.9 km2 (Page 82 of McLoughlin et al., 2016). Reference: McLoughlin et al. 2016. Population dynamics and critical habitat of woodland caribou in the Saskatchewan Boreal Shield. Interim Project Report, 2013–2016. Department of Biology, University of Saskatchewan, Saskatoon. 162 pp. Available online at <a href="http://mcloughlinlab.ca/lab/wp-content/uploads/2019/06/2013-2016-SK-Boreal-Shield-Caribou-Project-Interim-Report-Nov-18-2016.pdf">http://mcloughlinlab.ca/lab/wp-content/uploads/2019/06/2013-2016-SK-Boreal-Shield-Caribou-Project-Interim-Report-Nov-18-2016.pdf</a>	Please provide clear details on the source of the home range values listed in Table 2-2.	Denison acknowledges the comment and will add clarification in Table 2-2 of Appendix A in Appendix 10-A that the minimum represents the autumn/rut and the maximum represents the early winter.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-40	CNSC	Appendix 10-A (ERA) section 3.2.1.5	Although the soil type selected in the ERA for modeling of atmospheric deposition to soil is sandy soil, organic soils have been delineated and characterized (section 9.1.3.3 of the EIS) as valued component (i.e., “Organic Matter/Peat”). It is unclear if the soil quality modeling performed in the ERA is protective for soil types other than sandy soil.	Please clarify if COPC modeling based on sandy soil is protective of organic/peaty soil and provide justification.	The majority of the soil in the Project Area and LSA is considered sandy soil. Section 9.1.3.2 of the EIS states "Mineral soils are associated with upland sites and (in all likelihood) anthropogenically disturbed land that, together, correspond with >99% of the Project Area and 91.5% of the LSA (Figure 9.1-8). The predominate mineral soils within the RSA have been classified as Sandy Dystric Brunisols (Smith et al. 2011)." Organic matter/peat was included as a VC in the EIS because of the concern regarding drying and losing biological function through groundwater interactions, and not in terms of assessment of soil quality. Additionally, Section 9.1.3.3 of the EIS acknowledges that organic soils is limited in the Project Area. As such, this comment is considered not applicable.
AD-41	CNSC	Appendix 10-A (ERA), Table 5-5	Table 5-5: Complete Exposure Pathways for All Selected Ecological Receptors to be Assessed using the IMPACT Model The exposure pathway for phytoplankton is stated as “direct contact in sediment”, however, phytoplankton live suspended in the water column. It is acknowledged that in the IMPACT modelling report, phytoplankton is described with an occupancy factor of 1 in water (Table 2-5).	Please add the pathway “direct contact in water” to Table 5-5 and revise all calculations accordingly.	Table 5-5 will be revised to state “direct contact in water” for phytoplankton. No calculation changes are needed.
AD-42	CNSC	Appendix 10-A (ERA), Table B.12	Table B.12: Sample Calculation – Adult Recreational Fisher/Hunter (McGowan Lake) Dose and Risk Calculations for Selenium  The source for the Terrestrial Plant Ingestion Dose for Labrador tea and blueberry is stated as “Table C.5”, however, this table could not be located.	Please provide the referred-to Table C.5 or an alternate source of information for the Terrestrial Plant Ingestion Dose for Labrador tea and blueberry.	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.
AD-43	CNSC	Appendix 10-A (ERA), Environmental Risk Assessment for Wheeler River Technical Support Document	The ERA is prepared by Ecometrix and submitted to Denison Mines. It is unclear if the ERA submitted has been reviewed and accepted by the proponent (Denison Mines).  CSA N286-12 clause 9.5.5 specifies that “the selected supplier’s technical documents that are required to be submitted shall be reviewed and accepted”.  Meeting these CSA N286-12 requirements will ensure that the proponent has control of the purchased services as a future licensee applicant.	Provide clarifications if ERA documents have been reviewed and accepted by the proponent.	See response to IR-202 which indicates that Denison reviewed and accepted the ERA. This text will be added to Appendix 10-A.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-44	CNSC	Section 11	It is not clear whether all of the interested Indigenous Nations and communities were engaged on the results and findings of the Heritage Resources Impact Assessments (HHRIA) or just ERFN?	CNSC staff would appreciate an update on any engagement activities that have taken place with regards to any of the HHRIAs for the Project, or any site or thing that is of historical, archaeological, paleontological or architectural significance as requested by other Indigenous Nations and communities to date.	<p>Denison confirms that the results of the Project-related HRIAs were discussed with ERFN, as they expressed interest in further understanding the nature of the work undertaken.</p> <p>The Saskatchewan Ministry of Parks, Culture and Sport, Heritage Conservation Branch (HCB) administers The Heritage Property Act. Regulatory approval as per section 63 of The Heritage Property Act (GS 80) was granted for the Project for the two separate HRIAs (HCB File No. 16-2102, December 14, 2017 and HCB File No. 19-933 February 12th, 2020).</p> <p>The results of the HRIAs were included and formed part of the draft EIS. Comments made by Indigenous communities on this section of the EIS will therefore be responded to accordingly by Denison, where appropriate.</p> <p>Additionally, as noted in Section 11.3.2, “The Heritage Resource Management Plan (HRMP) was informed by engagement with ERFN, who recommended that the HRMP should include a mechanism to involve Indigenous communities where appropriate (21-EN-ERFN-591.1; 21-EN-ERFN-591.2) (see Appendix 11-B).”</p> <p>The mechanism to involve Indigenous communities has been included in the HRMP and allows for general notification to Indigenous communities should an artefact be found, which provides flexibility to engage all appropriate Indigenous nations accordingly.</p>
AD-45	CNSC	Section 11.1.4.5.2. Perceived Suitability/Safe Use of Resources (p. 11-59)	The EIS States: “Section 2.6.1 in Section 2 describes the extensive review of mining methods that led to the decision to adopt the ISR mining method.” (p. 11-59). This reference is not correct, as this section does not contain a review of the mining methods.	Please update this to reflect the appropriate section.	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-46	TC	Section 14.6.7.2	<p>Transport Canada would like to clarify that although the proponent may use a third party to assist in developing emergency response assistance plans (ERAPs), it is the proponent’s responsibility to submit the ERAP application(s) to Transport Canada, per Section 7(1) of the <i>Transportation of Dangerous Goods Act, 1992</i> as follows:</p> <p>Emergency response assistance plan</p> <p>7 (1) No person shall import, offer for transport, handle or transport dangerous goods in a quantity or concentration that is specified by regulation — or that is within a range of quantities or concentrations that is specified by regulation — unless the person has an emergency response assistance plan that is approved under this section before</p> <p>(a) importing the dangerous goods;</p> <p>(b) offering the dangerous goods for transport; or</p> <p>(c) handling or transporting the dangerous goods, in the case where no other person is required to have an emergency response assistance plan under paragraph (a) or (b) in respect of that handling or transporting.</p>	<p>*This advice pertains to the regulatory phase.*</p> <p>Transport Canada notes that the sentence highlighted in yellow below is incorrect and should be revised or removed. While a contractor could assist the proponent to develop the ERAP(s), it is the responsibility of the proponent to apply to Transport Canada for approval of the plan(s).</p> <p>14.6.7.2 Design and Mitigation Considerations Principal traffic risk mitigation measures include:</p> <ul style="list-style-type: none"><li>• traffic control measures such as speed limits;</li><li>• travel management plans;</li><li>• spill and emergency response planning; and</li><li>• driver training.</li></ul> <p>Additionally, Denison considered several provisions to make sure that the effects of a terrestrial release of hazardous materials are as low as practicable. In addition to transportation mitigations listed for Scenarios 1 and 2, the following provisions were considered.</p> <ul style="list-style-type: none"><li>• The Transportation of Dangerous Goods Act, 1992 (Government of Canada 2019) outlines the requirements for entities that transport dangerous goods to establish emergency response assistance plans. These plans list specialized personnel and equipment that are required for responding to an incident. <b><i>It is expected that a contractor responsible for the transportation of uranium concentrate, fuel, and hazardous chemicals would develop these plans.</i></b></li></ul>	<p>Acknowledged. Section 14 will be updated in the final EIS to clearly state that while a contractor could assist Denison to develop the ERAP(s), it is Denison’s responsibility to apply to Transport Canada for approval of the plan(s).</p>
AD-47	Health Canada (HC)	Appendix 14-A (p. 8-9)	<p><b>Context:</b> No emergency response plan has been provided within the draft EIS, which states that emergency response plans will be developed in the future (Section 14 Appendix 14-A, p.8-9).</p> <p><b>Rationale:</b> For any emergency event, Health Canada considers the protection of human health as a primary consideration in the development of emergency preparedness and response plans.</p> <p>This includes monitoring for human health impacts and the provision of health-related guidance. Further, this will be a requirement of the licensing process.</p> <p>The proponent should ensure that the emergency response plans consider the protection of all relevant potential human receptors that could be impacted by an onsite or project-related off- site accident involving the release of chemical and/or radiological substances.</p>	<p>It is recommended that Denison develop an emergency response plan in consultation with potentially affected communities and stakeholders that includes, but is not limited to, the following:</p> <ol style="list-style-type: none"><li>1. All relevant contact information of the communities, especially related to km 160 of Hwy 914, which is the location of a cultural camp that has been established by the English River First Nation and km 67 of Hwy 914 that is a gathering location for the Kineepik Metis Local associated with the Northern Village of Pinehouse.</li><li>2. Description of the mechanisms for communication with communities in case of an emergency.</li><li>3. Description of the partnership with and the training of local communities and local responders (see Section 14 Appendix 14-B, p.1).</li><li>4. Description of mutual aid agreements with neighboring industries/municipalities, where appropriate.</li></ol>	<p>Denison acknowledges the comment and thanks Health Canada for the recommendations as to the development of its Emergency Response Plan.</p> <p>As noted in the draft EIS, Denison has committed to the development of an Emergency Preparedness and Response Program as a component of its Environmental Management System (EMS). The objectives of the program are generically consistent with the recommendations that have been provided and Denison, as it has demonstrated to date, is committed to meaningful engagement with communities of interest and will solicit input and advice during all aspects of program development.</p> <p>For reference it is noted that as it concerns its EMS framework documentation hierarchy it is expected that three levels of documentation will be developed – Programs, Plans and Procedures. The emergency preparedness and response documentation will follow this hierarchy and input from interested parties will be solicited during all phase of program/plan/procedure development. Denison intends to develop this documentation as it advances through the licensing phase of Project realization.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-48	ECCC	Appendix 16-C, Summary of Monitoring and Follow-up Programs	Appendix 16-C does not include consideration of any monitoring and follow-up programs regarding GHGs.	ECCC recommends that the Proponent consider developing a GHG follow-up program to measure and compare actual GHG emissions against the draft EIS estimates, including reporting the Project’s actual emissions and updating the emissions estimates as needed.	Denison anticipates being subject to ECCC’s reporting requirements for emitters over 10,000 tonnes CO2e and the information is collected under section 26 of the Canadian Environmental Protection Act. This was noted in the draft EIS, Section 2.5 Greenhouse Gas Emissions.
AD-49	ECCC	Appendix 16-A Summary of Residual Effects Appendix 16-B Summary of Cumulative Effects	ECCC notes that GHG mitigation measures have not been considered for the Project. Furthermore, the Project’s lifetime is expected to extend into 2050 and beyond. Consistent with the information requirements of the SACC, and aligning with Canada’s commitment to achieve net-zero GHG emissions by 2050, the Proponent should provide a credible plan that describes how the Project will achieve net-zero emissions by 2050.	ECCC recommends that the draft EIS include an assessment of potential GHG mitigation measures throughout all phases of the Project. This could include a Best Available Technologies / Best Environmental Practices (BAT/BEP) Determination, as described in Section 3.2 of the Draft Technical Guide. ECCC also recommends that the Proponent provide a credible Net-Zero Plan on how to achieve the target of 0 kt CO2 eq/year, for the year 2050 and beyond, following the guidance of the SACC and the Draft Technical Guide.	<p>GHGs were not included as a VC or KI in the draft EIS and as such, there are no specific GHG-related mitigation measures in Appendix 16. However, many of the mitigation measures for the VC Air Quality related to combustion products would also be associated with a reduction in the Project’s Scope 1 emissions. As noted in the draft EIS, Section 2.5, at this stage in the Project Denison will look for opportunities to optimize energy management and improve the energy intensity of the Project where practical. Also see response for AD-19 (second paragraph).</p> <p>Denison will consider the option of preparing a climate resiliency assessment with consideration to best available technologies / environmental practices (BAT/BEP) as well as a net-zero plan as the Project advances. Section 2.5 of the EIS provides a summary of the anticipated GHG releases and a comparison to the nation- and province-wide GHG emissions. The project is expected to contribute less than 0.0043% to the nation-wide annual average. Given this very low contribution, the project is not expected to impact Canada’s ability to meet its climate-related objectives and targets.</p>

e-Doc: 7106577

August 11, 2023

Ms. Janna Switzer  
Director - HSE Regulatory Compliance  
Denison Mines Corp.  
jswitzer@denisonmines.com

**Subject: Outcome of CNSC Staff Completeness Check of the July 14, 2023, Responses to Federal-Indigenous Review Team Information Requests for the Wheeler River Project**

Dear Ms. Switzer,

On July 14, 2023, Denison Mines Corp. (Denison) submitted responses to Information Requests (IRs) for the proposed Wheeler River Project [1]. Canadian Nuclear safety Commission (CNSC) staff have conducted a completeness check of this submission to form a conclusion on whether the required information has been provided in order to proceed with the technical review of the Environmental Impact Statement (EIS) submission. CNSC staff have deemed the submission incomplete.

CNSC staff reviewed the responses to the 238 IRs, along with any relevant proposed revisions to the EIS and supporting technical documents, as provided in Denison's list of attachments. There are 9 responses to IRs that remain outstanding.

**Overall Review**

During the completeness check, CNSC staff reviewed each IR response for consistency with CNSC staff's expectations for Denison's submission as outlined in our [March 20, 2023, letter](#) [2], including submitting:

- a revised EIS along with document revision history, in order for reviewers to locate the changes that have been made to the revised documents
- complete responses to all IRs and advice to proponent comments, while clearly indicating how responses to IRs and any subsequent changes were incorporated into the revised EIS

CNSC staff acknowledge that since the provision of this guidance, it was agreed that a revised EIS was not required for this submission, as long as Denison provided the proposed revisions to the EIS and revisions to other supporting documents for review.

Detailed feedback is provided in the attached table, appended as appendix A.

## **Information Requests (IRs)**

The main reasons for determining incompleteness of 9 IR responses included:

- response does not fully address each sub-question of the IR (4)
- information provided is insufficient to allow a technical review (4)
- the supplementary material or changes to EIS documents or Technical Support Documents provided as part of the response is/are insufficient to adequately meet the request (1)

Overall, these responses did not include sufficient information to address the original IR.

CNSC staff found that 5 of the incomplete IR responses referenced detailed information to be provided at licencing. CNSC staff previously reinforced in separate correspondence our expectation that responses to IRs must include sufficient details for subject matter experts to complete their technical assessment. Responses that additional information will be provided during the licensing phase are not adequate [3]. Summaries of detailed program information that will be provided at licencing are expected to be provided as part of the EIS and supporting documents, if required in order for subject matter experts to determine that significant adverse environmental impacts will be avoided, limited or mitigated.

### *Additional Guidance*

There are also IRs that note additional information will be updated in the final EIS (e.g., IRs# 02, 31, 71, 73, 100). The final EIS is our review step to verify that accepted responses to IRs and proposed revisions to the EIS and any supporting documentation have been properly completed. The Federal-Indigenous Review Team (FIRT) must review this information before IRs can be resolved, which is required prior to a final EIS submission. Although these IRs passed completeness, it is expected that any additional information be provided in advance of a final EIS.

No new information that hasn't been reviewed by the FIRT is to be included in the final EIS, or other supporting documents.

Of the IRs that passed completeness, please note that 7 IRs in the completeness table contain additional *Advice to the Proponent*, which relate to corrections required in the response text, guidance for the revised responses to IRs, or guidance for a future submission of responses to IRs.

## **Indigenous engagement**

CNSC staff recognize that Denison has continued to put effort into engagement with identified Indigenous Nations and communities since the October 2022 submission. As per the requirements of REGDOC 3.2.2, the Indigenous Engagement Report (IER) is an evergreen document to be updated and submitted to the CNSC as Denison's engagement activities progress. The CNSC has not received an updated version of the IER since October 2022, which contains information up to Spring 2022.

As has been communicated to Denison both verbally and in written correspondence, CNSC staff expect Denison to provide any supplementary information along with the fulsome responses to IRs, and any supporting evidence [4][5]. Further, REGDOC 3.2.2 states: "It is essential that

licensees submit all necessary and relevant information gathered pursuant to the engagement report, as this helps the CNSC to ensure an adequate Indigenous consultation process, to determine the appropriate level of Indigenous consultation activities, and to carry out an effective and efficient EA and/or licensing review” (section 4.2).

The engagement information that has occurred between spring 2022 and the summer of 2023 is information that underpins CNSC staff technical review of Denison’s engagement activities. Therefore, CNSC staff expect Denison to submit an update on engagement activities as part of Denison’s next submission. This can be provided in the form of a fully revised IER, or whatever format Denison chooses. This should include updated information on Denison’s engagement activities from Spring 2022 until the new submission date, as appropriate.

### **Commitments Report**

As noted in the email from CNSC staff to Denison on November 28<sup>th</sup>, 2022 [6] and the March 20, 2023, letter submitted along with the conclusion of the EIS technical Review [2], CNSC staff have requested that Denison submit a draft Commitments Report as part of its revised EIS documentation. This report would capture all the mitigation measures, follow-up program measures and commitments that are referenced in the Environmental Assessment (EA) documentation, in a single location for completeness and traceability. This report would remain an evergreen document that would continue to be updated during the remainder of the regulatory review process, as well as if the project is approved, after the public hearings and Commission decisions, in order to capture any additional commitments made by Denison staff during public hearings and any actions directed by the Commission to Denison.

This report has not been included along with the first round of responses to IRs. CNSC staff expect that Denison will provide a draft commitments report along with the next submission, as the FIRT must review this information before IR-2 can be resolved.

### **Expectations and Next Steps**

CNSC staff expect Denison to perform any additional work, make revisions to the submission and re-submit responses to IRs, along with any supporting documents that may have changed as a result of the revisions. Further, it is expected that the aforementioned information on Indigenous engagement be submitted along with this next submission. CNSC staff are available to hold a meeting with Denison to further elaborate on the outcome of this completeness check, and the expectations for resubmission.

Upon resubmission of a complete EA package, CNSC staff will perform a subsequent completeness check of the remaining 9 IRs and any additional supporting information. Should the next submission be deemed complete, the technical review will commence.

Should you have any questions, please do not hesitate to contact me, directly by phone at 343-540-6213 or by email at [Jessica.Way@cnsccsn.gc.ca](mailto:Jessica.Way@cnsccsn.gc.ca).

Sincerely,

Jessica Way  
Environmental Review Officer  
Environmental Review Division

Appendix A

Wheeler River Project Completeness Check: Review of Denison Responses to Information Requests (IRs)  
and Supporting Documents Received July 14, 2023

Reference #	Status	Rationale	Context and Information Required for a Complete Response
Reference #: IR-1	Complete: Yes		
Reference #: IR-2	Complete: Yes		<p><b>Advice to the proponent:</b></p> <p>The response notes that: “A list of commitments, including specific commitment or mitigation measures related to Project effects as an outcome of engagement, made in the draft EIS, throughout the Federal information request period and the Provincial comment response period, will be included with the submission of the final EIS. For clarity, this would not include any private, confidential accommodations made under contractual agreements.”</p> <p>CNSC staff expect that a draft commitments report be provided in a submission for staff to review during the technical review process. It is not sufficient to provide this at the final EIS step. CNSC staff recommend that Denison provide a draft commitments report along with the next submission. If this is not provided along with the revised responses to incomplete IRs, it will be expected at a later phase of the technical review process, as this IR cannot be resolved until the draft report has been received.</p>

Reference #: IR-13	Complete: Yes		<p><b>Advice to the proponent:</b></p> <p>The Final EIS Updates column highlights the following change to EIS text: “Based on the current wellfield and freeze wall design, approximately <del>150</del> 2,000 m3 of special waste rock will be generated.” This change appears unrelated to the IR response, and it is unclear why the size has increased from 150 to 2000 m3.</p> <p>CNSC staff expect that none of the information that has been previously provided in the draft EIS, currently under technical review, will change unless the revisions are the result of an IR. Further, any revisions to draft EIS text must be reviewed before a final EIS can be provided. No new information can be provided in the Final EIS.</p>

Reference #: IR-39	Complete: Yes		
Reference #: IR-40	Complete: Yes		
Reference #: IR-41	Complete: Yes		
Reference #: IR-42	Complete: Yes		
Reference #: IR-43	Complete: Yes		
Reference #: IR-44	Complete: No	<b>Rationale:</b> The information provided is insufficient to allow a technical review.	<b>Context and Information Required for a Complete Response:</b> The response does not provide details of the noise complaints resolution and response procedure as per <a href="#">Health Canada</a> (2017).  As noted in section 9.3 of the CNSC’s Generic EIS Guidelines, the EIS will “describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the proponent intends to implement them and the environmental outcome the mitigation is designed to address”.  A response that the requested information will be provided as part of the licensing efforts is not a sufficient response. Although a fully detailed monitoring and follow-up plan is not required at this stage, the information in the draft EIS lacked the level of detail required in order for the reviewer to complete their technical review.  Please provide a complete response with sufficient detail for reviewers to complete their review.

Reference #: IR-133	Complete: Yes		
Reference #: IR-134	Complete: Yes		
Reference #: IR-135	Complete: No	<b>Rationale:</b> The response does not fully address each sub-question of the IR.	<b>Context and Information Required for a Complete Response:</b> The response does not provide details on noise and other sensory disturbance monitoring and mitigations if noise levels surpass thresholds. The response also makes reference to Section 6.2.5 and 6.2.8, which Denison considers an appropriate level of supplemental information to support the IR.  While the draft EIS broadly discusses mitigation measures and monitoring and follow-up activities, the information in section 9 lacked the level of detail required in order for the reviewer to complete their technical review. Further, it is expected that responses to IRs be self-contained, which means that the response itself should summarize the key elements of this information and demonstrate how the information fully address the IR, as opposed to reviewers having to look and identify which information is relevant to their question.  Please provide a complete response with sufficient detail for reviewers to complete their review.

Appendix A to Denison's Response to FIRT Round 4 Wheeler  
River Project EIS Comments

October 18, 2024

IR-12

- Department: ECCC
- Project Effects Link: Change to an environmental component due to hazardous contaminants
- Reference to EIS, appendices, or supporting documentation: Section 2.2.3, Project Description

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, July 9, 2024)	IR (ROUND 4, Sept.6, 2024)	Denison Response (ROUND 4, Sept. 16, 2024)
IR-12	-	Context: There is not enough information provided within the draft EIS and site water infrastructure designs to determine if the infrastructure will sufficiently contain mine site contact and noncontact water runoff. It is unclear how water management will occur during all proposed Project stages at the Project airstrip, which is located away from the main Project site. No information has been provided regarding water that may come into contact with fuels and oils from machinery on the air strip, how and where that contaminated water will be treated, and how surface runoff around the airstrip will be managed. Additionally, it is unclear if contaminants from heavy machinery on roads have been considered during runoff collection plans throughout the mine Project site. Water management at the airstrip and roads can have impacts on surface water quality and sediment quality and contaminants (e.g., Hydrocarbons) from these sources should be considered in overall site water management plans. In Section 2.2.3.1 a site drainage plan for contact and non-contact water has been provided in Figure 2.2-17, and water balances have been provided for the different Project phases in Figures 2.2-14 to 2.2- 16. In Section 2.2.3.4 a volume of 30,000m3 for the process water pond is provided, and it is stated that the process water pond has the capacity to contain Probable Maximum Precipitation (PMP) event estimated to be 483.3mm while allowing for 1.0m of freeboard. However, there are no estimates on the total volume of water that may be drained from the overall site infrastructure (i.e., the well field, processing areas, etc.) during a 24-hr PMP event. Additionally, in Figure 2.2.17 culvert locations are provided, however there is no further information on culvert designs, flow ratings and capacity for PMP events. Rationale: In order to be able to understand	1. Provide information on how contact and non-contact water from the site airstrip will be managed. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment. 2. Provide further information on how potential contaminants in runoff from roads have been considered in the site water management. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment. 3. Provide estimated volumes of water to be drained from overall site infrastructure (such as the mine terrace, airstrip, camp area etc.), during a 24-hr PMP event. 4. Provide additional information on culvert designs and conveyance capacity for PMP events.	1. and 2. Denison's approach to site water management is keep non-contact water “clean” – that is, the management approach provides that non-contact water does not come into contact with site aspects that may impart constituents/contaminants of concern and that non-contact water mingles with contact water. Contact water is water expected at the wellfield and processing plant terrace (refer to runoff collection arrows shown in draft EIS Figure 2.2-17), and also includes leachate collected from landfills. As such, runoff from the airstrip and site roads is considered non-contact water and will not be actively managed. However, should a spill occur, the spill response plan will be followed. Details of Denison's response plans will be developed to support licensing as part of the Waste Management and Emergency Management and Fire Protection programs. By following best practice and mitigation measures outlined in the EIS, Denison does not anticipate a need to continually manage water at the airstrip or along site roads as the water here will be clean, non-contact runoff. Examples of relevant mitigation measures include: <ul style="list-style-type: none"><li>• Project components including equipment and machinery will be regularly maintained and inspected to make sure they are in good working order.</li><li>• Fuel storage and distribution infrastructure will be constructed in accordance with applicable legislation requirements.</li><li>• Fuels will be stored in approved, above-ground, double-walled storage tank(s) equipped with secondary containment in accordance with provincial regulations and standards.</li><li>• A wash bay will be available to clean items, equipment, and vehicles that may have been in contact with potential contaminants.</li></ul> Refer to Section 14 of the draft EIS for the screening and evaluation of various accident and malfunction scenarios. Should unplanned events or conditions occur, it will be important for Denison to address and respond in an appropriate manner. Details of Denison's response plans will be developed to support licensing as part of the Waste Management and Emergency Management and Fire Protection programs. Additionally, should unexpected water pooling be observed at the airstrip or site roads during Operation, temporary water removal means such as vac trucks or sump pumps could be employed and the areas would be re-graded to minimize water accumulation. 3. As indicated in the response to IR-12, points 1 and 2 above, Denison expects contact water requiring management is at the wellfield and processing plant terrace (refer to runoff collection arrows shown in draft EIS Figure 2.2-17). For this area, the volume of water expected during a 24-hour PMP of 493 mm is approximately 37,240 m3. The wellfield runoff pond has been sized appropriately (38,200 m3 with 1 m of freeboard) to contain this volume of water. 4. Details related to culvert design and conveyance capacity are being developed as part of ongoing	This response has not been accepted, for the following reasons (numbers correspond with original IR): 1-2. In Figure 2.2-17 (Site Drainage Plan with Flow Direction and Culvert Locations) of EIS, site drainage or water management layout is not included for the access road to the airport and the airport area although they constitute part of the Project site. Although surface run off from airstrip or site road are mainly expected to be clean or non-contact water, CNSC expects Denison to provide information on water management system to mitigate risk of flooding and erosion at the airport and the access road. In addition, the access road connecting the mining site with airport crosses two streams (Kratchkowsky Creek and Hart Creek) that flow into Whitefish Lake, CNSC staff expects Denison to ascertain that culverts or crossings will be designed in such a manner that the flood hazard does not increase. Therefore, CNSC staff request that Decision provide information on how the surface runoff generated at airstrip and airport access road would be managed. 3. CNSC accepts estimated total volume of runoff from the wellfield area to Wellfield Pond however the PMP value of 489.3mm is obtained from 1999 study [A.1], based on historical rainfall data pre-1998, which appears to require updated PMP value. CNSC requests that Denison use a PMP value that is estimated using historical rainfall data that includes the most up to date meteorological data or provide justification on the validity of the current PMP. Further, the site infrastructure runoff water has not been considered in the water management infrastructure. Site water management planning should consider the capture of noncontact water to understand the potential effects of contaminants from non-contact water on the surrounding environment. Please also see follow-up IR-12-R1A and IR-12-R1B, related to this IR. Reference: [A.1] Atmospheric & Hydrologic Sciences Division – Atmospheric Environment Branch. 1999. Environment Canada Prairie & Northern Region – Point Probable Maximum Precipitation for the Prairie Provinces. Regina, Saskatchewan. Report No. AHSD – R99 – 01.	1-2. The water management design information presented in the draft EIS is considered appropriate at the EA stage and for this stage of the Project and fit-for-purpose to support the assessment of potential effects. The detailed design information on site water management infrastructure and runoff management requested in this IR and related IRs (i.e., IR-12-R1A and IR-12-R1B) will be provided to the CNSC and province as part of licensing and permitting. Nevertheless, and building on information provided previously, additional information and context regarding site water management and design concepts is provided as follows: <ul style="list-style-type: none"><li>• Conceptual site drainage maps spanning the full Project Area scale has been provided in Attachment IR-12 to this IR response table as context for the reviewer.</li><li>• Design for the access roads and airstrip will in general be such that runoff will be encouraged through appropriate grading to drain away and not pond on or near the road or airstrip.</li><li>• The overall vision for non-contact water along the access roads and airstrip is to use shallow ditching to dissipate the energy of runoff, to promote settling of suspended solids and allow the runoff to report to ground via natural grades that flow away from the infrastructure and into the natural drainage systems.</li><li>• The condition of the airstrip and roads would be inspected and maintained routinely. For example, should unexpected water pooling be observed at the airstrip or site roads during Operation, temporary water removal means such as vac trucks or sump pumps could be employed, and the areas would be re-graded to minimize water accumulation.</li><li>• Infrastructure features that are within 50 to 100 m (depending on grade) of waterbodies and that are associated with cleared land where there is no vegetated buffer may require additional erosion management / controls to ensure protection of the waterbodies from unmitigated suspended solids inputs. A map showing the distance of Project components to waterbodies is available in Attachment IR-12 as context for the reviewer. The map shows for example, that four waterbodies (waterbody numbers 1, 16, 23, and 86) are within 100 m of the Project footprint where potential erosion protection measures may be employed. The details of erosion control measures at these locations will be outlined in the Environmental Management System to support licensing.</li><li>• Conceptually, minimizing changes in surface drainage patterns and watersheds is an important mitigation measure in the surface water quantity assessment. Collecting and managing non-contact water along roads and at the airstrip would result in a larger potential Project effect on surface water quantity associated with changes in surface drainage patterns and is not preferred.</li><li>• As described in the draft EIS, the proposed crossings at Kratchkowsky Creek and Hart Creek are not culverts, but clear span bridges. Clear span bridges are designed to completely span</li></ul>	Item one of the IR has been accepted, but a follow-up item of advice can be found within the Advice to the Proponent table [reference to come].  There is outstanding information required to resolve item two. The Proponent did provide the requested proposed water management structures in Attachment IR-12; however, for the road to airstrip and the airstrip, the water management strategy does not include any containment structures or information about runoff quality.  Contaminants may be contained in non-contact water from all site infrastructure, including the airstrip, roads, and the camp area. This information is required in order to make a determination on significant adverse effects, as it relates to potential impacts to water quality and fish, which are assessed as part of the EA process.  The Proponent should confirm that the proposed water management structures, for the roads, camp pad, operation, substation and airstrip, will be included in the Final EIS. The Proponent should also describe how quality of runoff from infrastructure will be monitored, and what proposed mitigation and management measures will be taken if necessary.  <i>With regards to items three and four, these have been accepted for the purposes of the current EA process, and the outstanding issues below will be further assessed as part of licensing technical reviews, prior to the granting of a license.</i>  Denison is expected to address the following: <ol style="list-style-type: none"><li>3. From FIRT's Information Request Rationale (2023-12-05): CNSC requests that Denison use a PMP value that is estimated using historical rainfall data that includes the most up to date meteorological data or provide justification on the validity of the current PMP.</li><li>4. From Denison submission of responses to IRs (2023-08-18): Details related to culvert design and conveyance capacity are being developed as part of ongoing engineering activities. Culverts will be a designed with a sufficient size and length to convey water around the site during a PMP event.</li></ol>	Refer to Attachment IR-12, IR-12-R1A, and IR-112-R1B (Round 3) below.	In a supplementary submission provided by Denison on July 9 <sup>th</sup> , 2024, much of the information requested has been provided.  Table 1 of round 3 attachment IR-12 is a screening of constituents of potential concern (COPCs) in water catchments. For the “Camp” catchment, risks to the aquatic environment from nutrients is described as “None expected.” However, sewage spills occur occasionally at camps and would release nutrients which could reach the aquatic environment.  Also in Table 1, a management/mitigation often referred to is, “A wash bay will be available to clean items, equipment, and vehicles that may have been in contact with potential contaminants.” No further details were found on how wash bay water will be handled such that it does not pose a risk to the aquatic environment.  The Proponent is relying on its spill response plan to handle any spills from the freeze plant and substation as well as the camp. Section 14 of the EIS, Accidents and Malfunctions, does not discuss these hazards. Given the stated reliance on the spill response plan for brine and sewage spills on site, it will be important that the plan explicitly address brine and sewage spills.  <i>In order to resolve this IR, Denison are expected to:</i> <ul style="list-style-type: none"><li>• Include nutrients from sewage as a contaminant of potential concern for the Camp Watershed in Table 1 of round 3 attachment IR-12 or provide justification why there are no risks to the aquatic environment from nutrients from the camp.</li><li>• Clarify how wash bay water will be handled, given that it may potentially contain contaminants.</li></ul> The following will be assessed during licensing: Denison will be expected to incorporate information provided in this supplementary submission in the Spill Response Plan.	In response to this IR, the Site Water Management Plan has been updated using track changes; see Attachment IR-12, IR-12-R1A, and IR-112-R1B (Round 3) below. Briefly for context, nutrients as a COPC related to sewage in the Camp Watershed have been incorporated into Table 1, and clarification with respect to the wash bay water management has been provided.  In addition, responses to the CNSC's round 4 comment related to nutrients, the wash bay, and commitments for the Spill Response Plan are also provided here.  <b>Nutrients:</b>  The domestic wastewater treatment plant pond stores treated domestic wastewater prior to conveyance to the process water pond that reports to the industrial wastewater treatment plant (IWWTP). To clarify, the accidents and malfunctions assessment (EIS Section 14) considered four scenarios that could introduce COPCs to the environment from site “ponds and retention berms” (see Table 3-13, Appendix A or EIS Appendix 14-A), including overtopping, flooding and containment failure – the domestic wastewater treatment plant pond would fall into this generic “ponds and retention berms” category. The “ponds and retention berms” scenarios were deemed low risk or risks were deemed to be as low as reasonably practical (ALARP), given design and other mitigations.  <b>Wash Bay:</b>  Described in Section 2 of the EIS, a wash bay is proposed as part of the Wheeler River Project infrastructure. The wash bay will be available to clean items, equipment, and vehicles that may have been in contact with potential contaminants. The wash bay area will have an impermeable floor and a lined water collection sump. Rinse water from the wash bay sump will be routed to the wellfield runoff pond or directly to the process water pond. It will be subsequently conveyed as a component of the influent stream to the IWWTP where it will be treated. Treated effluent would be discharged to Whitefish Lake once deemed suitable for release.  For the purpose of the site water management strategy, water derived

		site water management and flood risk potential, more information needs to be provided regarding the site water infrastructure designs and capture volumes during PMP events. This information will aid ECCC in understanding how contact and non-contact water will be conveyed throughout the site. Runoff from roads and the site airstrip will contain contaminants from vehicles, heavy machinery, aircrafts and de-icing practices. Additional information on the runoff collection systems and expected contaminant concentrations for the site airstrip and roads is needed to determine if the receiving environment and aquatic and terrestrial receptors are protected.		engineering activities. Culverts will be a designed with a sufficient size and length to convey water around the site during a PMP event.		<p>a watercourse without interfering with the channel bed and banks.</p> <ul style="list-style-type: none"><li>As a reminder to ECCC that the road to the Project’s proposed airstrip follows an existing, decommissioned road, the Fox Lake Road.</li><li>The Project is located within the Wheeler Upland Landscape Area of the Athabasca Plain Ecoregion within the Boreal Shield Ecozone of Saskatchewan. The area is characterized by Brunisolic soils which are typically sandy, well-drained soil. Standing water is not a common occurrence and the well-drained characteristics of the region support the plans to divert non-contact water to ground, and as noted made surfaces would be graded to promote drainage and discourage pooling.</li><li>Please refer to our initial response to IR-12 (refer to Annex 1, IR-12 on page 6/419) for additional context on best practice and mitigation measures related to water management and also the scoping and evaluation of accident and malfunction scenarios in the draft EIS.</li><li>Importantly, the conceptual management scheme outlined above for non-contact water runoff is consistent with other roads and airstrips in the region – that is, runoff is not currently captured from other roads and airstrips in the region as envisioned by the review comment. This includes infrastructure associated with Saskatchewan Ministry of Highways and Infrastructure, existing uranium mines and mills, and communities including First Nation communities. It is not practical to do so and collection of non-contact water is not needed based on risk and moreover as noted above is to be avoided so as not to necessarily affect water quantity in local drainages and sub-drainages.</li></ul> <p>3. The reviewer is referred to the response to IR-103 for a discussion regarding the PMP and its suitability and relevance given available data and different methods of calculation included that provided by CSA guidance. Notwithstanding the information provided in response to IR-103 Denison is committed to revisiting this issued as per CNSC’s recommendations, as applicable, for the licensing phase of the Project.</p> <p>To reiterate, Denison believes it has fulfilled its information requirements for the EIS as outlined in the EA guidance provided by the province and federal government, including CEAA 2012, and that the FIRT has been provided with the appropriate level of detail on the water management topic for drawing conclusions on the EA process. Notwithstanding that, Denison recognizes that further information will be required as the Project moves past the EA and into the licensing and permitting phases. It is Denison’s opinion that this comment is not an IR related to the EIS. A request for clarification or additional information on a detailed design aspect would need to be responded to by the Denison as part of the licensing process; however, this level of detail is not necessary for drawing conclusions on the EA process.</p>			from the wash bay is by definition “contact water”.	
n/a	IR-12-R1A	Context: Runoff water from site infrastructure such as the airstrip and roads may be categorized as non-contact water because it does not come into contact with contaminants of potential concern	n/a	n/a	<p>1. Provide updated estimates of water volumes to be drained and managed from overall site infrastructure (including runoff</p>	<p>1 and 2. Denison understands the prohibition related to deleterious substances under Section 36 of the Fisheries Act and Denison affirms its commitment to ensuring no such events occur. However, in the context of this IR, we interpret ECCC is connecting the concept of deleterious substances under MDMER (those constituents identified in Part 1(3) i.e., arsenic; copper; cyanide;</p>	<p>The Proponent has not adequately answered either part of the IR.</p> <p>An updated site water management plan that includes the management of all water that has been in contact with project infrastructure and updated estimates of water volumes to</p>	Refer to Attachment IR-12, IR-12-R1A, and IR-112-R1B below.		

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, July 9, 2024)	IR (ROUND 4, Sept.6, 2024)	Denison Response (ROUND 4, Sept. 16, 2024)
		<p>(COPCs) directly from mining operations infrastructure. However, it still has the potential to contain deleterious substances from mine-related activities such as operation of vehicles, including heavy machinery and aircraft, spills, fire management practices, and snow removal practices. The Metal and Diamond Mining Effluent Regulations (MDMER) pursuant to the Fisheries Act requires all mine effluent and seepage from the mine site that contains deleterious substances be discharged through a final discharge point. This includes deleterious substances in non-contact water from all site infrastructure including the airstrip, roads, and camp area.</p> <p>Rationale: All mine effluent and seepage that contains deleterious substances must be discharged through a final discharge point. This includes site non-contact water which has the potential to contain deleterious substances such as those released from vehicles, machinery, aircrafts, spills, and de-icing practices. The Proponent has not included how non-contact water runoff from site infrastructure will be captured within site water management planning. To understand the potential effects of contaminants from non-contact water on the surrounding environment, site water management planning needs to be updated to include the capture of non-contact water.</p>			<p>from roads, airstrip, camp area, etc.) during the different Project phases. Include updated information on water treatment flows, capacity and effluent discharge during normal operations, and a 24-hr Probable Maximum Precipitation (PMP) Event.</p>	<p>lead; nickel; zinc; suspended solids; radium 226; and un-ionized ammonia.) with the general concept of deleterious substance per the Fisheries Act. Mine effluent associated with MDMER defined deleterious substances will be discharged through a final discharge point to Whitefish Lake, and this has been reflected in the water management information presented in the draft EIS, including Section 2.2.3. The IR is suggesting Denison collects runoff water from the airstrip and roads with the rationale that this is needed in order to collect potential contact water associated with hydrocarbons spills (the text in rationale notes: This includes site non-contact water which has the potential to contain deleterious substances such as those released from vehicles, machinery, aircrafts, spills, and de-icing practices). As indicated in the draft EIS and in our initial response to IR-12 (refer to Annex 1, IR-12 on page 6/419), should a spill occur, the spill response plan will be followed. The details of Denison's response plans will be developed to support licensing as part of the Waste Management and Emergency Management and Fire Protection programs. Importantly, hydrocarbons are not mine waste-related deleterious substances perm MDMER definition. Collecting and treating non-contact runoff throughout the life of the Project would mean Denison collects an extremely large volume of clean water to protect against infrequent hydrocarbon spills which will be cleaned up in the appropriately scaled process (spill response), in terms of cost and risk to the environment. No other roads or airstrips in the region (including those associated with uranium mine and mill operations) requires the collection and treatment of runoff water from infrastructure such as roads and airstrips. It is not practical to do so and based on risk, the collection of non-contact water is not required. The road or trail to the airstrip is currently an unmaintained road: the decommissioned Fox Lake Road. For road upgrades and airstrip construction, Denison will be using material from the borrow area. Borrow pit area selection was based on geotechnical program completed in 2021 which did not identify any potential for ARD/ML. Further works are ongoing part of engineering activities and with confirmation of characterization through assays of representative samples. As such, the material used to upgrade roads and construct the airstrip will not be a source of metals or ARD. Denison will implement erosion control measures at infrastructure locations within 50 to 100 m of a waterbody (refer to response to IR-12 above and to Attachment IR-12, Figure IR-12-5: Distance from Project Footprint to Waterbodies) where required (i.e., at locations where there is no vegetated buffer adjacent to the waterbodies). In consideration of the above, Denison maintains that the runoff at the airstrip and roads are non-contact water. The water management mandate for the Wheeler River Project is to keep clean water clean and minimize the total volume of water requiring management, treatment, and discharge. In the draft and revised draft EIS, Denison has evaluated potential Project effects on surface drainage in Section 8.1, as part of the Project-surface water quantity interaction of Project overprinting of drainage areas. As noted in the draft EIS, Section 8.4.1.4.2.1, this assessment was appropriately focused on areas of active water collection. It was noted that the road and airstrip were not considered to affect hydrology materially. Both may potentially redirect some flow and have a small influence on the timing of concentration of runoff and infiltration rates; however, in general, they are anticipated to have a very small influence and are not expected to change runoff volumes at assessment nodes.</p>	<p>be drained and managed from overall site infrastructure (including runoff from roads, airstrip, camp area, etc.) are required to understand the potential effects of contaminants on the surrounding environment. The Proponent should include updated information on water treatment, flows, capacity and effluent discharge during normal operations, and a 24-hr Probable Maximum Precipitation (PMP) Event.</p>

## **Attachment IR-12, IR-12-R1A, IR-12-R1B (Round 3 [with updates from Round 4 in track changes](#))**

In response to IR-12 and related IRs 12-R1A and 12-R1B Denison offers the following that has been divided into two parts.

In **Part 1**, an updated site water management plan is presented commensurate with the stage of the EA process for Wheeler River Project (or Project). That is, the site water management plan is largely conceptual at this time; however, Denison is able to provide additional information that builds on information presented previously in the EIS and supporting documentation including Round 1 and Round 2 IR responses as the Project-related engineering design process is advancing in parallel with the EA.

In **Part 2**, Denison has prepared specific responses to specific questions raised in IRs 12, 12-R1A and 12-R1B that are not necessary fully described by Part 1 of the response.

### **Part 1 – Wheeler River Project Site Water Management Plan**

#### **Introduction**

The following conceptual Site Water Management Plan (SWMP, or Plan) has been prepared in response to the third round (May 2024) of Federal Indigenous Review Team (FIRT) information requirements (IRs) regarding the Wheeler River Project (Project) Environmental Impact Statement (EIS) submission, [as well as the comments provided by CNSC on the Round 3 comment/disposition submission](#). The information offered herein builds on information provided previously by Denison Mines (Denison) in the EIS, its supporting documents, and responses to [Round 1 \(March 2023\) and Round 2 \(November 2023\)](#) FIRT IRs.

As noted, the Plan builds on information provided previously by Denison; but further seeks to consolidate this information into once place for ease of reference, as well as provide additional water management related detail that has been developed as Project-related engineering design has been advancing in parallel with the environmental assessment process. The Plan describes the SWMP design concept, its design basis, the delineation of so-called “contact” versus “non-contact” water management areas on the Project site, water management structures / infrastructure, the quantities of water that would be expected to be managed within the water management areas under normal and event-related conditions and monitoring.

The SWMP is provided with a conceptual level of detail and information commensurate with the stage of development of the Project and advancement of engineering design. Further detail and documentation, including engineering design to support construction, regarding site water management will be developed as the Project moves from the environmental assessment (EA) process into permitting and licensing, initially for site preparation and construction, subsequently for operations and ultimately for decommissioning.

#### **Design Concept**

The Project's design concept related to site water management is to keep clean water clean and minimize the total volume of water requiring more active management, treatment, and discharge. Denison will achieve this by 1) diverting clean, non-contact runoff around Project components and 2) collecting contact water for treatment in the Industrial Wastewater treatment Plant (IWWTP), and eventual release to Whitefish Lake. In general terms and within the context of this Plan, the following definitions are provided for contact and non-contact waters:

- Contact water is potentially contaminated as the result of interaction with Project process/structures/infrastructure and therefore requires management through site water infrastructure and conveyance to the IWWTP prior to controlled release to the environment.
- Non-contact water is suitable for direct release to the environment with appropriate, conventional best management practices and mitigation measures.

The rationale for the distinction of the two water types and management strategies is primarily associated with the desire to affect local hydrology as little as possible by only diverting runoff from natural catchments and sub-catchments where it is deemed necessary to protect water quality. Conceptually, minimizing changes in surface drainage patterns and watersheds is an important mitigation measure in the surface water quantity assessment. Collecting and managing non-contact water would result in a larger potential Project effect on surface water quantity associated with changes in surface drainage patterns and is not preferred.

### **Design Basis**

For the purpose of contact and non-contact water management, the following design bases have been assumed.

For the contact water portion of the system, all water management structures/infrastructure would be designed to contain an event equivalent to 493 mm of precipitation over a 24-hour period (herein referred to as the 24-hour probable maximum precipitation (PMP) event). By definition, events exceeding this magnitude would be conveyed to the environment through purposely built emergency spillways so that the structural integrity of the structures/infrastructure would be maintained and not result in further event related consequences. For context, this volume of water is greater than the average annual precipitation recorded at nearby Key Lake (refer to Appendix D to Appendix 6-C) for the period 2011 through 2020 that was 456 mm. [Additionally, as described in Section 2 of the EIS, a wash bay is proposed as part of the Wheeler River Project infrastructure. The wash bay will be available to clean items, equipment, and vehicles that may have been in contact with potential contaminants. For the purpose of the site water management strategy, water derived from the wash bay is by definition "contact water" \(i.e., fits the definition of contact water above\), despite the fact that the wash bay is associated with the "camp" area and is not considered in the screening of non-contact water sources below for that reason. The wash bay area will have an impermeable floor and a lined water collection sump. Rinse water from the wash bay sump will be routed to the wellfield runoff pond or directly to the process water pond. It will be subsequently conveyed as a component of the influent stream to the IWWTP and treated. Treated effluent would be discharged to Whitefish Lake once deemed suitable for release.](#)

For the non-contact water portion of the system, all water management structures/infrastructure would be designed to withstand an event equivalent to 89 mm of precipitation over a 24-hour period (herein referred to as the 24-hour intensity-duration frequency (IDF) event). This event is the 1 in 100 year return event and was calculated utilizing the publicly available web-based intensity-duration-frequency tool that is pre-loaded with [data from](#) 898 Environment and Climate Change Canada rain stations. This number was derived based on the projection of conditions for the period 2020 - 2050 for the Wheeler River Project site coordinates and therefore considers the time period that overlaps with the time period when water is likely to be actively managed on the site (i.e., construction, operation, initial phase of decommissioning).

### **Delineation of Catchments Areas**

For the purpose of defining water management areas / nodes within and adjacent to the Project site, a series of maps delineating catchments areas based on local topography and drainage patterns have been developed. The delineation of key catchments at the Project site is shown in Figures 1 to 5 below.

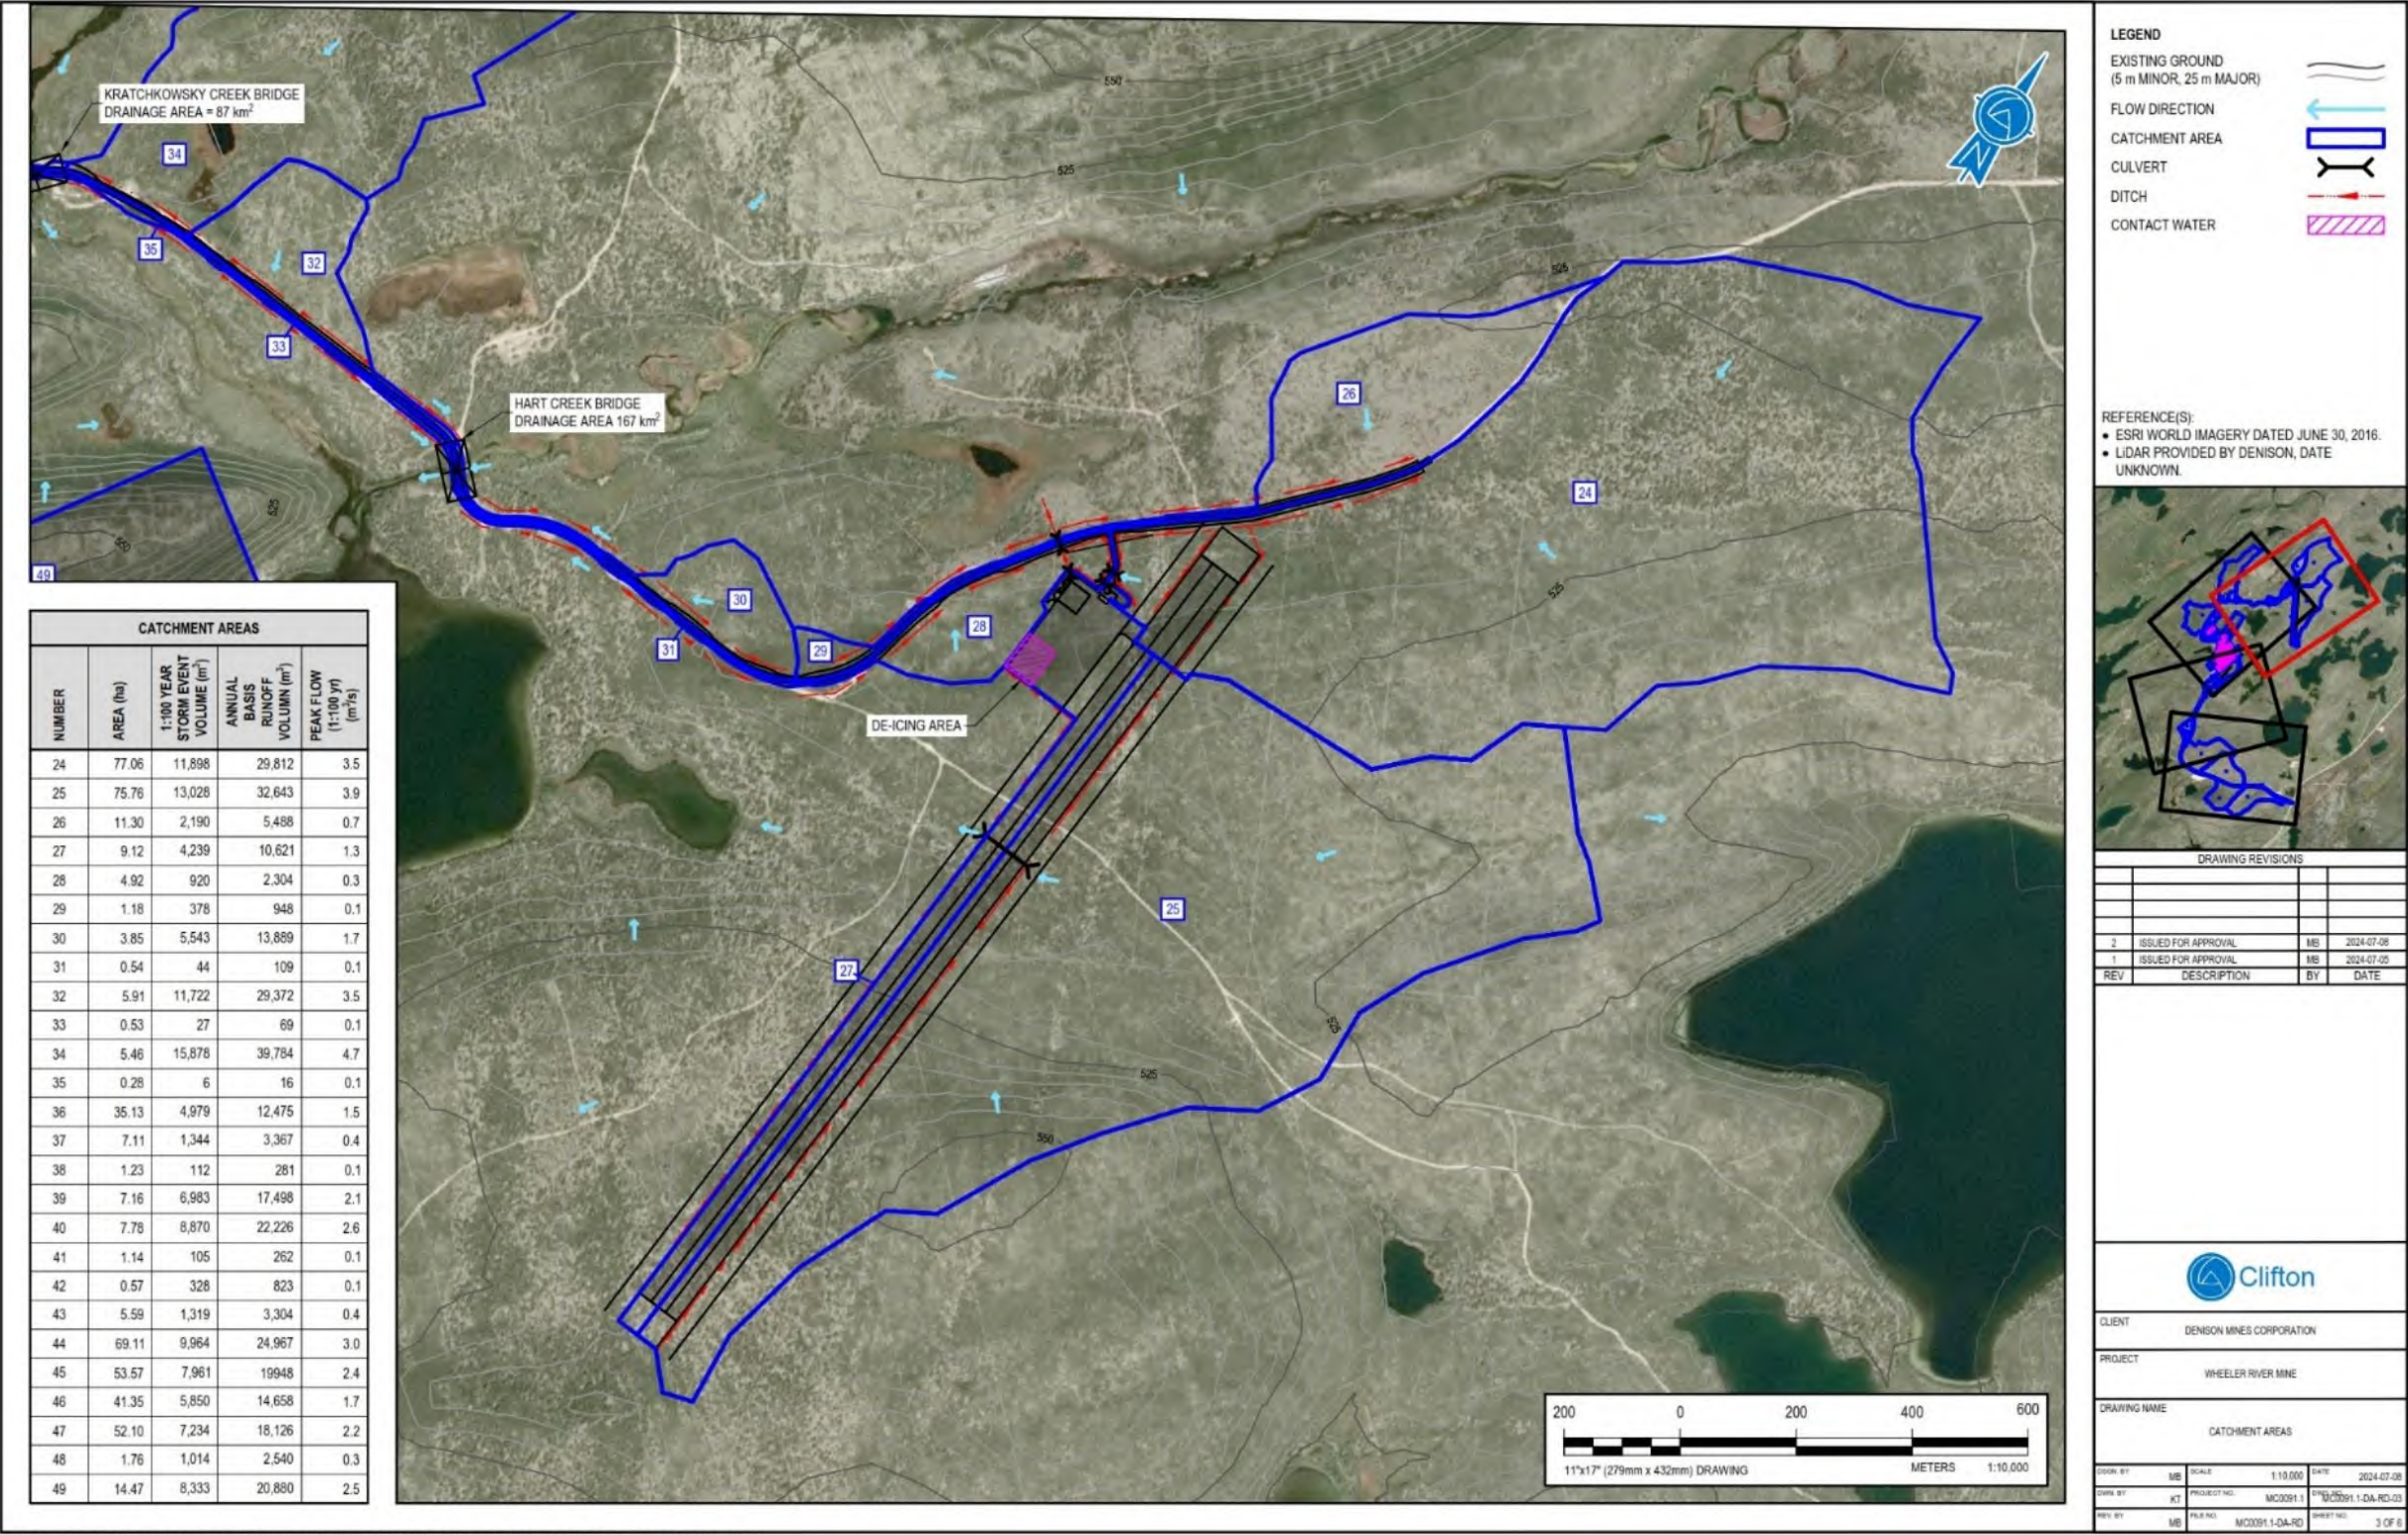

Figure 1: Site water management catchment areas – layout 1 of 5: Airstrip and portion of airstrip access road

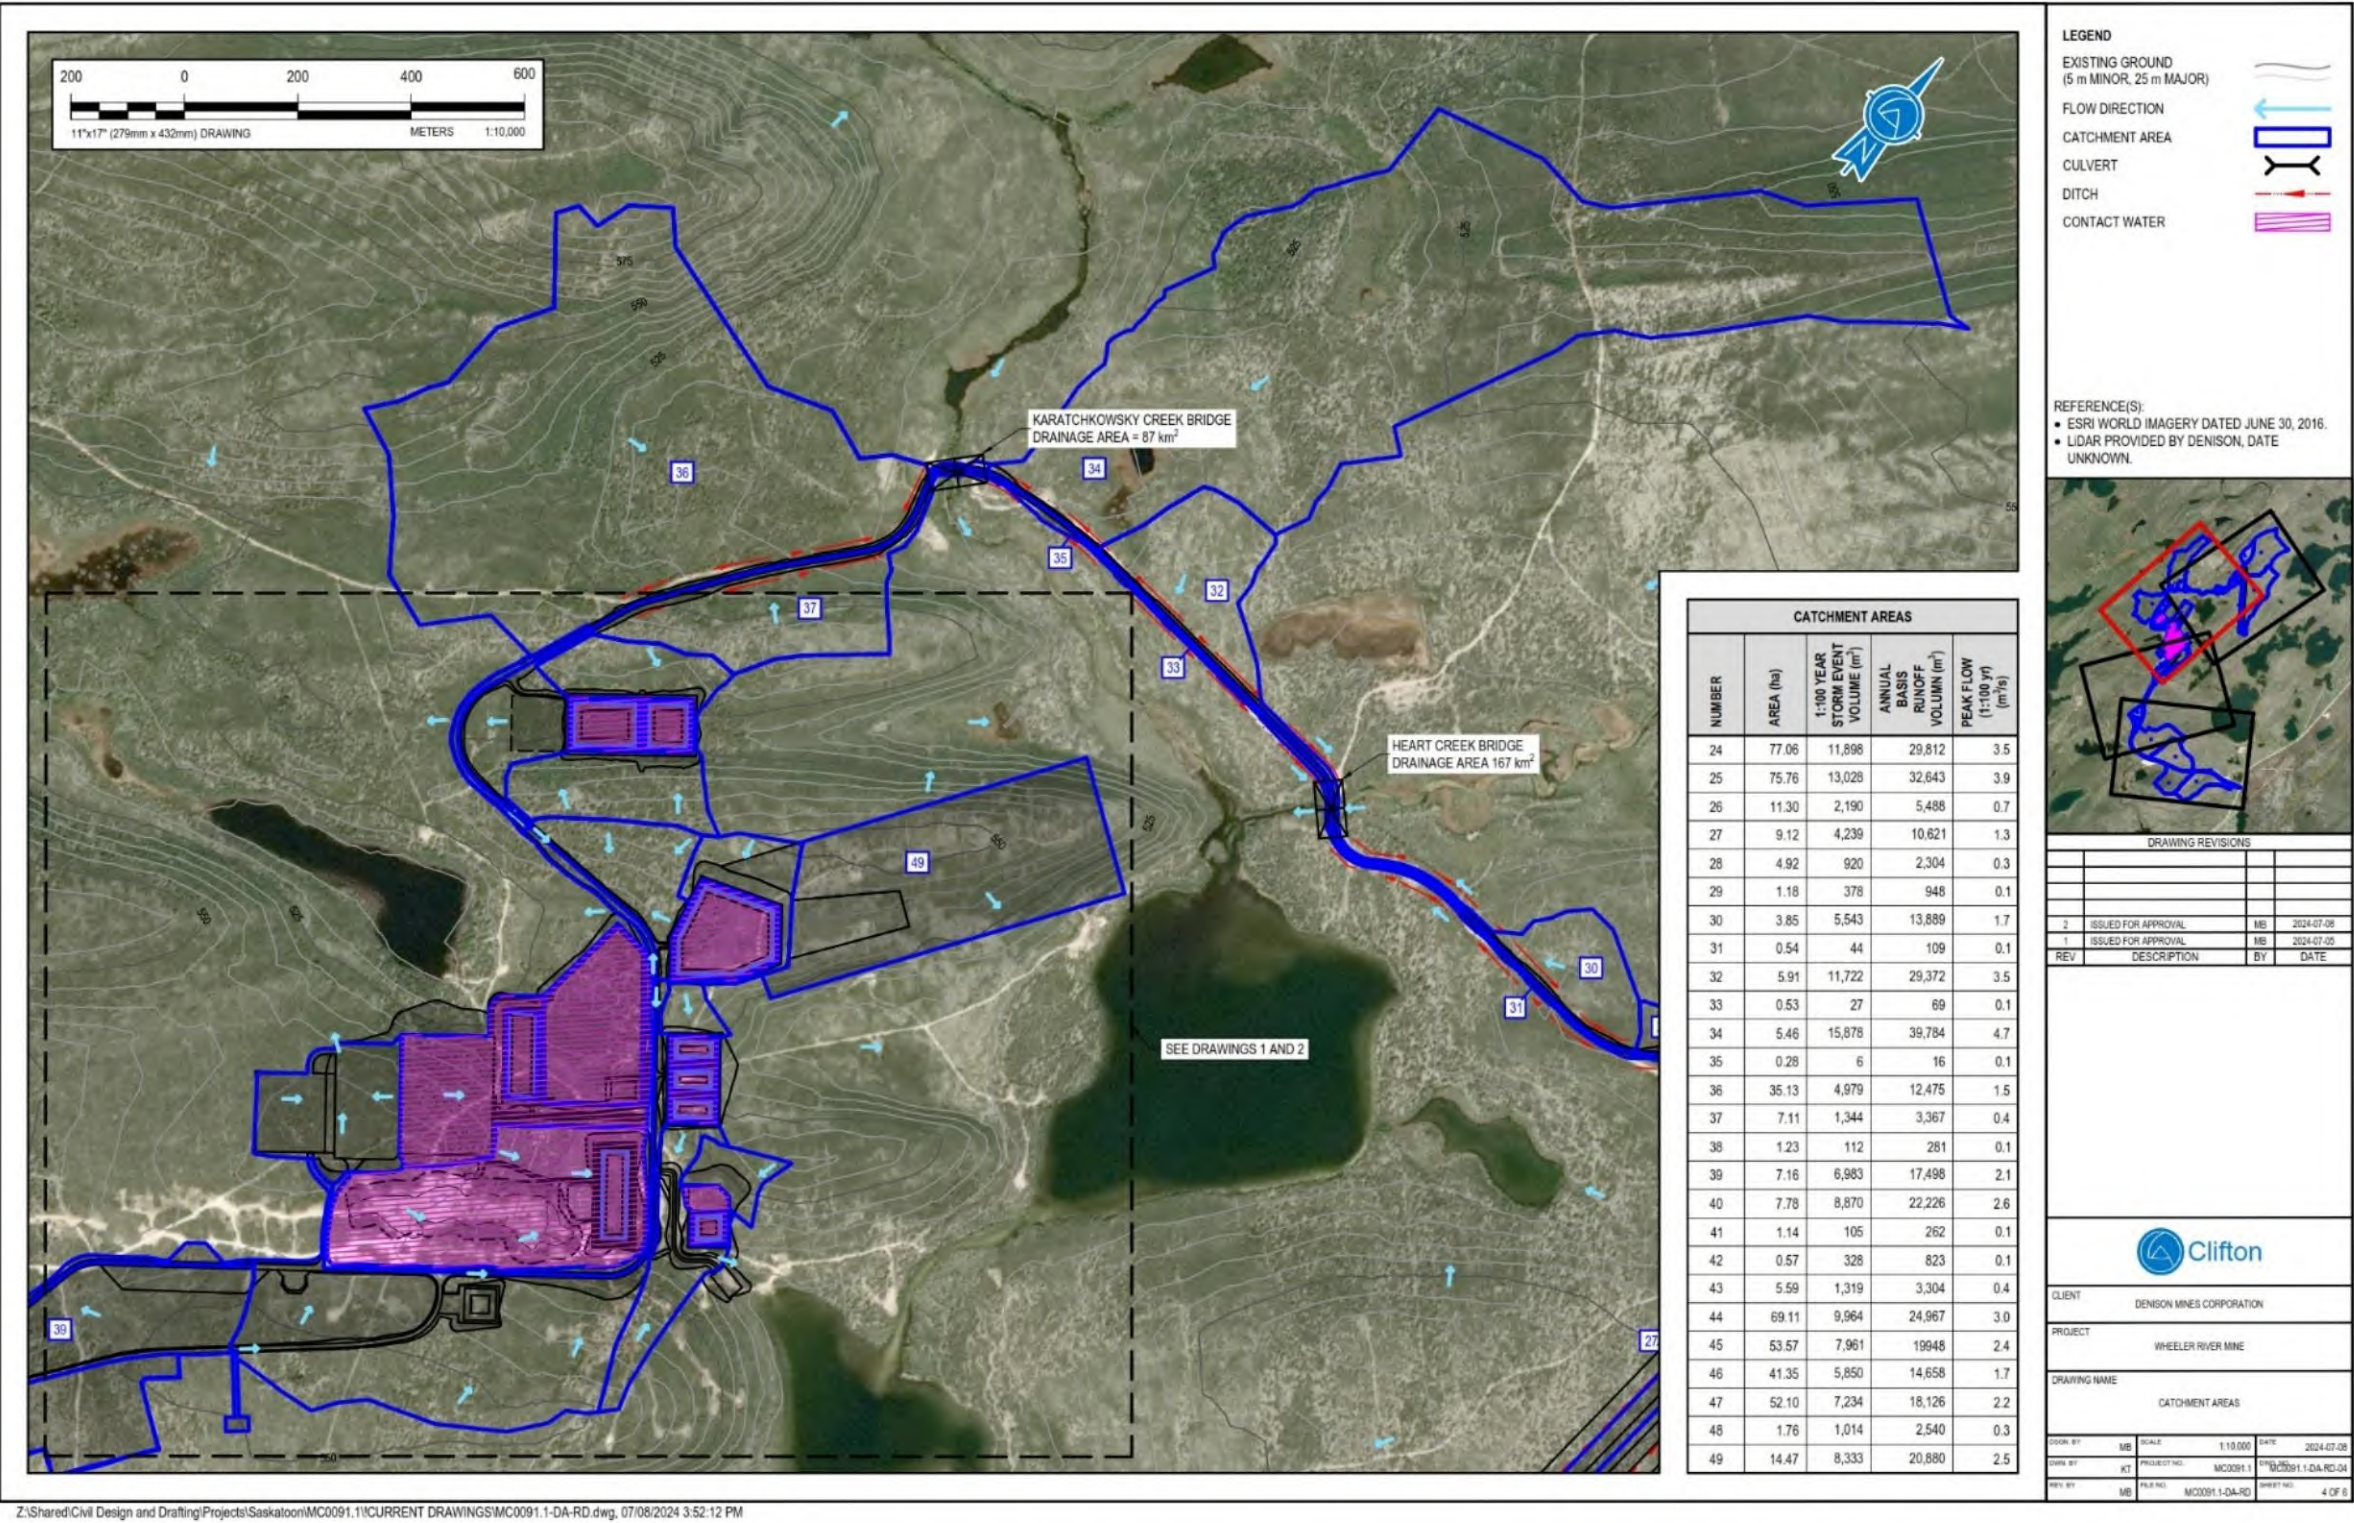

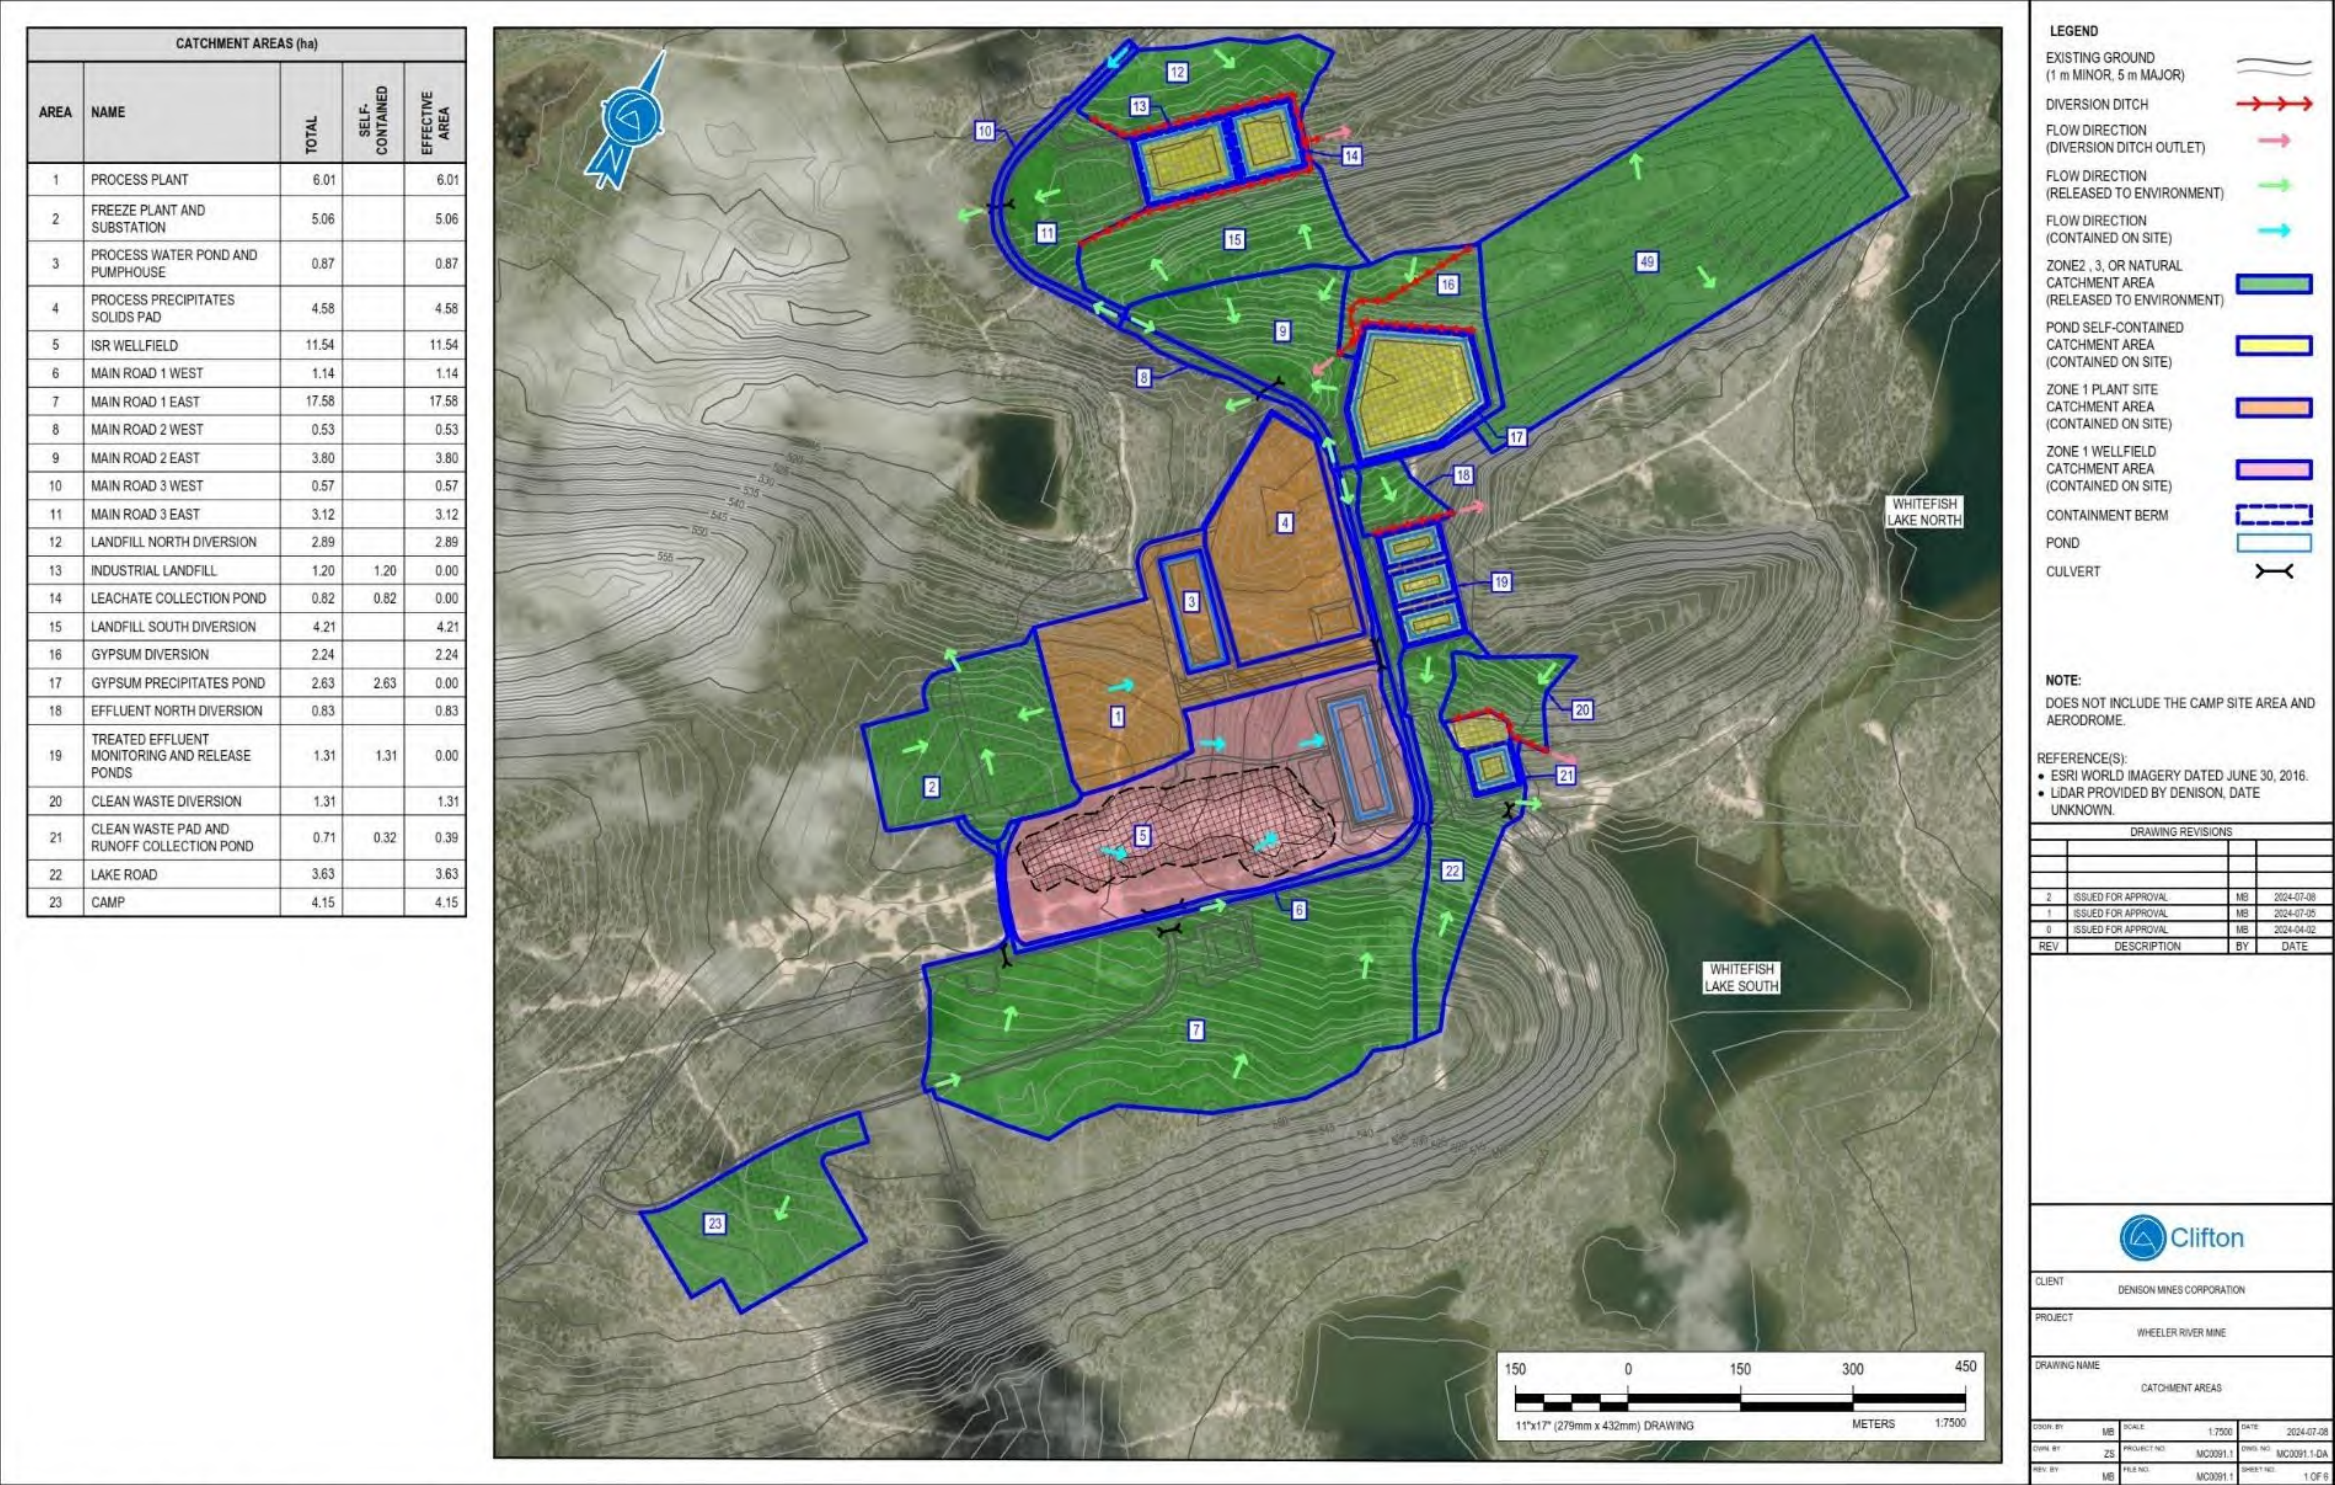

Figure 2: Site water management catchment areas – layout 2 of 5: Airstrip access road

Z:\Shared\Civil Design and Drafting\Projects\Saskatoon\MC0091.1\CURRENT DRAWINGS\MC0091.1-DA.dwg, 07/08/2024 3:48:17 PM

Figure 3: Site water management catchment areas – layout 3 of 5: main Project area

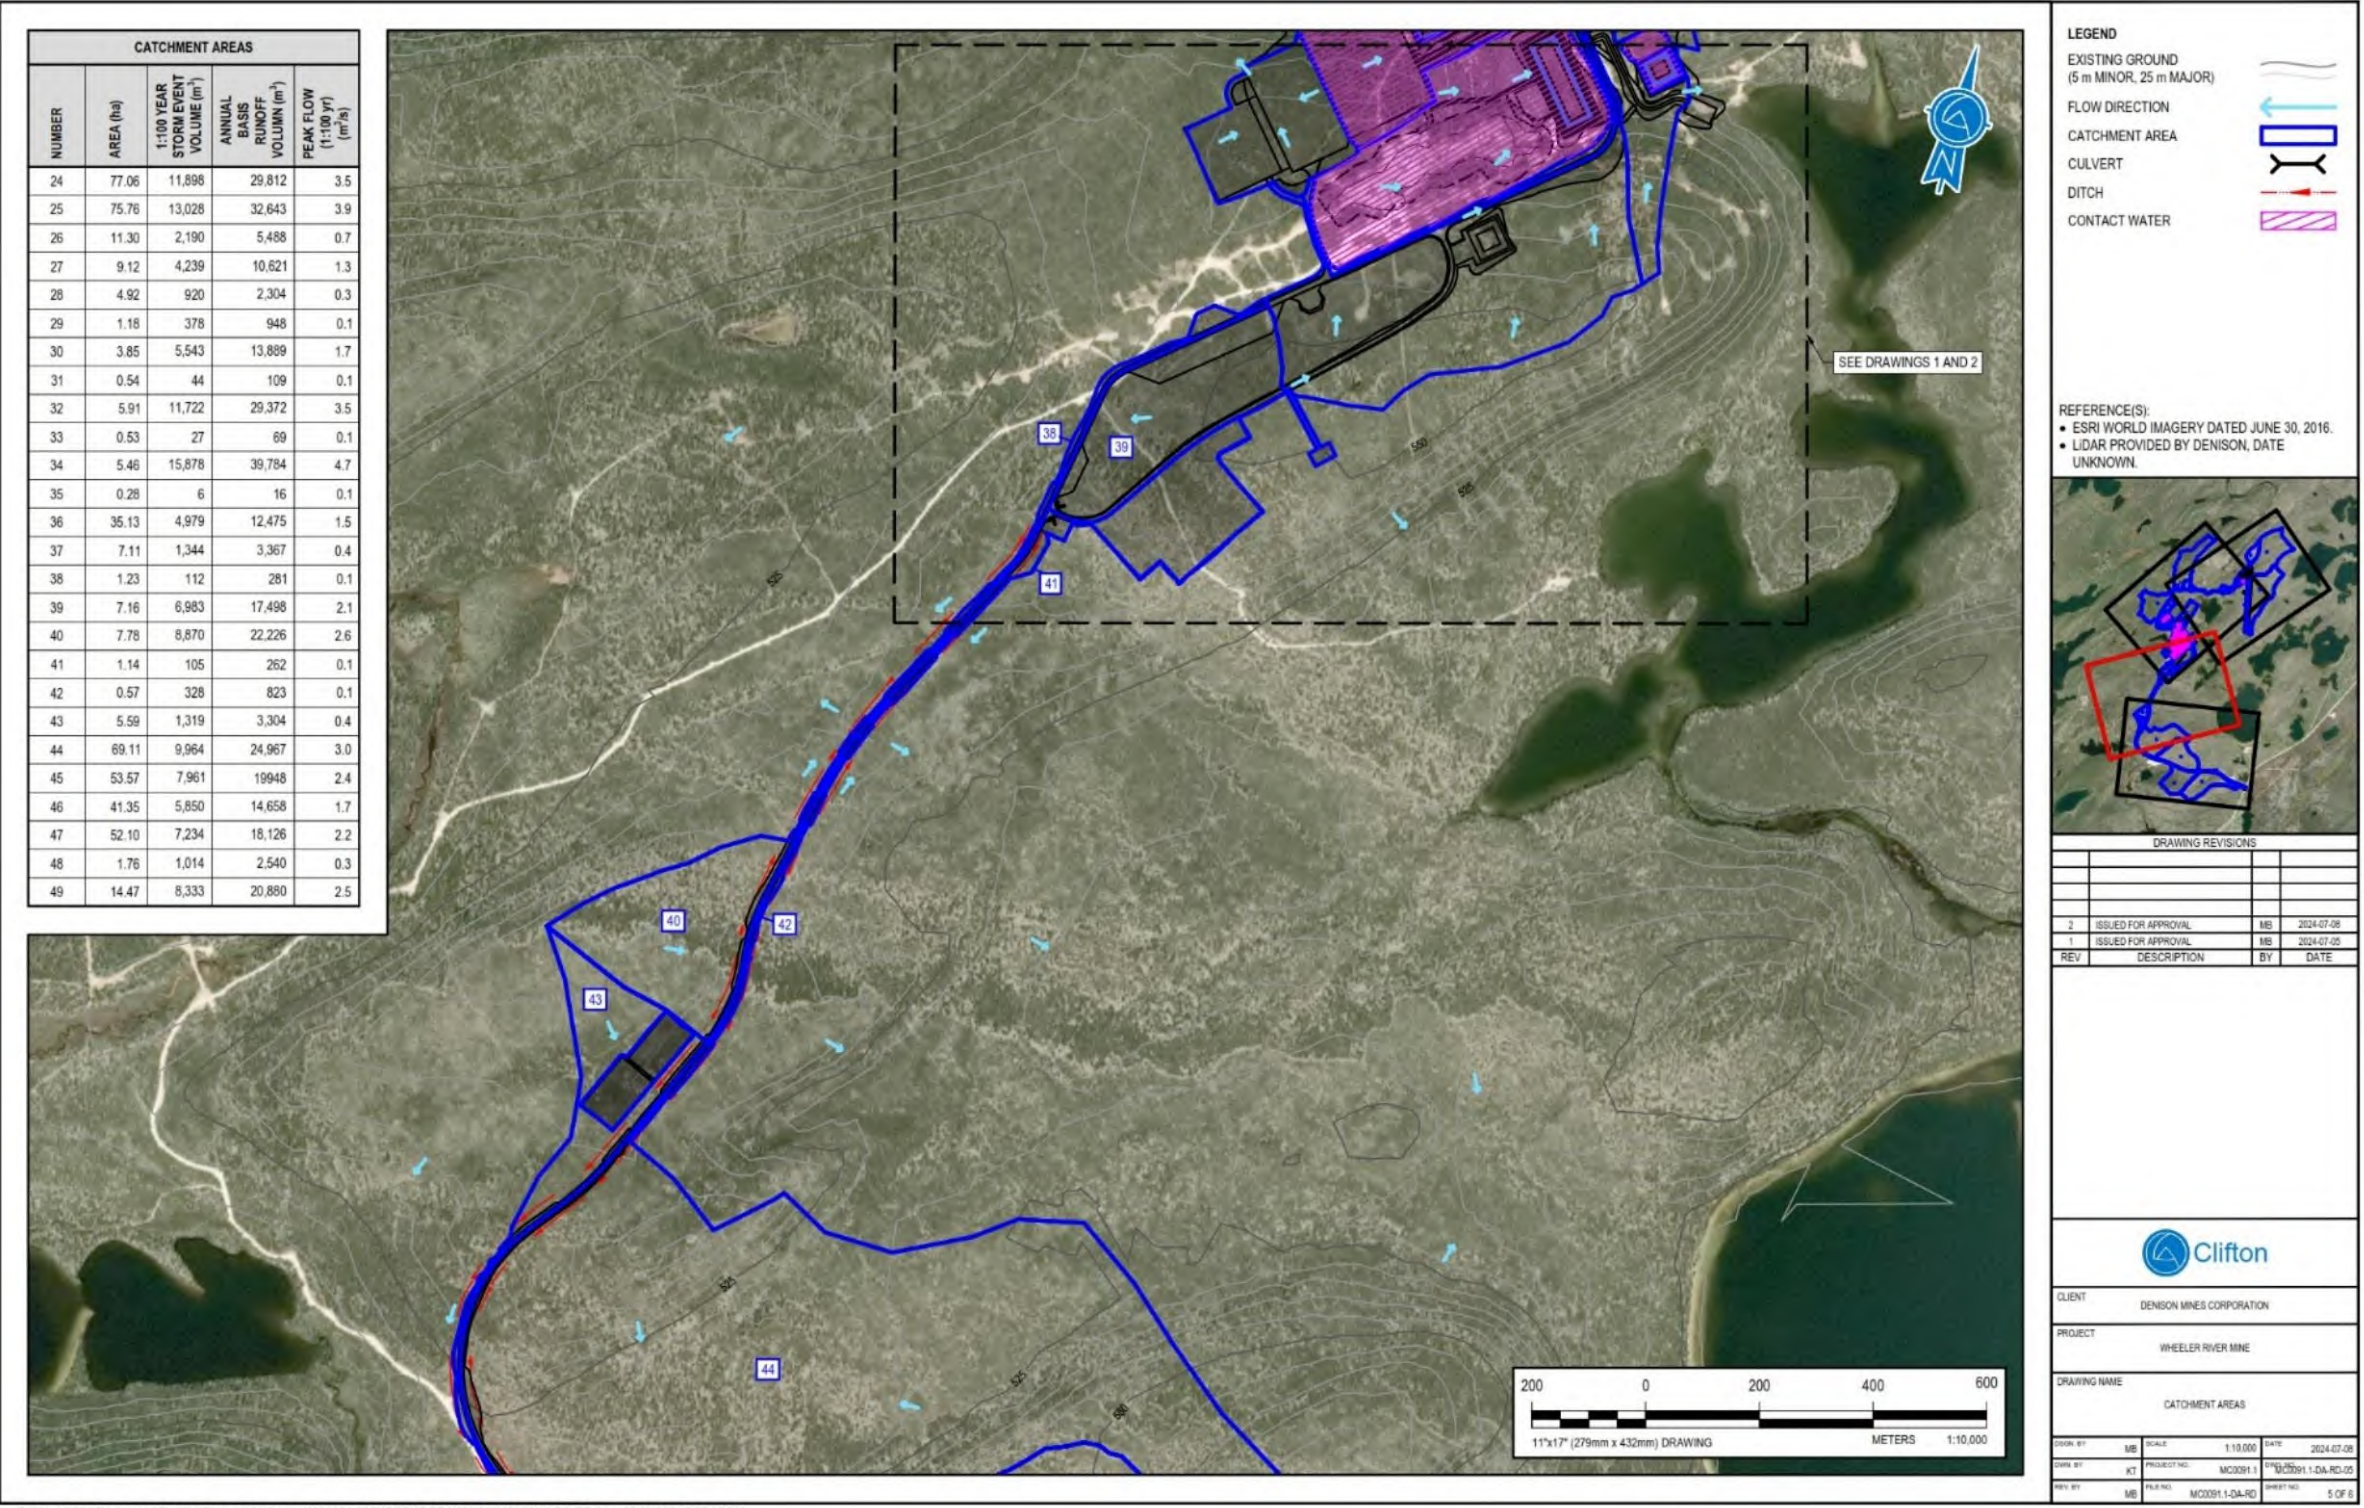

Figure 4: Site water management catchment areas – layout 4 of 5: Access road south of main Project area

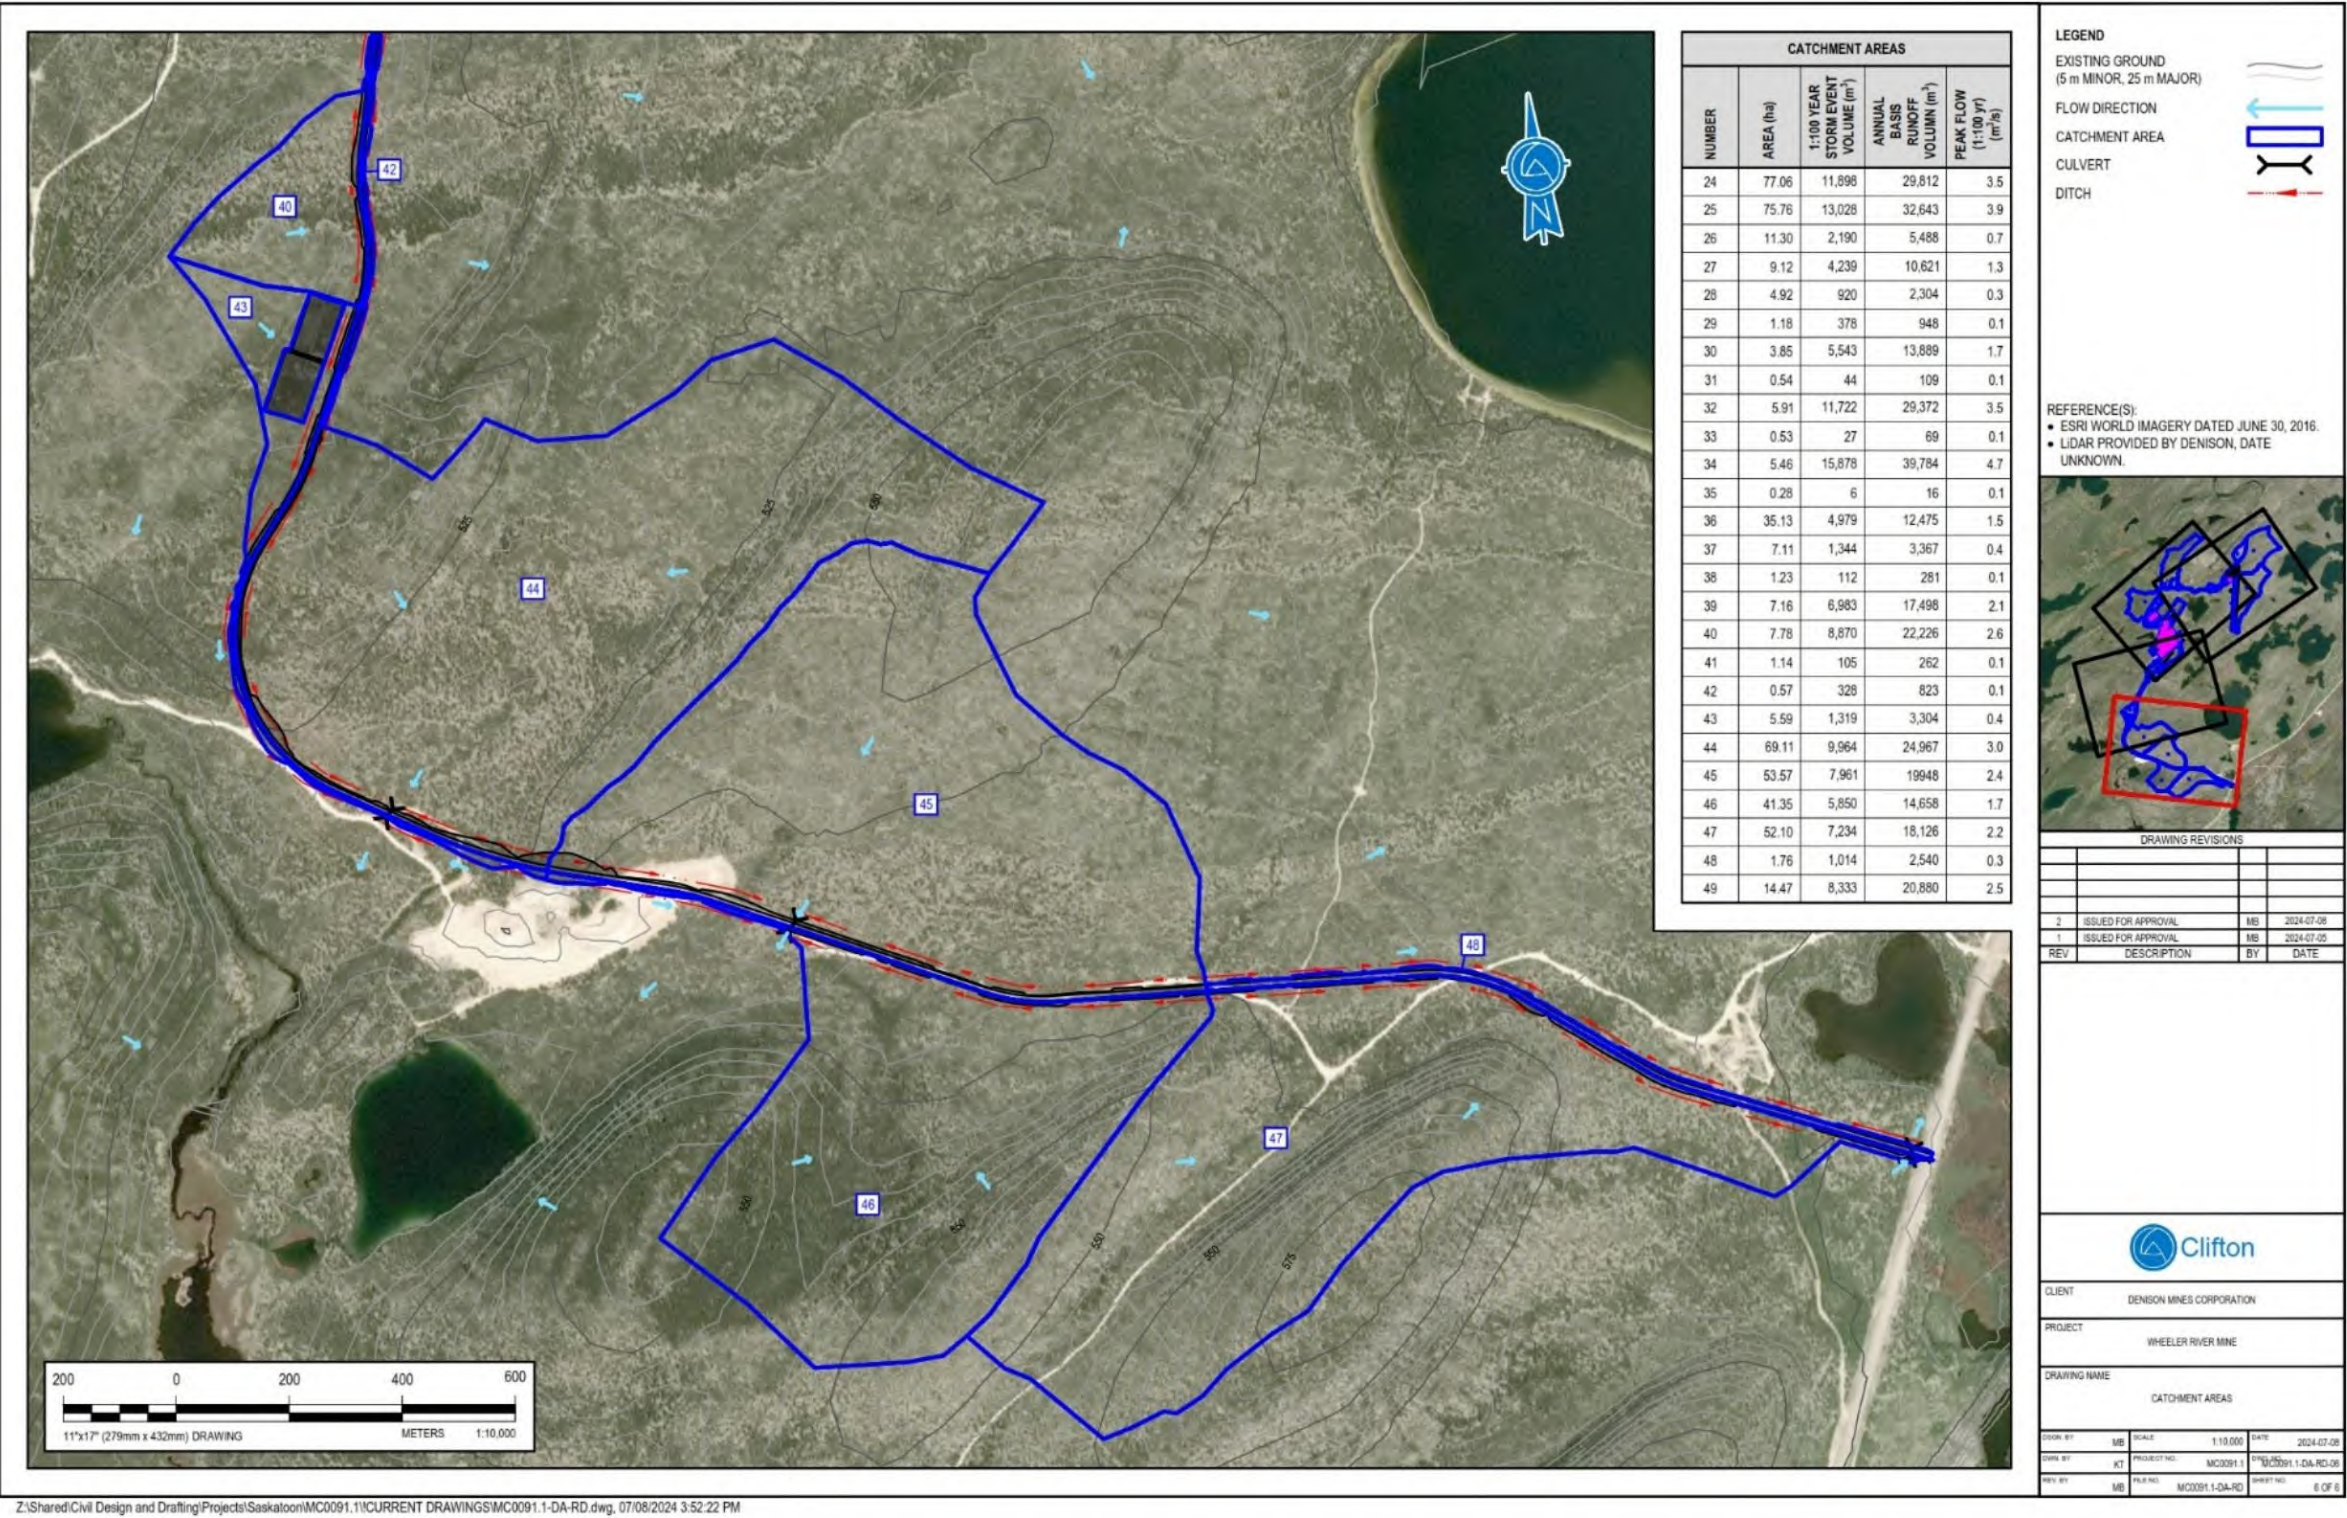

Figure 5: Site water management catchment areas – layout 5 of 5: Access road connection to Highway 914

## **Screening of Constituents of Potential Concern (COPCs) and Non-contact Water Source Areas**

The screening of constituents of potential concern (COPCs) in non-contact water is provided in Table 1 and is organized in terms of catchment characteristics / land use and Project components within or adjacent to the catchments. A screening was not completed here for contact water, as Denison has previously outlined the need to collect and treat this water (refer to Section 2.3.3 of the EIS).

A description of the Project's landscape, key Project components and activities, and management system plans are included here to facilitate the screening exercise.

### **Setting**

The Project is located within the Wheeler Upland Landscape Area of the Athabasca Plain Ecoregion within the Boreal Shield Ecozone of Saskatchewan. The area is characterized by Brunisolic soils which are typically sandy, well-drained soil. Standing water is not a common occurrence.

Ground surface topography regionally has been shaped by glacial and fluvial processes active for over tens of thousands of years. The terrain is characterized by northeast to southwest trending drumlins and eskers, with small variations in elevation (ranging 480 to 590 m above sea level) resulting in a gently sloping terrain. Most of the Project Area consists of upland forest ecosite. Refer to Figure 1-6 in the EIS for a summary of landscape features and current site conditions.

### **Airstrip**

The airstrip will be constructed and maintained using locally-sourced granular material. Denison will be using material from the borrow area (overburden material). Borrow pit area selection was based on geotechnical program completed in 2021 which did not identify any potential for ARD/ML. Further works are ongoing part of engineering activities and with confirmation of characterization through assays of representative samples. As such, the material used to construct and maintain the airstrip will not be a source of metals or ARD.

Design for airstrip will in general be such that runoff will be encouraged through appropriate grading to drain away and not pond on or near the airstrip. The condition of the airstrip will be inspected and maintained routinely. For example, should unexpected water pooling be observed at the airstrip during Operation, temporary water removal means such as vac trucks or sump pumps could be employed, and the areas would be re-graded to minimize water accumulation.

All fueling and de-icing activities will occur in specifically designed areas to collect any hydrocarbons and de-icing fluids. Collected waters will be characterized and brought to the Project site for treatment, shipped offsite to an approved facility or released to environment if water quality allows.

### **Roads**

Mainland access to the site will be from Highway 914. A 7-km section of road will be constructed from the highway to the Project site and a 5-km long road will also be constructed from the Project site to the airstrip; the total road length is 12 km. The road or trail to the airstrip is currently an

unmaintained road: the decommissioned Fox Lake Road. Additional site roads will include, for instance, a service loop to the camp.

Roads will be constructed of locally-source granular subbase and base. For road upgrades and maintenance, Denison will be using material from the borrow area (overburden material). Borrow pit area selection was based on geotechnical program completed in 2021 which did not identify any potential for ARD/ML. Further works are ongoing part of engineering activities and with confirmation of characterization through assays of representative samples. As such, the material used to construct, upgrade, and maintain roads will not be a source of metals or ARD. Design for roads will in general be such that runoff will be encouraged through appropriate grading to drain away and not pond on or near the road. The condition of site roads will be inspected and maintained routinely. For example, should unexpected water pooling be observed during Operation, temporary water removal means such as vac trucks or sump pumps could be employed, and the areas would be re-graded to minimize water accumulation.

In terms of material being transported on the site roads, the final product (yellowcake) will be transported in sealed drums from the processing plant south to the public highway network. With the selection of the in-situ recovery method the Project does not involve transporting large volumes of mine waste rock around the site.

#### Stream Crossings

Two water crossings (Kratchkowsky Creek and Hart Creek) will be installed along the road from the Project site to the airstrip. Both stream crossings occur along the section of the road which is an existing, unmaintained road (the decommissioning Fox Lake Road). The crossings will be designed, constructed, and maintained to avoid causing harm to fish and fish habitat and will be clear span bridges. Clear span bridges are designed to completely span a watercourse without interfering with the channel bed and banks.

#### Miscellaneous Project Components

In the SWMP, specific consideration is given to other areas of the Project including the diversion ditches at the main Project area, borrow area, camp, freeze plant and substation based on the delineation of catchments / land uses. Infrastructure in these areas will be constructed using locally-source material from the borrow area and are subject to Project-wide management system and best management practices. Any specifics of relevance to water quality are provided in Table 1.

#### Management System

We note that accident and malfunctions screening and assessment was completed in Section 14 of the EIS. The SWMP and screening of COPCs contained herein focuses on more routine events within the Project design basis, for example discrete leaks or spills of hydrocarbons from equipment. Events outside of the design basis were appropriately considered in Section 14 of the EIS. For instance, through the hazard identification process (see Appendix 14-A Section 3.0 and Appendix A), the release of fuel (diesel) was carried forward for more detailed analysis.

While details of Denison's management system programs and plans will be developed to support licensing, for context on the SWMP a description of key topics is provided here.

*Erosion and Sediment Control (ESC):*

Soil erosion is a natural process, but erosion is increased when land is disturbed. Erosion can result in sedimentation. The main concern is erosion caused by precipitation and run off. Erosion control is any measure undertaken to reduce the potential for erosion to occur (SK MHI 2012). Sediment control is any measure implemented to reduce the potential for sediment to be transported and/or deposited beyond the limits of the site (SK MHI 2012). Erosion control will be viewed as a first defense when protecting downstream aquatic habitats, while sediment control will be implemented as a contingency plan. Denison will focus on preventing soil erosion in order to reduce sedimentation and potential effects to the aquatic environment. In selecting the appropriate ESC treatment for areas of the Project, Denison will consider both temporary and permanent measures. Selection of ESC measures are dependent on site slopes, drainage patterns, existing vegetation and other site-specific conditions. Erosion control measures may include preventing or minimizing ground disturbance when working near water, maintaining/retaining as much vegetation as possible, erosion control blankets, and rip rap. Sediment control measures may include wattles and silt fencing.

*Spill Response Plan:*

Should unplanned events or conditions occur, it will be important for Denison to address and respond in an appropriate manner. Denison will identify and reduce the potential for accidents and emergency situations, and implement emergency response plans that will protect the health and safety of its workers, contractors, the public and the environment. Spill response plans would include procedures for worker and environment protection, details about personnel protection equipment, and procedures to evaluate exposures during a spill.

*Radiation Protection Program:*

The Radiation Protection Program has been designed, and will be implemented, such that Denison complies with, or exceeds, the level of radiation safety that is required by the applicable regulations and Denison's Environment, Health, Safety and Sustainability Policy. Areas within the Operation are designated according to potential radiological hazards and contamination control requirements. The movement and accumulation of all forms of radioactive contamination will be monitored via dosimetry and area monitoring. Contamination control measures will be in place to minimize the spread of radioactive materials into unintended locations.

*Waste Management Program:*

The Waste Management Program provides the framework that confirms Denison's licensed activities involving the processing, storage, and disposal of wastes are performed in a manner that complies with applicable regulatory and licence requirements and protects workers, the public, and the environment. The Waste Management Program includes identification of waste inventory and the characteristics of the waste (radiological and hazardous non-radiological). The program also includes waste segregation, waste packaging, and transfer requirements,

and the plan for storage or disposal of wastes. The Waste Management Program outlines the principles of reduction/reuse/recycle/and recovery (4 Rs) applied at the Project.

*Personnel and Contractor Training and Performance Management Program:*

A Personnel and Contractor Training and Performance Management Program would be developed to ensure all Project related personnel are fully equipped to effectively implement their work functions, in particular consideration of how job function may affect the environment, including worker and public health, within the context of the Environment Management System (EMS). Measurement of performance provides the means to Denison to foster a culture of continuous improvement.

Table 1: Screening of Constituents of Potential Concern (COPCs) in Water Catchments

Catchment Description	Catchment IDs	Constituent Group	Risk to Aquatic Environment	Management / Mitigation	Summary
Airstrip	24, 25, 27, 28	Metals (metal leaching)	Metal leaching can occur when certain minerals in rocks containing metals are exposed to air and water. If the material used to construct, and maintain the airstrip contains metals, then there is the potential for metals to leach into runoff, and report to the surrounding environment, where there is the potential for negative effects on the aquatic environment.	<ul style="list-style-type: none"><li>The borrow pit area selected for construction and maintenance of various Project components was based on geotechnical program completed in 2021 which did not identify any potential for ARD/ML. Further works are ongoing part of engineering activities and with confirmation of characterization through assays of representative samples.</li></ul>	At the airstrip, the infrastructure design in combination with management plans (e.g., geochemical characterization of borrow material, spill response plans, ESC) and best management practices result in a determination that runoff in this area is classified as <b>non-contact water</b> .
		Acid Rock Drainage	Acid rock drainage (ARD) is a process where sulfide minerals in rocks react with air and water to produce sulfuric acid, which then leaches metals from the rocks. If the material used to construct and maintain the airstrip results in ARD, the quality of runoff will be impacted and there is the potential for negative effects on the aquatic environment.	<ul style="list-style-type: none"><li>The borrow pit area selected for construction and maintenance of various Project components was based on geotechnical program completed in 2021 which did not identify any potential for ARD/ML. Further works are ongoing part of engineering activities and with confirmation of characterization through assays of representative samples.</li></ul>	
		Nutrients	None expected	n/a	
		Hydrocarbons	A release of hydrocarbons such as diesel, gasoline, or jet fuel to the environment poses a threat to aquatic organisms.	<ul style="list-style-type: none"><li>All fueling and de-icing activities will occur in specifically designed areas to collect any hydrocarbons and de-icing fluids.<ul style="list-style-type: none"><li>Collected waters will be characterized and brought to the project site for treatment, shipped offsite to an approved facility or released to environment if water quality allows.</li></ul></li><li>Personnel training.</li><li>Spill Response Plan will be in place throughout the life of the Project.</li><li>Appropriate spill response kits will be positioned adjacent to areas where hazardous materials such as hydrocarbons are stored in accordance with the Spill Response Plan.</li><li>Fuel storage and distribution infrastructure will be constructed in accordance with applicable legislation requirements.</li><li>Fuels will be stored in approved, above-ground, double-walled storage tank(s) equipped with secondary containment in accordance with provincial regulations and standards.</li></ul>	
		Suspended solids	Erosion and the resulting sedimentation can have a number of impacts on the aquatic environment (WSA 2024): sediments can cover the small spaces between productive rock or gravel habitats; increased levels of sediment in the water can displace aquatic organisms from prime habitat into less suitable areas; cloudy or turbid waters affect visual predators' ability to forage; high levels of suspended sediment in the water can affect fish and other aquatic organisms' ability to breath; and turbid water absorbs more sunlight energy increasing the water temperature, which in turn, does not allow the water to hold as much oxygen.	<ul style="list-style-type: none"><li>Restrict all construction activities to the approved construction footprint.</li><li>Leave vegetated buffer zones around watercourses and other sensitive features when developing/operating supporting infrastructure.</li><li>Implement best management practices associated with erosion and sediment control (ESC).</li></ul>	
		Other Chemicals	A release of glycol and other de-icing fluids to the environment poses a threat to aquatic organisms.	<ul style="list-style-type: none"><li>All fueling and de-icing activities will occur in specifically designed areas to collect any hydrocarbons and de-icing fluids.<ul style="list-style-type: none"><li>Collected waters will be characterized and brought to the project site for treatment, shipped offsite to an approved facility or released to environment if water quality allows.</li></ul></li><li>Personnel training</li><li>Spill and Emergency Response Plan will be in place throughout the life of the Project</li></ul>	

Catchment Description	Catchment IDs	Constituent Group	Risk to Aquatic Environment	Management / Mitigation	Summary
Roads	26, 29, 30, 31, 32, 33, 34, 35, 36, 37, 11, 10, 9, 8, 7, 6, 22, 38, 41, 42, 40, 43, 44, 45, 46, 47, 48	Metals (metal leaching)	Metal leaching can occur when certain minerals in rocks containing metals are exposed to air and water. If the material used to upgrade, construct, and maintain roads contains metals, then there is the potential for metals to leach into runoff, and report to the surrounding environment, where there is the potential for negative effects on the aquatic environment.	<ul style="list-style-type: none"> <li>The borrow pit area selected for construction and maintenance of various Project components was based on geotechnical program completed in 2021 which did not identify any potential for ARD/ML. Further works are ongoing part of engineering activities and with confirmation of characterization through assays of representative samples.</li> </ul>	On and adjacent to the Project's roads, ESC will be the focus. Best management practices are important for ESC throughout the life of the Project, and of particular importance during construction. Routine inspections and monitoring will be completed to document the effectiveness of the erosion and sediment control measures, and any required maintenance or replacement of ESC structures would be completed as required. Through the implementation of road design and best management practices, the runoff in these areas is classified as <b>non-contact water</b> .
		Acid Rock Drainage	Acid rock drainage (ARD) is a process where sulfide minerals in rocks react with air and water to produce sulfuric acid, which then leaches metals from the rocks. If the material used to upgrade, construct, and maintain roads results in ARD, the quality of runoff will be impacted and there is the potential for negative effects on the aquatic environment.	<ul style="list-style-type: none"> <li>The borrow pit area selected for construction and maintenance of various Project components was based on geotechnical program completed in 2021 which did not identify any potential for ARD/ML. 			sediments can cover the small spaces between productive rock or gravel habitats; increased levels of sediment in the water can displace aquatic organisms from prime habitat into less suitable areas; cloudy or turbid waters affect visual predators’ ability to forage; high levels of suspended sediment in the water can affect fish and other aquatic organisms’ ability to breath; and turbid water absorbs more sunlight energy increasing the water temperature, which in turn, does not allow the water to hold as much oxygen.	<ul style="list-style-type: none"><li>• Leave vegetated buffer zones around watercourses and other sensitive features when developing/operating supporting infrastructure.</li><li>• Implement best management practices associated with ESC, with a particular focus on Project components and activities located within 50 to100 m of a waterbody where required (i.e., at locations where there is no vegetated buffer adjacent to the waterbodies). Refer to Figure 6 below.</li><li>• Traffic control measures.</li></ul>	
		Other Chemicals	Radionuclides are a potential contaminant associated with the Project activities.	<ul style="list-style-type: none"><li>• A wash bay will be available to clean items, equipment, and vehicles that may have been in contact with potential contaminants.</li><li>• Administrative controls will be in place to control radioactive materials and radiological clearance: All objects (equipment, vehicles, etc.) from potentially contaminated work areas that need to be transported off-site as non-radioactive materials must be thoroughly cleaned and checked for contamination prior to release.</li></ul>	

Notes:

- [As described earlier in the SWMP, the screening completed in Table 1 is based on routine or normal operating conditions. Accidents and malfunction type risks were assessed separately in Section 14 of the EIS and mitigations associated with accident and malfunction events have been incorporated and described in that analysis in the EIS.](#)
- [As described in Section 2 of the EIS, a wash bay is proposed as part of the Wheeler River Project infrastructure. The wash bay will be available to clean items, equipment, and vehicles that may have been in contact with potential contaminants. For the purpose of the site water management strategy, water derived from the wash bay is by definition “contact water” \(i.e., fits the definition of contact water above\) and is not considered in the screening of non-contact water sources in Table 1 for that reason. The wash bay area will have an impermeable floor and a lined water collection sump. Rinse water from the wash bay sump will be routed to the wellfield runoff pond or directly to the process water pond. It will be subsequently conveyed as a component of the influent stream to the IWWTP and treated. Treated effluent would be discharged to Whitefish Lake once deemed suitable for release.](#)

n/a = not applicable  
ARD = acid rock drainage  
ARD/ML = acid rock drainage/metal leaching  
ESC = erosion and sediment control

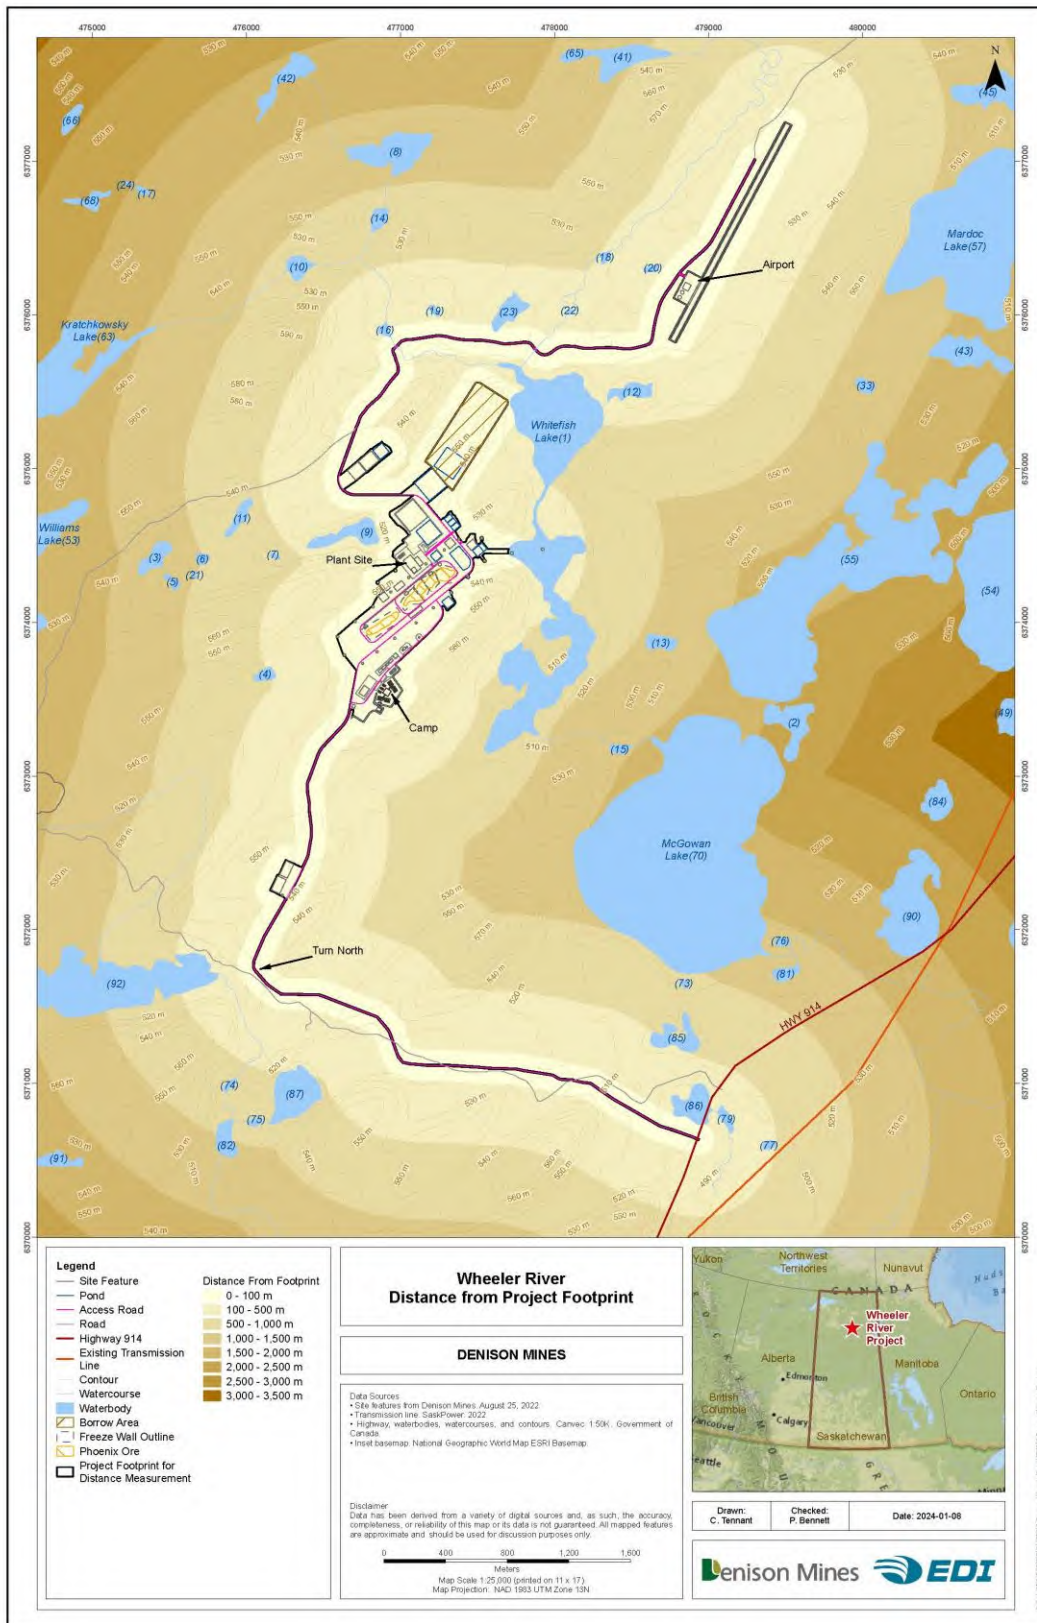

Figure 6: Distance from Project Footprint to Waterbodies

### **Delineation of Contact and Non-contact Water Source Areas on the Site**

Based on information in the EIS and additional clarifications contained here, contact water is expected at the wellfield, processing plant terrace, the refueling and de-icing area at the airstrip, and leachate collection areas at the landfills. Contact water will be collected in various ponds and eventually routed through the IWWTP for treatment prior to release to Whitefish Lake.

Based on the screening completed in Table 1 using Figures 1 through 5, the non-contact water areas are locations where clean water can be diverted away from Project infrastructure. Through design and implementation of best management practices, the catchment areas described above were determined to contain non-contact water. The runoff from these areas will not be collected and treated.

### **Estimation of Typical and Event Volumes from Contact and Non-contact Water Source Areas**

Refer to Figures 1 to 5 for information on the size of individual catchment areas, the volume of water expected on an annual basis and with a 1:100 year storm event, and the peak flow associated with a 1:100 year storm event.

At the wellfield and processing plant terrace the volume of water expected during a 24-hour PMP of 493 mm is approximately 37,240 m<sup>3</sup>. The wellfield runoff pond has been sized appropriately (38,200 m<sup>3</sup> with 1 m of freeboard) to contain this volume of water.

### **Water Management Structures**

The Stormwater Management Plan associated with non-contact water uses shallow ditching to dissipate the energy of runoff, to promote settling of suspended solids and allow the runoff to report to ground via natural grades that flow away from the infrastructure and into the natural drainage systems. The approximate location of proposed ditches are shown in Figures 1 through 5.

Diversion ditching of non-contact water away from disturbed and developed areas. Diversion ditching is designed to divert as much clean non-contact surface water as reasonably possible away from any disturbed areas, facilities or works where that water may become contaminated, including but not limited to the wellfield, processing plant area, and waste management areas.

Road ditch inverts adjacent to roadways and graveled pads should be lower than the subgrade at the shoulder and ditches will be designed based on specific criteria for slopes (sideslopes, longitudinal slopes), bottom widths, a range of velocities, and a minimum freeboard (refer to Table 2). Ditch design criteria will be refined as the Project advances.

**Table 2: Preliminary Ditch Design Criteria**

<b>Ditch Element</b>	<b>Design Criteria</b>
Conveyance Capacity Requirements	a) 1:100 yr., 24 hr. event for diversion ditches and non-contact water collection ditches b) 24 hr. PMP event critical ditches where upset would be considered a release to environment (i.e., contact water)
Manning's Roughness Coefficient	n = 0.030

Preferred Ditch Sideslopes	3H:1V
Maximum Ditch Sideslopes	2H:1V (with depth restrictions and possible sideslope erosion protection determined on case-by-case basis)
Minimum Longitudinal Slope	0.20%
Maximum Longitudinal Slope	2.00% (steeper ditching require engineered channels)
Minimum Velocity	0.3 m/s
Maximum Velocity	0.73 m/s (subject to variance dependent on ditch bottom materials)
Preferred Ditch Bottom Width	1200 mm
Minimum Ditch Bottom Width	600 mm
Minimum Ditch Freeboard	200 mm (below road finished grade shoulder to 1:100 yr 24 hour rain event)

Armouring such as rip-rap or re-vegetation will be required for erosion prone areas on all road slopes and ditching. Because of the sandy soil conditions of this site, erosion control will be an important consideration in design for all ditching and grading features due to high erodibility of the soils. Ditches require armouring for a minimum horizontal distance of 3 metres around culvert inlets, or as determined by hydraulic modeling. The general rule for protecting the downstream of a culvert is that armouring of three (3) pipe diameters should be used for each 1 m/s of velocity reduction required.

### **Monitoring and Compliance**

Site water management plan monitoring will be conducted, primarily to confirm the best management practices related to ESC are functioning as intended. Routine inspections and management would be completed to document the effectiveness of the ESC measures, and any maintenance or replacement of ESC structures would be completed as required.

The EIS Section 2.9 Management System outlines the framework to support EIS review. The Project's detailed management programs and plans will be developed to support licensing and permitting. Of relevance to this Plan, the following is noted:

- The Spill Response Plan will outline how Denison will appropriately respond to and clean-up any unexpected spills. Spill reporting to Saskatchewan Ministry of Environment, ECCC, and the public will be required depending on the nature of the spill.
- The Effluent and Emissions Monitoring Plan includes sampling plans for stormwater during construction.
- The Construction Management Plan incorporates environmental considerations. Construction activities with higher potential risk of ESC problems include excavation and borrow areas, clearing and grubbing, ditch construction, and earthwork near/across streams and lakes
- Environment inspections will be conducted at various project areas on a frequency specified in future licences and permits. This may include for instance daily and weekly

inspections of fuel storage tanks, ponds, pads, lines, etc. to ensure compliance with operational conditions, best management practices and other requirements. Inspection (and sampling) plans for non-contact water mitigation measures such as silt fencing will coincide with precipitation events and spring runoff.

Various aspects of Project monitoring will not only be included in Denison's management system documentation but also included as conditions in permits, authorizations, and licences. The Provincial laws governing development in, or near, water are set out in *The Environmental Management and Protection Act, 2010* and *The Environmental Management and Protection (General) Regulations*. Denison will apply to the Saskatchewan Water Security Agency for an Aquatic Habitat Protection Work for any work near water and will adhere to the conditions of the permit. Fish and fish habitat are protected by provisions of the *Fisheries Act*. The Project will be constructed, operated and decommissioned in a manner compliant with Section 36 of the *Fisheries Act*. The Ministry of Environment enforces provincial legislation in collaboration with federal regulators.

### **Education and Training**

Denison will provide education and training to staff and contractors about the importance of non-contact water management and best practices associated with erosion and sediment control. This helps ensure that everyone involved in the safe Construction, Operation and Decommissioning of the Project understands their role in protecting the aquatic environment.

### **In Closing**

Denison views the EIS as an important planning tool that will be used to support future activities and represents one stage in the rigorous overall approvals process for a uranium mining facility in Canada. Denison is completing a sequential EA and licensing process for the Project. In the EIS, a framework for the EMS is provided along with a clear commitment for Denison to include Project design and water management-related mitigation measures into the EMS documents as they are developed / as the Project proceeds through the licensing and permitting phases. We trust that the FIRT has been provided with the appropriate level of detail on the water management topic for drawing conclusions on the EA process, and the summary contained in this SWMP will facilitate ECCC's review.

## Part 2 – Response to Specific Questions Raised in IRs 12, 12-R1A and 12-R1B

The table below highlights questions raised in IRs 12, 12-R1A and 12-R1B that weren't necessary fully described by the updated site water management plan (see Part 1).

Question from the IR	Denison Response
From FIRT's Information Request Rationale (2023-12-05): CNSC requests that Denison use a PMP value that is estimated using historical rainfall data that includes the most up to date meteorological data or provide justification on the validity of the current PMP.	Denison understands that validation of the current PMP will be assessed as part of CNSC licensing.
From Denison submission of responses to IRs (2023-08-18): Details related to culvert design and conveyance capacity are being developed as part of ongoing engineering activities. Culverts will be a designed with a sufficient size and length to convey water around the site during a PMP event.	Project design is bound by the EIS. Culverts within contact water areas are being designed to convey water associated with a PMP event.
The Proponent should include updated information on water treatment, flows, capacity and effluent discharge during normal operations, and a 24-hr Probable Maximum Precipitation (PMP) Event.	Non-contact water is not collected and routed through the industrial wastewater treatment plant (IWWTP). The wellfield runoff pond has been designed to accommodate the PMP. Influent to the IWWTP would be metered into the plant, per the treatment design rates and there would be no changes in effluent release rates beyond the assessed rates and plant design criteria.

IR- 101

- Department: ECCC
- Project Effects Link: Fish and fish habitat
- Reference to EIS, appendices, or supportant documentation: Section 8.1.1.3, Section 8.2.1.3 Aquati Environment

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, June 28, 2024)	IR (ROUND 4, Sept. 16, 2024)	Denison Response (ROUND 4, Oct. 18, 2024)
IR-101	-	<p><b>Context:</b> In Section 8.1.1.3 Spatial and Temporal Boundaries the Project Area, Local Study Area (LSA) and Regional Study Area (RSA) are established as they pertain to surface water quantity. The same is done in Section 8.2.1.3 for surface water quality. In Section 8.1.1.3 Figure 8.1-4, the locations of the Project Area, LSA, RSA and surface water features and monitoring stations are provided.</p> <p>However, the locations of wetlands located near the Project area and within the LSA and RSA have not been provided. The location of wetlands within or near the Project footprint, as well as the other wetlands existing within the LSA can be confirmed from Part II_S9 Terrestrial Environment, Section 9.2.3.3 Figure 9.2.-8, including the wetland classifications. There appears to be at least one shallow open water wetland and several bogs located within the Project Area. There is no consideration of wetlands or potential effects to wetland hydrology, surface water or sediment quality throughout the aquatic environment assessments. There is no baseline information regarding wetlands and their status as fish habitat and ecological function, or assessment of potential effects to flow rates, water levels, water quality, sediment quality, or biota.</p> <p><b>Rationale:</b> There is currently not enough information provided for ECCC to provide advice on the potential risks of the proposed Project to wetland hydrology, surface water and sediment quality within the LSA. This pathway of effects is important to assess in terms of potential effects to wetland habitat availability and quality due to changes in flow rates, water levels, water quality, sediment transport, sediment quality and potential effects to terrestrial and aquatic receptors. It is necessary to evaluate if changes in groundwater and surface water runoff flows and routing will affect water levels and habitat availability</p>	<p>1. Provide baseline information regarding wetland characterization within the Project Area and LSA, including: locations, wetland type, size, water surface elevation, depth, water flow pathways, and the presence of wildlife receptors including presence of fish/fish habitat within the Aquatic Environment section of the draft EIS. If this information is available in annexes or baseline studies, summarize it within the main body of the Aquatic Environment section of the draft EIS with references to respective documents for review.</p> <p>2. Provide baseline information on wetland surface water and sediment quality characterization for wetlands within the Project footprint.</p> <p>3. Provide an assessment of potential effects to wetlands within the LSA and potential effects to ecological receptors during all phases of the proposed Project.</p> <p>4. Provide further information on mitigation measures and monitoring that would be applied for the protection of wetlands.</p>	<p>Responses are numbered as listed in the IR. Figures associated with this IR are provided in Attachment IR-101.</p> <p>1) Below indicates the information that is presented in the draft EIS regarding wetland characteristics. This information was housed within the terrestrial environment component and potential impacts to wetlands as a valued component is further assessed under Section 9.2 of the draft EIS, and specifically Section 9.2.6.4. The following list indicates what information was provided in the draft EIS specific to information request #1. As such, repackaging the available information in Section 8 would be redundant and therefore in Denison's view unnecessary.</p> <p>a. <i>Locations of Wetlands</i> <b>Section 9, Figure 9.2-8</b> on page 9-83 of the draft EIS presents a map of the RSA and LSA detailing the locations of various wetland features including bogs and fens.</p> <p>b. <i>Wetland Types</i> <b>Section 9, Figure 9.2-8</b> on page 9-83, and <b>Table 9.2-8</b> on pages 9-91 to 9-92 of the draft EIS provides the geographical distribution and listing of the following wetland types within the LSA:</p> <p>i.BS17 – Black spruce treed bog ii.BS18 – Labrador tea shrubby bog iii.BS19 – Graminoid bog iv.BS19/24 – Graminoid bog/Graminoid fen v.BS20 – Open bog vi.BS21 – Tamarack treed fen vii.BS23 – Willow shrubby rich fen viii.BS24 – Graminoid fen ix.BS25 – Open fen x.BS27 – Sedge rocky shore (shallow open water)</p> <p>c. <i>Wetland Size</i> <b>Section 9, Table 9.2-8</b> on pages 9-91 to 9-92 of the draft EIS lists the following wetland types and the cumulative area they encompass within the LSA:</p> <p>i.BS17 – 18.2 ha ii.BS18 – 23.3 ha iii.BS19 – 2.8 ha iv.BS19/24 – 0.8 ha v.BS20 – 0.6 ha vi.BS21 – 1.9 ha vii.BS23 – 0.6 ha viii.BS25 – 0.4 ha ix.BS27 – 4.2 ha</p> <p>d. <i>Wetland Water Surface Elevation</i> Surface elevations for the wetland have been assessed and the information is summarized below and in the Attachment IR-101 <b>Figure 1 Elevations of wetland features in the LSA.</b></p> <ul style="list-style-type: none"><li>• Wetlands 1.5 km west of the SSA range from 526-524 masl</li><li>• Waterbodies and their surrounding wetlands directly to the east of the SSA are at an elevation of between 506 and 500 masl</li><li>• Waterbodies and surrounding wetlands 2 km east</li></ul>	<p>This response has not been accepted for the following reasons:</p> <p>1. The response (#1(d)) by the proponent states that “Surface elevations for the wetland have been assessed and the information is summarized below and in the Attachment IR-101 Figure 1 Elevations of wetland features in the LSA” but it is not indicated that this information will be placed in the EIS. CNSC staff requests proponent to include the information provided in response #1(d) and Attachment IR-101 Figure 1 (Elevations of Wetland Features in the LSA) and Attachment IR-101 Figure 2: (Denison Wheeler River Project SSA and Wetland Feature Distribution) in the EIS.</p> <p>2. The Proponent stated in response #2 (a) and (b) that “surface water quality and sediment quality in wetlands were not specifically sampled in the wetland complexes adjacent to the Project footprint during the original baseline assessment.” CNSC staff requests the proponent to provide justification why they have relied on measurements upstream and downstream of the wetlands over direct measurements in the wetland areas. It is recommended to conduct direct measurements in the wetland areas.</p> <p>3. The information provided did not satisfy the IR. Additional information regarding the potential impacts to wetlands due to changes in surface water quality and sediment quality should be included within Section 8.3 of the main EIS. This is needed to fully understand the scope of potential effects to the aquatic environment.</p> <p>a. Update Section 8.3 to include additional information on predicted water and sediment quality impacts to wetlands from the Proponent’s response to directly consider wetlands as fish and fish habitat for the purpose of assessing water quality impacts.</p> <p>b. Update Section 8.3 to provide an assessment of potential effects to wetlands from water and sediment quality changes within the LSA.</p> <p>4. It is stated in response #4 that “[...] Updated baseline information on wetland depths and water-levels may be useful in providing a frame of comparative reference to potential changes during the operation, decommissioning and post-decommissioning phases of the project” and CNSC staff agrees with the proponent and recommend collection of monitoring</p>	<p>1. This information has been incorporated into the EIS as Appendix 8-F.</p> <p>2. Denison is committed to conducting surface water quality and sediment quality in wetlands within the LSA and specifically in wetlands directly adjacent to the Operation prior to construction commencing for the purposes of collecting baseline to further assess the effectiveness of mitigation measures.</p> <p>3(a). Section 8.3 has been updated and specifically sections 8.3.1, 8.3.1.2, 8.3.3, 8.3.4.1, 8.3.4.2 (8.3.4.2.2 and 8.3.4.2.3, 8.3.4.2.5), 8.3.5, 8.3.7, 8.3.9 to include consideration of wetlands as aquatic habitat features within the context of their potential to provide fish and fish habitat. Sections 9.2.4.2.1, 9.2.6.2.1, 9.2.6.4.1, 9.2.7.3, and 9.2.9 have been updated to be aligned with Section 8.</p> <p>3(b). Section 8.3 has been updated and specifically sections 8.3.1, 8.3.1.2, 8.3.3, 8.3.4.1, 8.3.4.2 (8.3.4.2.2 and 8.3.4.2.3, 8.3.4.2.5), 8.3.5, 8.3.7, 8.3.9 to include consideration of wetlands as aquatic habitat features within the context of changes to water quality and sediment quality within the LSA due to the Project. Sections 9.2.4.2.1, 9.2.6.2.1, 9.2.6.4.1, 9.2.7.3, and 9.2.9 have been updated to be aligned with Section 8.</p> <p>4. Denison is committed to conducting surface water quality and sediment quality in wetlands within the LSA and specifically in wetlands directly adjacent to the Operation prior to construction commencing for the purposes of collecting baseline to further assess the success of mitigative measures.</p>	<p>Responses to items one and four have been accepted, but items two and three require additional information.</p> <p>For item two, the Proponent has not included justification regarding why they have relied on measurements upstream and downstream of the wetlands over direct measurements in the wetland areas within their response. Please provide the missing justification for item two, as well as describe how baseline information will be used to further assess the effectiveness of mitigation measures. Water and sediment quality in wetlands differ than those in stream and lakes systems because of their distinct biota and hydrology. In wetlands, there is a greater cycling of nutrients, more nutrients and metals can be sequestered in sediment, and metal toxicity modifying water quality factors such as pH and dissolved organic carbon are not the same as in streams and lakes. Baseline data on water and sediment quality in wetlands are necessary to evaluate potential effects on fish and fish habitat of proposed discharge to Whitefish Lake upstream of the wetlands. The information would also be used to assess possible effectiveness of proposed mitigation measures.</p> <p>For item three, the Proponent has not provided the predicted sediment quality impacts within item three, which is part of the wetlands assessment that was requested.</p> <p>Please also update Section 8.3 to include additional information on predicted sediment quality impacts to wetlands and to provide an assessment of potential effects to wetlands from sediment quality changes within the LSA.</p> <p>This Information is required in order to identify and define potential effect pathways linked to project-related changes to wetland sediment quality and assess effects on wetland functions, fish and fish habitat, and other valued components. Potential effect pathways in wetlands can be different than those in lakes and streams and warrant a separate assessment.</p>	<p>Per the Round 3 IR, responses to items 1 and 4 from the Round 2 IR have been accepted, but items 2 and 3 require additional information.</p> <p>For Item 2, for clarity ECCC specified during the meeting on June 14, 2024, that the wetlands of interest are those located within the nearshore environments of Whitefish Lake (Upper, Mid and Lower) as these lakes will directly receive treated effluent during operation.</p> <p>Water quality was sampled both upstream (river inlet to lake) within the lakes and downstream (river outlet of lakes) (e.g., SA4, SA-5, SA-6, LA-5 and LA-6; refer to Appendix 8-D for the aquatic baseline report including photographs of water quality sampling areas for context). As identified in Denison's response to the IR-107 (round 3), the baseline water quality variability was very low between these stations and therefore overall representative of the LSA and encompassing depositional and non-depositional environments. This was deemed appropriate and suitable for the scale of the EIS.</p> <p>The rationale for using water and sediment quality specific to the inlet/lake/outlet is further described below.</p> <p>Surface water quality modelling included predictions of water and sediment concentrations in Whitefish Lake, the lake into which treated effluent will be released, as well as locations farther downstream. Water quality was predicted as the incremental change in constituent concentrations during periods of effluent discharge on a monthly time step. Sediment quality predictions (as concentrations of constituents in sediment) were made on the same time step from surface water concentrations using the partitioning coefficients (Kd). The Kd values are presented in Table 3-6 of the ERA. They consist of regional published values that have been calibrated on similar sites in northern Saskatchewan over several years and have been checked against Wheeler River measurement data as shown in Figure 3-2 and Figure 3-3 of the ERA.</p> <p>For the purposes of the analysis the Kd value was used for a lake environment meaning that one estimate of sediment quality was assumed to be reasonable for the purposes of the EIS because the wetlands are directly connected to the lake as they are functional nearshore environments of the waterbody itself.</p> <p>The wetland portions under discussion are more accurately described as littoral areas and these wetland portions are not cut-off from or</p>	<p>Denison has not adequately responded to the request to identify potential effects to sediment quality to support identification of project-related effect pathways to wetlands. The Kd values could differ significantly in wetland environments compared to in lake/stream measurements where all samples were taken and there are discrepancies in wetland classification within the EIS and information provided in IRs with the actual classification standards for various wetland types.</p> <p>For further explanation, the descriptions of the wetland areas provided in the round 3 response do not correspond to information provided in the last round of responses received from Denison. For example, Figure 2 of Appendix 8-F: Wetland Effects Assessment Report identifies a black spruce treed bog (ecotype BS17) between Whitefish Lake North and Whitefish Lake Middle (La-5), where effluent will be discharged. According to the Canadian Wetland Classification System (Warner &amp; Rubec, 1997), bogs are defined as receiving water only from precipitation, with no hydrological connections to groundwater or littoral areas. This does not match with the response of “<i>littoral areas and these wetland portions are not cut-off from or isolated from the main basin of the lake.</i>” The response also does not correspond to the BS17 ecotype described in Appendix 9-B: Terrestrial Environment Wildlife and Vegetation Baseline Inventory.</p> <p>The uncertainty introduced as to the conditions on site complicates the discussions on baseline conditions and potential impacts in wetlands which the Proponent assumes to provide fish habitats. Bogs and fens (ecotypes BS17, BS18, BS19, BS21) are identified in and around Whitefish Lake and these wetlands will have different water and sediment chemistry than lakes and creeks. For example, the partitioning coefficients of sediments in a fen would not be expected to be the same as those in a lake, though both may be depositional environments, sediments in the fen would be richer in organic matter because of the vegetation present. Organic matter in sediment is an important factor affecting soil-water partitioning coefficients. Because of this, the sediment in wetlands is likely to adsorb more metals than sediment found in lakes. So it is important to understand baseline conditions and model impacts in order to ensure the aquatic environment will not be impacted by the project’s planned discharges.</p> <p>The Proponent should clarify if the wetlands were misidentified in the Terrestrial Environment Wildlife and Vegetation Baseline Inventory. If they have been misidentified, then corrections should be made to the Baseline Inventory and Wetlands Assessment Report, and information provided in the Proponent’s round 3 response should be integrated in Section 8.3 of the EIS. If they have not been misidentified, then the Proponent should respond to round 3 information requests considering the wetland environment.</p> <p>In order to resolve this IR, Denison are expected to:</p> <p>1. Update wetland classification in the LSA according to the Canadian Wetland Classification System (Warner &amp; Rubec, 1997). Focus should be applied to</p>	<p>Denison reaffirms the approach taken with baseline sediment data as utilized in the EIS and more specifically in the ERA (e.g., pooled sediment data from locations in an unperturbed system in the same watershed where land use and type is homogeneous) as an appropriate and acceptable basis to define existing conditions (and the variability thereof) and to identify potential Project effects to sediment and evaluate the significance of these effects. The IMPACT model predicts how constituents travel through the environment and concentrations of constituents change as a result of interactions with natural flows and lake sediments. The Kds applied in the model have largely over predicted the baseline sediment concentrations throughout the lakes demonstrating that the model and model inputs are conservative, and impacts (i.e., incremental changes in constituent concentrations resulting from Project emissions to the aquatic environment) have not been under predicted.</p> <p>For context on a sensitivity analysis for sediment quality predictions, refer to Appendix 10-A, Section 6.2.2 Effluent Discharge Rate. A sensitivity analysis of key model parameters was undertaken to understand the degree to which the results or conclusions of the risk assessment would vary if parameters differed from what was assumed. In this section, sediment predictions are shown for a scenario where effluent is released at the maximum upper bound rate of 81 m³/hr and the maximum concentrations of COPCs in the receiving environment increases up to 120%. It is also a conservative prediction in that it assumes effluent is released during decommissioning at the same upper bound flow and quality as during operations. In this sensitivity analysis, the modelled concentrations of all COPCs are expected to be below their corresponding sediment quality guidelines, with the exception of cadmium, molybdenum, selenium and vanadium; however, the predicted exceedances for cadmium, molybdenum, selenium and vanadium are all below their probably effect level (PEL), no-effect (NE2), or severe effect level (SEL) values, therefore, adverse effects to benthic communities are not anticipated under the upper bound discharge scenarios.</p> <p>Importantly, monitoring programs will be implemented to assess the environmental performance of the Project relative to the predictive assessment that has been completed in support of the EA process. Such monitoring is needed since there is always some level of uncertainty associated with EA predictions (and it is noted that uncertainty analysis has been completed as part of the EIS and considered within the context of assessing the significance of effects).</p>

		<p>within wetlands. Potential effects from COPCs and radionuclides to surface water and sediment, or potential effects to ecological receptors within wetlands have not been evaluated.</p>		<p>of site are approximately between 499 and 497 masl</p> <ul style="list-style-type: none"> <li>Wetlands north of the SSA and in the vicinity of the proposed air strip range from 514-508 masl.</li> <li>Wetlands situated further north of the SSA in the LSA were at an elevation of approximately 526 masl</li> <li>Southern wetlands that will interact with the proposed hydro corridor extension for the mine have an elevation of 491masl</li> <li>Most wetland evaluated south of the SSA had elevations ranging from 491-488 masl</li> </ul> <p>e. <i>Wetland Depth</i> – information associated with wetland depth for those in the LSA is not available.</p> <p>f. <i>Wetland Flow Pathways</i> - Nearly all wetlands are connected or adjacent to rivers and tributaries, and thus flow pathways are discernable in <b>Figure 9.2-8</b> of the draft EIS.</p> <p>g. <i>Presence of Fish and Fish Habitat</i> For the purposes of this assessment the bogs and fens within the area can be assumed to provide supporting fish habitat to the adjacent lake and river water bodies in the vicinity of the LSA. Section 9.2.6.4.1 of the draft EIS described the estimated change in the aerial extent of wetland due to direct impacts of the Project footprint (see also Figure 9.2-8). The assessment indicated a total loss of 0.5 ha (less than 0.1%) of all wetlands within the Terrestrial RSA.</p> <p>2) As noted in other parts of this IR response, the wetlands within the Project footprint are limited to two areas (i.e., stream crossings along the access road to the airstrip and powerline connection SE of Highway 914 [See Figure 2: Denison Wheeler River Project SSA and Wetland Feature Distribution in Attachment IR-101]) and these wetland areas can be avoided through design and construction mitigations. As such, no direct impact to any wetlands or waterbodies are expected as part of the Wheeler River Project that may impact fish or fish habitat.</p> <p>In regard to baseline information on wetland surface water and sediment quality characterization for wetlands within the Project footprint:</p> <p>a. <u>Surface water quality in wetlands</u> – surface water quality was not specifically sampled in the wetland complexes adjacent to the project footprint during the original baseline assessment. However, surface water quality was sampled and assessed at stream and lake stations situated upstream and downstream of wetland areas. These stations were selected for sampling as they were identified as providing repeatability (i.e., relative water depth) and informative with respect to desired segments of the system. For example, water quality was sampled at SA-4, SA-5, LA-6, SA-6 and LA-5</p>	<p>information on the wetland areas.</p>		<p>isolated from the main basin of the lake. As such, it can be assumed that the lake environment is likely to be as depositional as the nearshore environment. The lakes of interests are very shallow (on average 1.5 m in depth) and therefore deposition may be as likely in the “offshore” environment as the nearshore.</p> <p>The wetlands are not likely to have a dominating effect on the water quality of Whitefish Lake due to their lesser aerial extent vs. the lake proper and the connectivity between the zones suggests that water quality would be similar between the shoreline and the “offshore” (i.e. likely good exchange).</p> <p>With respect to Item 4, and to further confirm these assumptions discussed above, Denison has committed to the collection of additional baseline information with the wetlands for water quality and sediment quality prior to construction as part of operational licencing (Commitment 8-46).</p> <p>Denison has also committed to conducting a pre-construction preliminary EEM for the site. The EEM study design will be further guided by the final design of the diffuser and the behaviour of the effluent plume (Commitment 8-49).</p> <p>Based on this and if applicable, the EEM study design could include an investigation of the differences in WQ and SQ nearshore and offshore. This would allow for an understanding of the differences in water to sediment contaminant ratios between nearshore and offshore environments.</p>	<p>updating areas with hydrological connections to groundwater and littoral sources, which may have been misclassified as bogs. This should include any sub-classification of wetlands currently categorized as Shallow Open Water in Appendix 8-F: Wetland Effects Assessment Report. Updates should be made as necessary to all relevant reports, including the Terrestrial Environment Wildlife and Vegetation Baseline Inventory as needed.</p> <p>2. Update habitat mapping for wetlands to reflect any changes in wetland classifications, particularly for wetlands that may include fish and fish habitat.</p> <p>3. Update Table 8.3-3 and 8.3-4 in Section 8 of the EIS to include more specific information on wetlands that may contain fish and fish habitat, such as information on wetland type &amp; extent, vegetation, substrate type, organic matter content, etc.</p> <p>4. Provide a table with summary statistics (grain size analysis and sediment quality) from sediment sampling specific to each individual sampled lake or stream, rather than summary statistics for all waterbodies and watercourses pooled together.</p> <p>5. Provide the source reference for the Kd values used for the ERA in Table 3-6 and the specific characteristics of sediments (i.e. grain size and composition) of the regional study areas as they compare to LA-5, the LSA and the RSA.</p> <p>6. Conduct a statistical analysis with a power analysis comparing sediment characteristics (grain size analysis and sediment quality) from the various sub-samples taken within each waterbody to conclude if there are any significant differences between sub-sampling stations, and determine if there is within-lake variation in sediments. Denison should provide the methodology they will use to conduct the statistical analysis and power analysis for CNSC review and acceptance prior to completing the analysis. Based on the results of this statistical analysis, Denison should:</p> <p>a. If the results determine that there is enough statistical power to confirm there is no within-lake variation in sediment characteristics within LA-5, Denison should then complete a statistical analysis and power analysis comparing LA-5 to other sampled areas to determine if there is any between-lake variation in sediment characteristics.</p> <p>b. If the results determine that there is not enough statistical power, or that there is enough statistical power but there is significant within-lake variation between sub-samples in LA-5, Denison will require the additional baseline data that Denison has already committed to collecting, to update the modelling during the EA phase to support conclusions on significance of effects to the receiving environment.</p> <p>This IR relates closely to IR-107 that demonstrates that there is not enough</p>	<p>Specific to this IR, sediment sampling will be completed to verify the accuracy of predicted effects and the effectiveness of proposed mitigation measures.</p> <p>Monitoring and follow-up programs will be integrated within Denison’s overall Environmental Management System (EMS) framework and implemented through the various programs, plans and procedures that would be developed therein. Denison is committed to achieving continual improvement in environmental performance through its EMS. As part of this overall commitment to continual improvement, monitoring programs will be implemented via an adaptive management approach. Adaptive management is a systematic process for continuously improving environmental management practices by learning from their outcomes. It provides the flexibility to address/accommodate new circumstances, to adjust monitoring, to identify and implement new mitigation measures, or to modify existing measures throughout all Project phases. Further, it provides a means to confirm that the monitoring elements remain valid, meet regulatory requirements, and be responsive to evolving objectives.</p> <p>At the EIS stage, the conceptual plan is for sediment sampling at Whitefish Lake South (near-field), at an upstream reference location (Whitefish Lake North), and at downstream locations (far-field) every three years. The far-field monitoring locations will be located in Whitefish Lake South prior to its discharge to McGowan Lake. The details of the sediment monitoring program will be refined as the Project advances. Sediment constituent concentrations will be compared to the values used in the EIS and to applicable regulatory criteria or objectives. As noted, above sampling effort will be predetermined that meet the rigor required of federal / provincial requirements as described in relevant technical guidance documentation for operational monitoring.</p> <p>In general, applying equally to sediment quality as with all other environmental aspects that have been considered in the EIS, where an environmental monitoring program identifies predicted effects are greater than anticipated, Denison would evaluate whether these effects could result in changes to the conclusions in this EIS. If changes are confirmed, then Denison would evaluate the need for revised mitigation actions and management practices to manage effects. As highlighted above, Denison’s interpretation of monitoring data would include reference to environmental performance criteria. An exceedance of environmental performance criteria would trigger Denison to respond to further investigate the potential issue. Based on this investigation, where need for revised mitigations is identified these measures would be developed and implemented. It is expected that the adaptive management process would be informed by input sought from Indigenous people,</p>
--	--	---	--	--	--	--	--	--	---

				<p>following the flow path from upstream to downstream, respectively. The water quality at these nodes was inclusive of upstream wetland influences. For further reference to surface water sampling station during baseline, please refer to Figure 8.2-4 of the EIS.</p> <p>b. <u>Sediment quality in wetlands</u> - sediment quality was not specifically sampled in the wetland complexes adjacent to the project footprint during the original baseline assessment. However, sediment quality was sampled and assessed at depositional lake stations situated upstream and downstream of wetland areas. The sediment quality at these nodes would be inclusive of upstream wetland surface water and sediment influences. For further reference to sediment sampling stations during baseline, please refer to Figure 8.2-4 of the EIS.</p> <p>3) For the purposes of this assessment the bogs and fens within the area can be assumed to provide supporting fish habitat to the adjacent lake and river water bodies in the vicinity of the LSA. Section 9.2.6.4.1 of the draft EIS described the estimated change in the aerial extent of wetland due to direct impacts of the Project footprint (see also Figure 9.2-8). The assessment indicated a total loss of 0.5 ha (less than 0.1%) of all wetlands within the Terrestrial RSA</p> <p>However, when further scrutinizing the potential overprinting of wetland features as a result of the Project it is evident that even this loss is avoidable. The interaction of the Project with wetlands is relegated to those areas where stream crossings for access roads and powerline connections are proposed (<b>See Figure 2: Denison Wheeler River Project SSA and Wetland Feature Distribution (Attachment IR-101)</b>).</p> <p>Wetlands associated with stream crossings have been identified to have mitigative designs (clear-span) to ensure no impacts to fish and fish habitat. The hydro-line as shown in Figure 1 will be constructed to avoid direct impacts to fish and fish habitat following best installation practices. As such, no direct impact to any wetlands or waterbodies are expected as part of the Wheeler River Project that may impact fish or fish habitat.</p> <p>As discussed in Section 8.1.6.1 of the EIS, water levels in the ponds and lakes in the vicinity of the of the Project are expected to experience negligible effects, with magnitudes of changes in water levels predicted to be in the sub-centimeter range. As natural fluctuations in lake water levels were approximately 0.4 m from 2011 to 2019, Project-related changes are not expected to be of a magnitude to compromise the Surface Water Quantity VC. It can then be considered a reasonable assumption that any changes to wetland features will have similar sub-centimeter impacts to water levels due to changes in surface flow and/or groundwater and therefore do not pose an indirect effect to water quantity or fish and fish habitat associated with these wetland features.</p> <p>4) As no impact is expected due to overprinting or due to draw down effects by the ISR, additional mitigation measures are not warranted. Updated baseline information on wetland depths and water-levels may be useful in providing a frame of comparative reference to potential changes during the operation, decommissioning and post-decommissioning phases of the</p>				<p>baseline data to support conclusions on significance of effects.</p>	<p>stakeholders, and regulatory agencies.</p> <p>The following section provides a response to each to the specific IR questions:</p> <p>1. The project's ecosite classification is outlined in Section 9. Ecosite classification was completed using the Guide to the Ecosites of Saskatchewan's Provincial Forests (McLaughlin et al. 2010) Ecosite information was transferred directly into Appendix 8-F which originated in January 2024 during the EIS review process in response to FIRT IRs.</p> <p>Refer to Section 9 for the wetland assessment and Appendix 9-B for the terrestrial baseline report with information on ecosite mapping in Section 2.1.3 and ecosite characterization methods and results in Section 2.2. The measurable parameter for the wetlands assessment in Section 9 was change in areal extent of wetlands; this was also considered in Appendix 8-F.</p> <p>The EIS guidelines do not require use of the suggested classification scheme (Canadian Wetland Classification System (Warner &amp; Rubec, 1997). Denison used information from the province's land classification system and have fulfilled that EIS requirement.</p> <p>Effectively, to be conservative in one assessment (assessing change in areal extent of wetlands in Section 9) we have introduced questions and confusion in Appendix 8-F. The data was fit for purpose for Section 9 and to be consistent, it was carried over into Appendix 8-F without any adjustments or reclassifications.</p> <p>This IR is not questioning the assessment of changes in areal extent of wetlands, but the purported under estimation of risk through the effluent modelling. As such, no updates to the wetland classifications are warranted at this time. Further, Denison has committed to completing additional wetland studies (see response to point 2).</p> <p>2. Additional wetland surveys will be completed after the EA stage, per commitment 8-46 in Denison's commitment register (i.e., "To further supplement existing information that exists for the LSA wetlands, Denison is committed to undertaking wetland surveys including the collection of water quality, sediment quality, benthic invertebrates and fish and fish habitat surveys prior to the construction to provide an updated baseline for assessing the success of mitigation measures and to assess potential effects of the project on wetlands. These locations will then be further considered as part of the EMP for continued monitoring for these media and biota.").</p> <p>Appendix 8-F has been updated and specifically, a new appendix (Appendix A) has been added. This new appendix provides photos and text to orient the reviewer to the in-lake wetlands of interest. While some of these in-lake areas were conservatively classified as wetlands in the terrestrial assessment (EIS Section 9), from an aquatic perspective, these in-lake wetlands of</p>
--	--	--	--	--	--	--	--	---	---

				<p>project. However, such changes are expected to be less than measurable.</p>						<p>interest are littoral / nearshore zones in the lake and connecting channels.</p> <p>The balance of this IR response outlines the rationale for why the CNSC’s suggested wetland mapping updates to the EIS would not change any EIS conclusions and are not required at this stage for EA determination.</p> <p>3.Any wetlands that were present within water bodies, were mapped as part of the baseline program and results would be incorporated into the existing fish habitat summaries provided in Tables 8.3-3 and Table 8.3-4. Refer to Section 8.3.3 for the existing environment methods and results. It is noted in the EIS that detailed information regarding fish and fish habitat baseline data collection and analyses are provided in Appendix 8-D, Appendix 8-B, and additional information pertaining to wetlands is provided in Appendix 8-F.</p> <p>4. Sediment grain size results for McGowan Lake, Whitefish Lake south, Whitefish Lake north and Russell Lake are summarized in EIS Section 8 Table 8.4-2, and sediment chemical composition results are summarized in Table 8.4-3.</p> <p>The baseline sediment grain size and chemistry analysis for all stations within the baseline study area are provided in Appendix 8-D Aquatic Baseline, Tables A-3 and A-4 of Appendix A, respectively.</p> <p>5. A summary of the source reference for the Kds is provided in Attachment IR-101 (Round 4), and a discussion on sediment grain size for the Wheeler River and regional study area is also provided.</p> <p>6. Based on discussions between the CNSC and Denison in September 2024, the primary request from the CNSC was related to additional information on the IMPACT Kds, which has been provided as part 5 of this response. The requested power and additional statistical analyses can be completed as part of licensing and will include results from pre-operational sediment sampling. Any pre-operational sediment sampling results will be included in the environmental risk assessment (ERA) update to support Denison's application for a licence to operate. Additionally, the pre-operational sediment sample results in combination with existing data will be the basis of future comparisons of measured data from effluent exposed and reference areas. Such comparisons would be based on statistically based study designs that meet the rigor required of federal / provincial requirements as described in relevant technical guidance documentation for operational monitoring.</p>

## 1.0 Introduction

On October 21, 2022, Denison Mines Corp. (Denison) submitted a draft Environmental Impact Statement (EIS) for the proposed Wheeler River Project (the Project). Based on their initial review, the Canadian Nuclear Safety Commission indicated that the submission contained the required information to proceed with the Federal-Indigenous Review Team (FIRT) technical review of the draft EIS. On March 20, 2023, the FIRT provided Denison with a list of information requests (IRs) for Denison to respond to and eventually submit a final EIS document. Responses to these IRs were provided in July and August of 2023. Additional FIRT IRs were provided to Denison on December 5, 2024. Of these IR-101 was not adequately answered and additional information was requested.

This appendix provides additional information to address IR-101 provided by Environment Canada and Climate Change (ECCC) as part of the second round of FIRT comments. The comment included a request for a further summary of wetland characterization information from available sources, baseline information pertaining to water quality and sediment quality, and assessment of potential effects to wetlands within the LSA for all phases of the Project and provide further information on mitigation measures and monitoring that would be applied for the protection of wetlands.

## 2.0 Scope of the Assessment

This section addresses the potential effects of the Project on the Fish and Fish Habitat VC for which wetland habitats are considered a component. The purpose of this assessment is to assess potential changes to wetlands (as represented by the Fish and Fish Habitat VC) in consideration of all phases of the Project at the Project Area, local, and regional study area scales. Pathways affecting wetlands are directly associated with potential changes to the Surface Water Quantity (hydrology), Surface Water Quality, Sediment Quality, and Benthic Invertebrates VCs. Changes to

hydrology, water quality, sediment quality, and benthic invertebrate communities may directly affect wetlands as both fish and wildlife habitat and food resources. The assessment approach reflects these connections within the environment, as the significance determination for the Surface Water Quantity and Surface Water Quality VCs was conducted at the receptor VC level.

The Vegetation and Ecosystems, Listed Plant Species, and Wetlands VCs are interrelated, to varying extents, and are linked to other VCs, including:

Surface Water Quality – surface water contributes to local moisture regimes, and surface water quality can influence the persistence of Vegetation and Ecosystems, Listed Plant Species, and Wetlands.

Surface Water Quantity – surface water contributes to local moisture regimes, and surface water quantity contributes to site drainage and discharge, which can influence the persistence of Vegetation and Ecosystems, Listed Plant Species, and Wetlands.

Sediment Quality – Vegetation and Ecosystems, Listed Plant Species, and Wetlands contribute to ecosystem form and function that stabilize riparian areas and influence quality of surface water runoff to aquatic systems.

This appendix will focus on the interrelations between these VCs as they apply to Wetland function.

Pathways that are of interest include those associated with site clearing and the potential for erosion-driven mobilization of suspended sediment into local surface waters; groundwater interactions with surface water features including wetlands; the establishment of new subwatershed boundaries and the resulting effects of effluent discharge to the receiving environment; and the potential overprinting of wetland habitat by Project infrastructure.

## **2.1 Key indicators and Measurable Parameters**

The KIs for the wetland component of the Fish and Fish Habitat VC include potential changes in surface water quantity, surface water quality, and available wetland habitat from baseline conditions. The rationale for each KI and associated MPs is summarized in Table 1.

**Table 1: Key Indicators and Measurable Parameters for the Wetlands Valued Component**

Key Indicator	Rationale for Key Indicator	Measurable Parameter
Change in available wetland habitat from baseline conditions	2. Project activities may result in a change in the extent of Wetlands. 3. Of provincial and federal management concern 4. Contributes to biodiversity and habitat for wildlife species and listed plant species. 5. Cultural importance. 6. Contributes to biodiversity, maintenance of hydrologic cycles, nutrient cycling, water quality, and carbon storage. 7. Sensitive to disturbance. 8. Historically addressed for other mining projects in northern Saskatchewan.	Aerial extent (m <sup>2</sup> or ha) of overprinted wetland habitat.
Change to water levels or flows from baseline conditions	Project activities are expected to result in changes to local hydrology. A reduction or increase in flows may result due to the elimination or redirection of subwatershed area and through Project water management (i.e., water taking, storage, and effluent discharge). These changes in flow to the environment may alter stream flows, lake levels and such feature interactions (inundation) with wetland features required for fish and wildlife during all life stages.	Changes in water levels (m) or percent changes to flow conditions (%).
Change in surface water quality from baseline conditions	Changes in water quality are regulated (subsection 36(1) of the <i>Fisheries Act</i> and the MDMER). Changes that may occur as a result of the Project include: <ul style="list-style-type: none"> <li>• mobilization of solids into local watersheds; and</li> <li>• deposition of deleterious substances into the receiving environment as a result of mine effluent and/or surface runoff.</li> </ul>	Change in the concentration of constituents that are directly related to Project activities, measured as a mass of a chemical per unit volume in water (e.g., mg/L).

## 2.2 Spatial and Temporal Boundaries

The areas used to assess the effects of the Project on the Vegetation and Ecosystems, Listed Plant Species, and Wetlands VCs are (Figure 1):

**Project Area:** the area within which the Project and all components/activities are located (i.e., the area of maximum physical disturbance). The Project Area is considered to be a conservative estimate of the area of direct disturbance effects on VCs in this assessment.

**Vegetation LSA:** the area that surrounds the Project Area where all direct effects and most indirect effects are likely to occur on the Vegetation and Ecosystems, Listed Plant Species, and

Wetlands VCs. The Vegetation LSA is defined as the Project Area plus a 250 m buffer along roads and a 500 m buffer around all other infrastructure (1,161.8 ha).

**Terrestrial RSA:** the area that surrounds and includes the Vegetation LSA, established to assess the potential, largely indirect effects of the Project on Vegetation and Ecosystems, Listed Plant Species, and Wetlands VCs in a regional context. The Terrestrial RSA (40,173.6 ha) is defined as a minimum 8 km buffer around the Vegetation LSA and has been delineated to capture all indirect effects of the Project on the Vegetation and Ecosystems, Listed Plant Species, and Wetlands VCs and provide context for the type, distribution, extent, and prevalence of plant species and ecosystems in the region. The Terrestrial RSA also defines the area within which cumulative effects are likely to occur (i.e., CEA boundary).

Temporal boundaries identify when an effect is expected to occur in relation to specific Project phases and activities. The temporal boundaries are based on the timing and duration of Project activities, with the associated interactions with each VC and KI (where applicable). In the EA, the temporal boundaries are described as appropriate for each activity and cumulatively for the life of the Project.

The temporal boundaries for the EA represent the timeframes that the Project is expected to interact with and potentially affect Vegetation and Ecosystems, Listed Plant Species, and Wetlands VCs. The temporal boundaries are aligned with the Project development schedule as described in the EIS: Construction; Operation; Decommissioning; and Post-Decommissioning.

### 3.0 Existing Conditions

Wetlands are defined as “land that is saturated with water long enough to promote wetland or aquatic processes as indicated by poorly drained soils, hydrophytic vegetation and various kinds of biological activity which are adapted to a wet environment” (National Wetlands Working Group 1997). As such, ecosites have been determined to be wetland ecosystems where these conditions are expected to occur. This includes both wetland ecosites and sparsely vegetated ecosites where the water table is within 50 cm of the ground surface (McLaughlan et al. 2010). No wetlands within the Terrestrial RSA have been designated as Ramsar Wetlands of International Importance (The RAMSAR Convention Secretariat 2022).

Project-specific investigations pertaining to the Terrestrial Environment were conducted by Omnia Ecological Consulting (Omnia; Calgary, AB) from 2017 to 2019. Details on the methods, survey parameters and assumptions, and comprehensive data summaries/findings are presented in the Project-specific baseline report (Omnia 2020; see **Error! Reference source not found.** of the EIS) and a supplementary baseline annex report completed in 2021 (EDI 2021; see **Error! Reference source not found.** of the EIS).

Project baseline studies for vegetation presented a description of the ecosystems/habitat types (i.e., ecosite classifications) within the Terrestrial RSA. Vegetation communities and ecosystems are represented by provincial ecosite classifications for the Boreal Shield Ecozone in accordance with the Field Guide to the Ecosites of Saskatchewan's Provincial Forests (McLaughlan et al. 2010). These ecosite classifications were summarized within a 1:20,000 interpreted ecosite mapping product compiled within the Terrestrial RSA with the use of the following inputs:

- 1:5,000 anthropogenic features mapping;
- historical fires data;
- provincial Predicted Ecosite Mapping;
- current and historical imagery; and
- field sampling/ground truthing sites (EIS Appendix 9-B).

As the Boreal Shield Ecozone experiences a largely natural fire regime, much of the vegetation within the Terrestrial RSA (70.6%) is comprised of post-fire regeneration (i.e., shrubby structural stages). Twenty (20) upland ecosites were identified within the RSA with relative percentages by area estimated for each ecosite code.

The assessment also identified fourteen (14) wetland ecosite types within the RSA which included swamps, bogs, fens and shallow open water ecosite codes. The area of these wetlands was also estimated to provide a relative percent area of representation within the RSA.

This cataloguing of ecosite presence and relative area composition across the RSA provides the basis for understanding landscape change and succession over the course of the construction and operation of the Wheeler River Operation.

Waterbodies were conservatively included here as wetlands, as they have the potential to be classified as shallow open water wetlands (i.e., water bodies 2 m deep or less; Warner et al. 1997). Waterbodies represent the most common wetland ecosystem within the Vegetation LSA and the Terrestrial RSA, comprising 3.9% (44.9 ha) and 10.7% (4,101.9 ha), respectively. The black spruce treed bog is the second most common wetland ecosystem within the Vegetation LSA (18.2 ha, 1.6%) and the Terrestrial RSA (1,157.1 ha; 2.9%). The Labrador tea shrubby bog is the most common wetland ecosystem in the Vegetation LSA, comprising 2.0% (23.3 ha), and the second most common wetland ecosystem in the Terrestrial RSA (989.9 ha, 2.5%). All other wetland ecosites are relatively uncommon, each comprising less than 0.5% of the Vegetation LSA and

Terrestrial RSA. The location, size and relative area composition of the wetland features is provided in Table 2 and Figure 1).

**Table 2: Summary of Wetlands**

Ecosite Code <sup>1</sup>	Ecosite Description <sup>1</sup>	Structure Code <sup>2</sup>	Vegetation LSA (ha)	Vegetation LSA (%)	Terrestrial RSA (ha)	Terrestrial RSA (%)
<b>Swamps</b>

<b>Total Wetlands<sup>5</sup></b>			<b>98.3</b>	<b>8.5</b>	<b>6,661.1</b>	<b>16.6</b>

**Notes:**

- 1 Ecosystems are described in detail in the Guide to the Ecosites of Saskatchewan's Provincial Forests (McLaughlan et al. 2010).
- 2 Modified from the Field Manual for Describing Terrestrial Ecosystems (BC Ministry of Environment, Lands, and Parks, and BC Ministry of Forests 1998). 0 = unvegetated; 1 = sparse / bryophyte / lichen; 2 = herb/graminoid; 3a = low shrub; 3b = tall shrub; 5 = young forest, 6 = mature forest.
- 3 This ecosite type is an artifact of mapping uncertainty, as baseline mappers were unable to distinguish between these ecosites due to a lack of available information (e.g., soil information, vegetation field plots, water quality data). As such, this ecosite has conservatively been split between bog and fen classifications.
- 4 Areas of open water <2 m deep are defined as shallow open water wetland ecosystems (National Wetlands Working Group 1997); as such, unnamed waterbodies and areas of open water observed to exhibit an average depth of <2 m (Ecometrix Incorporated 2020) have been conservatively included as wetland ecosystems.
- 5 Some numbers are rounded for presentation purposes. Therefore, the totals may not equal the sum of the individual values.

**Figure 1: Wetlands, Waterbodies and Lakes within the Project Study Areas**

**DATE:** 19 January 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

Surface elevations for the wetland have been assessed and the information is summarized below and in the Figure 1 .

- Wetlands 1.5 km west of the Project Area range from 526-524 masl
- Waterbodies and their surrounding wetlands directly to the east of the SSA are at an elevation of between 506 and 500 masl
- Waterbodies and surrounding wetlands 2 km east of site are approximately between 499 and 497 masl
- Wetlands north of the Project Area and in the vicinity of the proposed air strip range from 514-508 masl.
- Wetlands situated further north of the Project Area in the LSA were at an elevation of approximately 526 masl
- Southern wetlands that will interact with the proposed hydro corridor extension for the mine have an elevation of 491masl
- Most wetland evaluated south of the Project Area had elevations ranging from 491-488 masl

Wetland depth, presence of fish or fish habitat, water quality and sediment quality are not currently available for the non-waterbody wetlands (i.e. those not identified as a lake or watercourse in Section 8 of the EIS). However, Denison is committed to conducting field surveys to collect this data prior to the initiation of construction of the Operation. This will allow for baseline information to be available to compare future changes and assess the success of mitigation measures and the predicted effects or lack thereof.

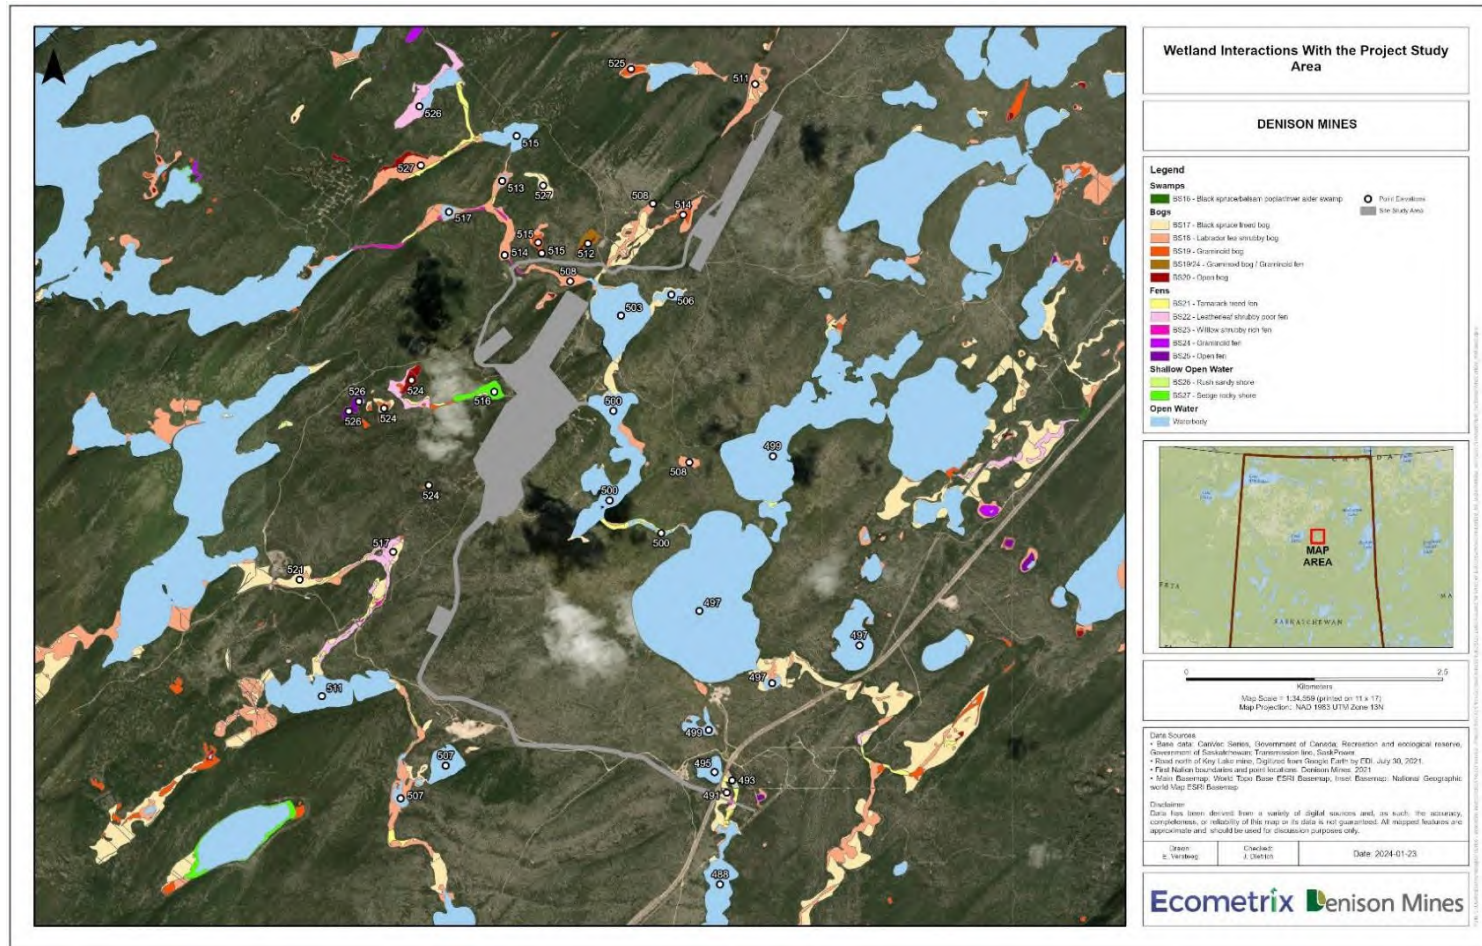

For the purposes of this assessment the bogs and fens within the area can be assumed to provide supporting fish habitat to the adjacent lake and river water bodies in the vicinity of the LSA.

## 4.0 Assessment of Project Related Effects

### 4.1 Potential Interactions Between the Project and Valued Component/Key Indicators

The Project will require the Construction, Operation, and Decommissioning of several components (as described in Section 2 of the EIS). Potential interactions between these Project components and activities and Fish and Fish Habitat in the form of Wetlands and their associated KIs are summarized by Project phase and activity in Table.

Potential interactions in Table are ranked as:

**Primary Interaction** (✓): Project activity is expected to interact with the VC / KI which may result in an adverse effect on the VC (i.e., a measurable or detectable change in the MP) and is further considered in the effects assessment as the primary contributor to potential adverse effects.

**Other Interaction** (✓): Project activity is expected to interact with the VC / KI. While the interaction is further considered in the effects assessment, it is not expected to be a primary contributor to potential adverse effects.

**No Interaction:** Project activity is not expected to interact with the VC or the KI, no adverse effects are expected, and rationale is provided for not considering this potential interaction further.

## 4.2 Potential Project-related Effects

Based on the timing and nature of the interactions identified in Table 4, the following adverse effects have a potential to occur on the Wetland VC (Table 5). The key indicator of effects to wetlands is the change in areal extent of wetlands in the study area.

## 4.3 Mobilization of Suspended Materials

### Construction

The primary effect pathway during Construction relates to the mobilization of suspended material into natural surface water features including wetlands as a result of land disturbance and clearing. The mobilization of suspended material into natural surface water features is readily mitigatable by virtue of the mine development plan and through the implementation of standard water management and sediment control practices. Water management infrastructure (e.g., collection ditches, ponds, pumping stations) and various aspects of the water management and sediment control management systems will be put into place coincident with the initiation of construction activities. Waters (e.g., runoff) associated with areas under development will be collected and stored within management infrastructure (e.g., clean waste rock pond, see Figure 2.2-14 in Section 2 of the EIS). In the event that releases to the natural environment are necessary, they would only occur once it is safe to do so (i.e., suspended solid levels in the water would be at acceptable levels). No downstream effects on surface waters, natural sediments, fish and fish habitat including wetlands are expected.

### Operation

During Operation, mobilization of suspended materials will be managed through the development and operation of water management infrastructure and implementation of surface water management through the Surface Water Management Program. Releases of contact water to the natural environment will be directed through applicable collection ponds, the IWWTP, and the Effluent Monitoring and Release Ponds. No specific discharge is expected to wetland features in the Project Area. Discharge will only occur once it is safe to do so (i.e., suspended solids levels in the water would be at acceptable levels). Denison may employ active means (e.g., filtering), if required, to achieve low TSS levels in discharge, in addition to passive means, such as settling and clarification in the IWWTP to manage TSS in the effluent stream to low levels. No

**DATE:** 19 January 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

downstream effects on surface waters, natural sediments, or fish and fish habitat including wetlands are expected.

#### **Decommissioning and Post-Decommissioning**

During Decommissioning and Post-Decommissioning, the site-wide water management system will continue to operate such that Denison will maintain control of the site aspect affected water through the IWWTP. Surface drainage during Decommissioning activities will continue to be directed to the system of collection ponds, the IWWTP, and the Effluent Monitoring and Release Ponds to facilitate the control of suspended solids and achieve low TSS levels in the discharge, thereby minimizing any potential for adverse changes to water quality, sediment quality, and fish and fish habitat including wetland features.

### **4.4 Overprinting of Wetlands as Fish Habitat**

For the purposes of this assessment the bogs and fens within the area can be assumed to provide supporting fish habitat to the adjacent lake and river water bodies in the vicinity of the LSA.

Bogs are predicted to be the wetland class most affected by the Project, with 0.4 ha (less than 0.1%) of mapped bog ecosystems within the Terrestrial RSA expected to be disturbed within the Project Area during Construction. Fens are the next most affected, with 0.1 ha (0.1%) anticipated to be disturbed during Construction (Figure 3). Less than 0.1 ha (less than 0.1%) of shallow open water wetlands within the Terrestrial RSA are also anticipated to be affected by the Project.

Within these wetland classes, the wetland ecosite expected to be most affected is the willow shrubby rich fen (ecosite BS23) with direct disturbance to 0.1 ha predicted to occur within the Project Area (0.5% of the BS23 ecosite within the Terrestrial RSA). The remaining ecosites anticipated to be directly affected by the Project are locally abundant, with direct disturbance expected to affect <0.1% of these ecosites within the Terrestrial RSA (**Error! Reference source not found. 2**).

Investigation of the potential overprinting of wetland features as a result of the Project it is evident that wetland loss is avoidable. The interaction of the Project with wetlands is isolated to those areas where stream crossings for access roads and hydro-line connections are proposed (Figure 3). With the use of single span bridges and implementation of best management practices, direct wetland disturbance associated with the crossings of Kratchkowsky Creek and Hart Creek is expected to be avoided. It should be noted that SaskPower proposes to tap the existing I3P 138 kV line near Highway 914 and build approximately 4.5 km of new 138 kV line from the I3P tap to the Project site. SaskPower will be responsible for conducting activities such as line routing, environmental studies, and permitting, public consultation, and engineering design work as applicable to the load interconnection. As such, wetland disturbance related to

**DATE:** 19 January 2024

**TO:** Denison Mines – Janna Switzer

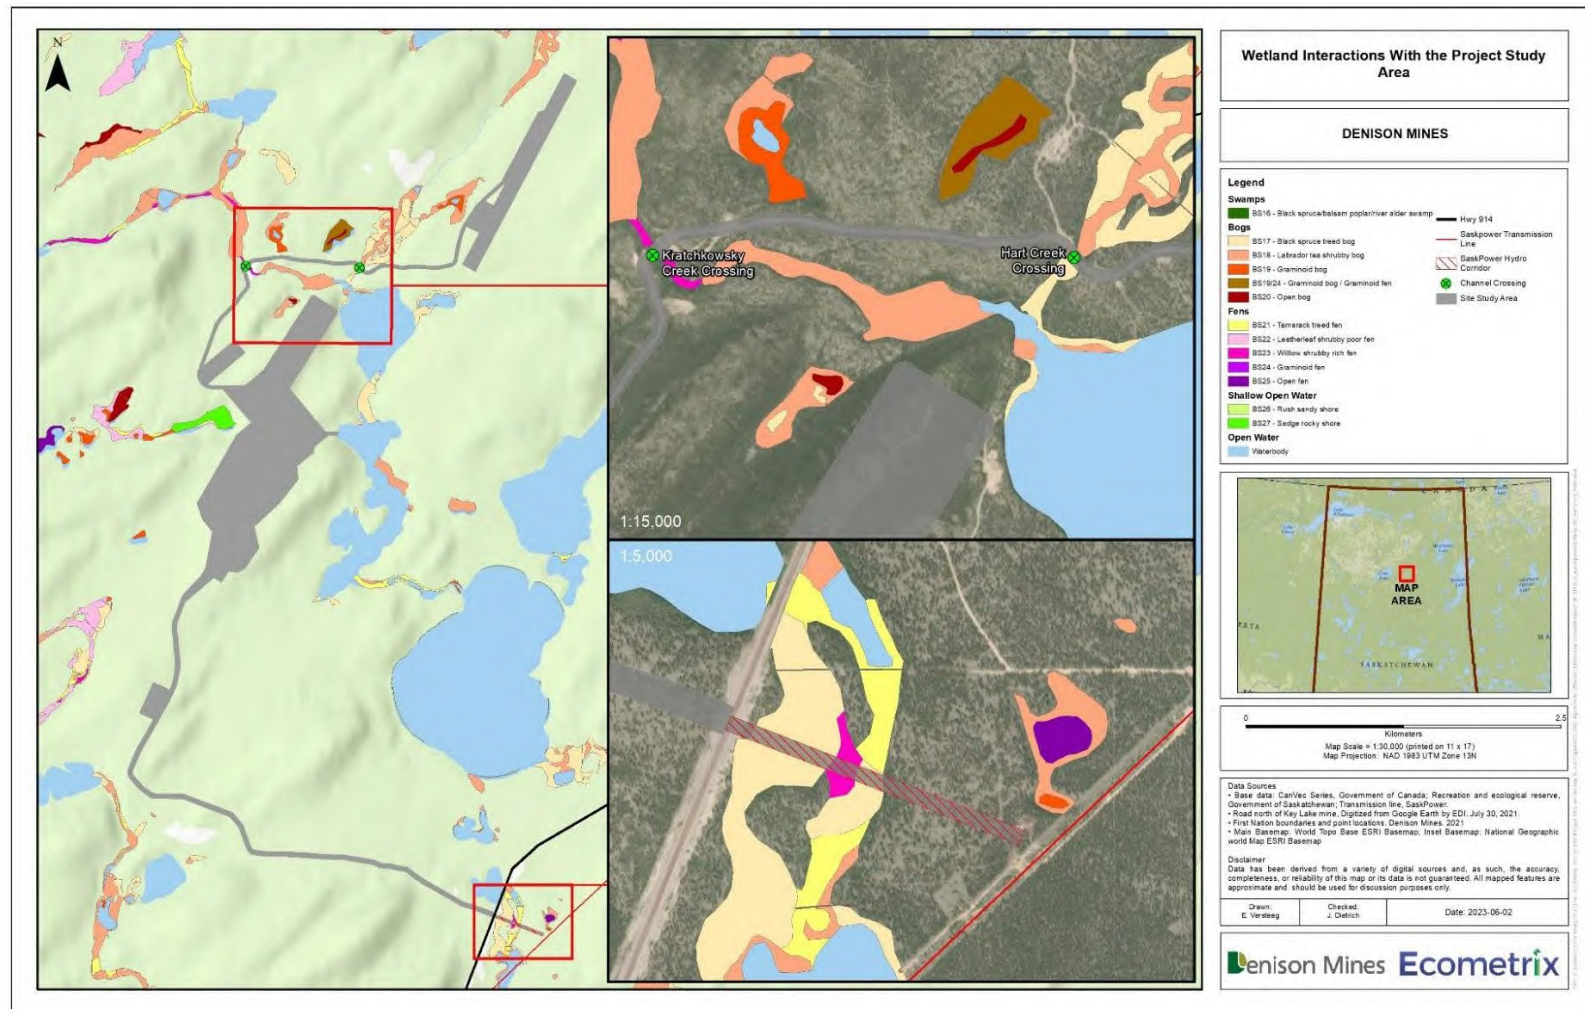

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

the SaskPower Hydro Corridor is expected to be addressed through the SaskPower permitting process.

**DATE:** 19 January 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

**Figure 3: Denison Wheeler River Project Area and Wetland Feature Distribution**

**DATE:** 19 January 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

## 4.5 Controlled Discharge to Receiving Environments

According to the site water balance (Figure 2.2-14 in Section 2 of the EIS), there is no planned discharge to Whitefish Lake during Construction. Other than LA-5 (Whitefish Lake) no other controlled discharge will occur to the natural environment and no wetlands will be impacted as a result.

## 4.6 Change in Water Levels and Flow

As detailed in Section **Error! Reference source not found.** of the EIS, the projected withdrawal and discharge rates proposed for the Project are the largest influence on the hydrological effects of the Project. The largest predicted change in streamflow rate is -3.1% at the LA-5 and SA-2 nodes (immediately downstream of the Project) during Operation and Decommissioning, as projected against the 5<sup>th</sup> percentile low flow dataset in March. Lake levels and wetlands are expected to deviate less than  $\pm 0.01$  m due to all Project influences. All Project influences on the environment are expected to return to baseline conditions during Post-Decommissioning. These changes are within the range of fluctuation of environmental flows and water levels and are unlikely to affect fish passage or life history environmental cues.

## 4.7 Introduction and/or Proliferation of Invasive Plants

Vegetation clearing and soil disturbance during Construction are expected to create conditions suitable for the introduction and proliferation of invasive plants. Vehicles and construction equipment can inadvertently transport seeds and other invasive plant propagules in tires or the undercarriage to previously unaffected areas. The effects of invasive plants on native vegetation diversity are well documented and recognized as the second greatest threat to listed species after habitat loss (Enserink 1999). Competition with native species can lead to a reduction in the growth and vigour of native species (including Wetlands), as well as changes in the diversity, structure and function of ecosystems and habitats.

The potential for the introduction and proliferation of invasive plants by transport on vehicles and equipment is expected to continue throughout Operation during wellfield and freeze wall drilling, expansion of ponds and pads, drill waste rock, process precipitates and industrial wastewater treatment plant precipitates, on-site and off-site operation of vehicles and transport of materials, package and transport of nuclear substances, and air transportation for workers (i.e., landing and taking off of airplanes). Progressive decommissioning and reclamation has the potential to introduce invasive plants on vehicles and equipment and if seed used for revegetation is not supplied from a native seed source (Polster 2003) with a certificate of analysis indicating an absence of invasive plant seeds.

The potential for the introduction and proliferation of invasive plants is expected to continue throughout Decommissioning (e.g., during closure of the ISR and freeze wells and infrastructure,

asset removal, demolition and disposal of non-salvageable surface infrastructure and materials, remediation of contaminated areas, reclamation of disturbed areas, and operation of vehicles and transportation of materials). The potential for the introduction and proliferation of invasive plants is expected to continue throughout Post-Decommissioning, but at lower levels due to reduced vehicle traffic.

## **4.8 Edge Effects**

Edge habitat refers to an area on either side of a border between vegetation communities. Edges between vegetation communities often result in altered microclimatic conditions that can influence environmental conditions further away from the edge (Bannerman 1998). Edge effects are expected to extend into areas of native vegetation and habitats at the interface of disturbed areas and undisturbed native ecosystems, and could include altered microclimatic conditions that can influence quality in habitat away from the edge (Bannerman 1998). Where edge effects occur, Wetlands may experience changes in light intensity, temperature, wind, moisture, relative humidity, and patterns of snow accumulation and melt relative to undisturbed conditions. This can, in turn, affect plant health and alter natural disturbance regimes (e.g., blowdown), plant population persistence, and the structure and function of ecosystems and habitats. If changes to microclimatic conditions or vegetative structure at an edge exceed a species habitat preference or physiological tolerance, then edge habitat may result in lower occupancy or use, reduced survival, or lowered reproductive success.

Edge effects at the interface of disturbed areas and native ecosystems are expected to occur along the edges of the Project Area resulting from vegetation clearing during site preparation and earthworks during Construction. Edge effects are expected to continue throughout Operation, Decommissioning, and Post-Decommissioning, decreasing over time as revegetation and tree growth within reclaimed areas of the Project create a gradual structural transition at forest edges, aided by natural encroachment.

## **4.9 Long-Term Transport of Groundwater Solutes to Whitefish Lake in Future Centuries**

During the 'future centuries' scenario as described in Section 8.3.1.3 of the EIS, remediation works will be completed and the site naturalized, thereby restoring drainage patterns to report to surface waterbodies. As indicated in Section 7 of the EIS, groundwater plumes may develop from residual mass remaining post-mining based on bench-scale lab tests of core flushing, and numerical modelling of reactive fate and transport. The results of this was described in Section 8.3.4.2.5 with respect to Fish and Fish Habitat and therefore wetlands.

The results of the numerical modelling (as provided in Section 7 and Appendix 10-A in Section 10 of the EIS) support the conclusion that with the implementation of appropriate mitigation during the decommissioning and restoration phases of the Project, the residual effects of the

**DATE:** 19 January 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

Project on the intermediate Groundwater VC will not result in an adverse effect on surface water. Dissolved constituent concentrations emanating over hundreds to thousands of years in the future from the deep Ore Zone to Whitefish Lake are expected to remain below fresh water environmental quality criteria in Whitefish Lake.

Although the precise location of the groundwater discharge to the surface is somewhat uncertain, the groundwater transport scenarios that have been evaluated (Appendix 7-C of the EIS) to date suggest groundwater discharge impacted from mining will most likely be relegated to Whitefish Lake. The discharge to Whitefish Lake is generally predicted to occur along the eastern shore of the lake, as this is interpreted to be the eastern edge of the underlying desilicified zone. The Laborador Tea Shrubby Bog habitat located on the eastern shore of Whitefish Lake may be in the zone of influence of groundwater discharge, yet chemically will remain below freshwater environmental quality criteria. Groundwater impacts to other surrounding wetlands will be negligible as groundwater is not predicted to discharge within any area beyond the central portion of Whitefish Lake.

## 4.10 Indirect Effects

Indirect disturbance associated with the potential to adversely affect BS19/24 includes the introduction and/or proliferation of invasive plants, edge effects, changes to water quantity and quality, and dust deposition during all Project phases (as described in Section **Error! Reference source not found.**). Wetland ecosites BS19/24 (graminoid bog/fen) and BS25 (open fen) are peatland ecosystems typically characterized by high water tables (i.e., a very moist or very wet moisture regime), while ecosite BS27 (sedge rocky shore) is a sparsely vegetated ecosystem predominated by rocky substrates, typically occurring adjacent to lakes and ponds (McLaughlan et al. 2010). Because these ecosystems rely on high water tables and existing waterbodies, alteration of water quantity would be expected to have the highest potential to cause an adverse effect. Therefore, maintenance of wetland hydrology is expected to be the most effective mitigation to sustain these wetland ecosites within the Terrestrial LSA throughout the Project lifespan.

## 5.0 Mitigation Measures

Mitigation measures specific to the wetlands, discussed in the following subsection are applicable during all Operation phases and expected to be effective immediately following implementation and managed through the EMP.

### Disturbance Reduction

- Wherever possible, wetlands will be avoided through Project design and instituting proper buffers.

**DATE:** 19 January 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

- Disturbance to vegetation and soils will be avoided by clearly delineating Project Area boundaries (e.g., with the use of fencing, staking, or flagging), adhering to construction plans and schedules, and by restricting off-site machine use.
- Wetland boundaries in the proximity of planned disturbances will be clearly delineated (e.g., with the use of fencing, staking, or flagging) to facilitate avoidance to the extent practicable.
- Should they occur, areas prone to potential instability and areas in proximity to water bodies and drainage features will be identified and appropriate setbacks will be established and maintained.
- Temporary workspaces or laydown areas will be sited and constructed within existing disturbance or on previously compacted soils, where practicable. In areas requiring clearing only, grubbing will be avoided, and roots and groundcover will be retained to the extent feasible.
- Pre-construction listed plant surveys will be completed within the Project Area.
- Listed plants located adjacent to planned disturbances will be clearly delineated (e.g., with the use of fencing, staking, or flagging) to facilitate avoidance to the extent practicable and reduce the potential for accidental encroachment outside of the Project footprint.
- Should Listed Plants be identified within the Vegetation LSA prior to Construction, site- and species-specific mitigation measures to avoid and/or limit Project effects will be determined by a Qualified Vegetation Ecologist. Specific mitigation measures will depend on the species, its life history characteristics, time of year, and the location of the occurrence in relation to Project activities.
- Herbicide use will be avoided within 100 m of any known listed plant occurrences. Where herbicide use is unavoidable, use will be restricted to direct application instead of broadcast spraying and completed by qualified personnel.

### **Soil Handling and Reclamation**

- Construction activities will be sequenced (i.e., site clearing, grading preparations, major earthworks and construction of infrastructure/facilities) so that surface vegetation, mineral soil and organic matter can be salvaged for later use in Project Decommissioning.
- Soil resources within the Project Area will be stripped/salvaged and stockpiled within the Project Area in accordance with relevant soil management BMPs, i.e., providing guidance on ground-truthing soil conditions, flagging potential hazards and sensitivities, and

**DATE:** 19 January 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

modifying practices in relation to environmental conditions and avoiding or minimizing inadvertent/incidental disturbance.

- A soil monitoring program/protocol (or equivalent) will be undertaken to verify soil salvage volumes and reclamation suitability (Section 9.1.8.2).
- Soil stockpiling locations will be sited to reduce soil handling and travel distances and designed to minimize the potential for soil degradation and downgradient effects, e.g., having defined height and width that optimize soil storage and stockpile stability, and having integrated erosion control measures and surface water management features (if/where necessary). Sediment and erosion control measures will be implemented in accordance with BMPs and commensurate to site conditions and sensitivities.
- Sediment and erosion control measures and surface water management features will be installed and maintained at the Project. Erosion controls (e.g., sediment fencing, check-damns and/or sediment ponds) will be installed as necessary and at the discretion of construction personnel commensurate to site conditions and sensitivities to manage/mitigate erosion and sedimentation.
- Progressive reclamation and ecosystem-based revegetation will be conducted on disturbed areas as soon as practicable with the use of suitable native species and in accordance with the Reclamation and Closure Plan.

### **Surface Water Management**

- Snow melt and runoff will be controlled within the Project Area to prevent the potential release of contaminated runoff from affecting vegetation in adjacent areas.
- Sediment and erosion control measures will be implemented in accordance with the EMS.
- Surface water management features (e.g., culverts and ditches) will be constructed and maintained (as per Project design specification) along access roads and facility sites to facilitate surface drainage continuity and hydrologic connectivity—especially in proximity to wetlands, water crossings, and waterbodies.
- Hydrologic connectivity is expected to be maintained across the Project Area with the engineering, construction, and maintenance of surface water management features (e.g., culverts and ditches) as appropriate and as per Project design specifications along access roads and at facility sites.

**DATE:** 19 January 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

### **Invasive Plant Management**

- Equipment and vehicles will arrive at the Project Area clean, and will be inspected for soil, plant material, and seeds, and cleaned as appropriate, to limit the potential for the introduction of invasive plants and noxious weeds.
- Areas with a high risk for the potential spread of invasive plants and noxious weeds (i.e., within or adjacent to existing infestations) will be avoided to the extent practicable; if work must occur in these areas, invasive plant management will be implemented before starting work.
- Gravel, fill, straw matting, or similar materials to be used for erosion control will be inspected to minimize the potential for seeds or propagules of invasive plants being brought to site.
- All employees and contractors on the Project will receive an employee orientation appropriate to the work they are undertaking, including instruction on the definition of invasive plants and their potential effects, mitigation measures to avoid the introduction and spread of invasive plants, and training on the presence and identification of common invasive plant species and those known to occur within the Project Area.
- Invasive plant monitoring will be conducted periodically by personnel skilled in invasive plant identification during all Project phases to assess, evaluate, and document invasive plant occurrences within the Project Area. Invasive plant surveys will be completed during a biologically appropriate time of year (e.g., when invasive plants can be identified) within areas identified as most susceptible to invasive plant introduction and spread, including roads, ROW, debris and vegetation management areas (e.g., slash piles, timber decks, exposed soil or stockpiles) and other regularly disturbed habitats.
- Three general treatment options may be used alone or in combination to control of invasive plants in the Project Area:
  - mechanical control – involves the physical removal of the plants;
  - chemical control – involves application of synthetic and/or natural herbicides; and,
  - biological control measures – involves use of living organisms (e.g., rusts, insects) to control selected invasive plant species.
- The type of treatment option selected for an invasive plant occurrence will be based on a combination of specific information including the identity of the invasive plant species and its provincial designation, the size and extent of the occurrence, time of year, the proximity of the occurrence to other susceptible areas (e.g., rare plant occurrences, wetlands, waterbodies), and the available control options. Where possible, control of

invasive plants will be completed in consultation with a qualified professional to minimize potential effects on native vegetation, ecosystems and wetlands.

- Seed used during re-vegetation will be certified weed free, with a valid “Certificate of Seed Analysis”.

## 6.0 Residual Effects Evaluation

### 6.1 Residual Effects Characterization

Residual effects on the Vegetation and Ecosystems, Listed Plant Species, and Wetlands VCs have been assessed in relation to the RSA, and characterized in terms of direction, magnitude, geographic extent, frequency, duration, reversibility, context, and likelihood (**Error! Reference source not found.** 6). Residual effect evaluation of residual effects are provided in Tables 7, 8 and 9.

**Table 6: Definitions of Effect Characteristics Considered When Determining the Significance of Residual Effects**

Residual Effect Characteristic	Definition	Rating
Direction	Identifies whether the residual effect will be adverse or positive.	<p><b>Adverse</b> – Negative effect or effect is not desirable.</p> <p><i>Water Quantity</i> – Effect moves MPs (flow or water level) in a direction detrimental to water quantity relative to baseline conditions. A Project-related increase in surface water flows and levels during flooding, or a decrease in surface water flow below environmental flow requirements.</p> <p><i>Water Quality</i> – An increase in constituent concentrations attributable to the Project in comparison to baseline conditions and trends.</p> <p><i>Wetlands / Fish Habitat</i> – A physical loss of available fish habitat (extent of area) in comparison to baseline conditions.</p> <p><b>Positive</b> – Beneficial effect or effect is desirable.</p>
Magnitude	The amount of change in a measurable parameter relative to baseline conditions.	<p><b>Low</b></p> <ul style="list-style-type: none"> <li>▪ measurable decrease in the spatial extent of Wetlands, but less than a 10% loss; all original wetland classes are present.</li> <li>▪ A measurable change that is not within the variability of baseline conditions but below relevant water quality objectives and criteria. A Project-related change in hydrology (flows or levels) compared to baseline conditions, but where the change is &lt;5% from baseline conditions</li> </ul>

DATE: 19 January 2024

TO: Denison Mines – Janna Switzer

REF: Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

Residual Effect Characteristic	Definition	Rating
		<p><b>Moderate</b></p> <ul style="list-style-type: none"><li>▪ measurable decrease in the spatial extent of Wetlands between 10% and 30% loss; measurable changes in the diversity of wetland classes; some original wetland classes may be absent.</li><li>▪ A measurable change in water quality that is not within the variability of baseline conditions and not within applicable guidelines, legislated requirements, and/or federal and provincial management objectives. A Project-related change in hydrology (flows or levels) compared to baseline conditions, but where the change is &gt;5% from baseline conditions, and could, therefore, have an adverse effect on Fish and Fish Habitat within the LSA.</li></ul> <p><b>High</b></p> <ul style="list-style-type: none"><li>▪ measurable decrease in the spatial extent of Wetlands greater than 30% loss; some original wetland classes are absent.</li><li>▪ monthly flows (&gt;10%), or lake surface elevation (m) in a waterbody or watercourse that is greater than the range of natural variability and large enough that fish can no longer rely on this habitat to carry out one or more of their life processes. A measurable change in water quality that is not within the variability of baseline conditions and not within applicable guidelines, legislated requirements, and/or federal and provincial management objectives and is likely to have an adverse effect on Wetlands (Fish and Fish Habitat) within the LSA, with the effect extending beyond the LSA.</li></ul>
Geographic Extent	The geographic area within which the residual effect is expected to occur.	<p><b>Project Area</b> – Effect is limited to the Project Area.</p> <p><b>Local</b> – Effect is limited to the Vegetation LSA.</p> <p><b>Regional</b> – Effect extends beyond the Vegetation LSA into the Terrestrial RSA.</p> <p><b>Beyond Regional</b> – Effect extends beyond the Terrestrial RSA.</p>
Duration	Length of time over which the residual effect is expected to persist.	<p><b>Short-term</b> – Less than 3 years (i.e., effect happens during Construction only).</p> <p><b>Medium-term</b> – 3 years to 38 years (i.e., effect happens from Construction through to the end of Post-Decommissioning).</p> <p><b>Long-term</b> – More than 38 years (i.e., effect extends beyond Post-Decommissioning).</p>
Frequency	How often the residual effect is expected to occur.	<p><b>Infrequent</b> – Effect occurs several times at sporadic intervals.</p> <p><b>Frequent</b> – Effect occurs many times on a regular basis.</p> <p><b>Continuous</b> – Effect occurs continuously.</p>

DATE: 19 January 2024

TO: Denison Mines – Janna Switzer

REF: Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

Residual Effect Characteristic	Definition	Rating
Reversibility	Whether or not the residual effect can be reversed once the activity causing the residual effect ceases.	<b>Fully Reversible</b> – A residual effect that diminishes to baseline conditions. <b>Partially Reversible</b> – A residual effect that partially diminishes to baseline conditions. <b>Irreversible</b> – A residual effect that will not diminish to baseline conditions.
Context	The extent to which the VC or KI has been affected by past and present environmental and socio-economic processes and conditions, its potential sensitivity to the Project-related residual effect, and its ability to recover from that effect (i.e., resilience)	<b>Low</b> – VC/KI has high resilience to stress or ecological change. This resilience can be a result of the ecological characteristics of the species or ecosystem, and/or a lack of historic and ongoing anthropogenic or natural disturbance. No listed species present. <b>Moderate</b> – VC/KI has moderate resilience to stress or ecological change. This resilience can be a result of the ecological characteristics of the species or ecosystem, and/or an intermediate level of historic or ongoing anthropogenic or natural disturbance with the capacity to assimilate more change. Presence of listed species <b>High</b> – VC/KI has weak resilience to stress or ecological change. This resilience can be a result of the ecological characteristics of the species or ecosystem, and/or a high level of historic or ongoing anthropogenic or natural disturbance. Presence of SARA-listed species
Likelihood	Likelihood that the residual effect will occur including consideration of the likelihood that the mitigation will be successful.	<b>Likely</b> – A moderate to high probability that the residual effect will occur. <b>Unlikely</b> – A low probability that the residual effect will occur.

**DATE:** 19 January 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

**Table 7: Wetland Fish and Fish Habitat – Summary of the Residual Effect Characteristics for Surface Water Quality**

Residual Effect Characteristic	Rating	Summary Rationale for Rating
Direction	Adverse	The Project (specifically the discharge of effluent to the natural environment) will cause a change in the concentration of constituents, as measured as a mass of a chemical per unit volume in water (e.g., mg/L). Surface water quality in the local receiving environment will be adversely affected by effluent discharge to the aquatic environment, thereby providing a pathway to adversely affect surface waters. However, no discharge is planned to wetlands outside of Whitefish Lake.
Magnitude	Low	The magnitude of the residual effect is predicted to be low as constituents that may be introduced as part of Project activities are expected to remain below criteria for the protection of aquatic life and human health.
Geographic Extent	Local	The geographic extent of the residual effect is predicted to be confined to the immediate waterbody adjacent to the Project (i.e., Whitefish Lake). The estimated mixing zone is less than 5 m, implementing an effluent discharge configuration that promotes mixing.
Duration	Long-term	The residual effect is expected to last between 3 to 38 years (i.e., effect expected during Construction through to the end of Post-Decommissioning).
Frequency	Continuous	For the purposes of this EIS, a conservative scenario was identified, with effluent discharge being considered as continuous during Operation and Decommissioning.
Reversibility	Fully reversible	Surface water quality is expected to return to pre-development levels following Post-Decommissioning as Project-related sources will cease to operate.
Context	Low	Wetland health is expected to be resilient to changes in surface water quality in the context of this assessment, as COPC meet protective criteria even at the extreme low water scenario. Therefore, under applicable mitigative measures and average flow conditions, the contextual resilience of the aquatic system to respond to change is considered to be great.
Likelihood	Likely	A high probability exists that a change in water quality from background conditions will occur, but be restricted to Whitefish Lake and not other surrounding wetland features.

REF: Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

**Table 8: Wetland Fish and Fish Habitat – Summary of the Residual Effect Characteristics for Change in Area Extent**

Residual Effect Characteristic	Rating	Summary Rationale for Rating
Direction	Adverse	Impacts to wetlands in the LSA from physical disturbance or overprinting are expected to be minor in nature and relegated to wetlands located at stream crossings for access roads and the hydro-line corridor. In both cases the approach to design will be one of avoidance and minimal disturbance with clear span bridges and minimal clearing required for hydro-line installation where avoidance of open water areas can be met.
Magnitude	Low	The magnitude of the residual effect is predicted to be low. Less than 0.1% of Wetlands within the Terrestrial RSA are predicted to be directly affected as a result of Project Construction, and up to 1.5% may be indirectly affected during all Project phases.
Geographic Extent	Local	The residual effect is expected to be limited to the LSA, specifically to wetlands located at stream crossings for access roads and the hydro-line corridor
Duration	Long-term	Once natural drainage patterns are re-established following Operation, the structure and function of Wetlands altered as a result of indirect Project effects are expected to re-establish after Post-Decommissioning (more than 38 years).
Frequency	Frequent	While direct affects to specific Wetlands will occur over a short time period during Construction, Wetland alteration by indirect effects is anticipated to occur frequently throughout Construction, Operation, and Decommissioning, and infrequently during Post-Decommissioning.
Reversibility	Partially Reversible	Wetland effects are predicted to be partially reversible during Decommissioning once natural hydrologic conditions are reinstated. Alterations to wetland extent, structure and/or function as a result of indirect Project effects during all Project phases are predicted to be reversible over time once natural hydrologic conditions are reinstated and edge effects, dust, water quality changes, and invasive plant propagule pressure are reduced at the end of Decommissioning.
Context	Moderate	Wetlands can exhibit low resilience and high susceptibility to disturbance; however, disturbance is common within the Terrestrial RSA, and existing Wetlands have been historically disturbed by access roads and exploration activities.
Likelihood	Likely	The infrastructure associated with the bridges and the hydro-line are likely to affect the localized area for which they span in a limited way.

DATE: 19 January 2024

TO: Denison Mines – Janna Switzer

REF: Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

**Table 9: Wetland Fish and Fish Habitat – Summary of the Residual Effect Characteristics for Change in Surface Water Quantity (Hydrology)**

Residual Effect Characteristic	Rating	Summary Rationale for Rating
Direction	Adverse	Water quantity (flow and level) will be reduced in LA-5 as a result of the overprinting of its reporting drainage area by mine infrastructure and through site water balance. Water taking has an additional potential to reduce water levels in LA-5 and associated wetlands.
Magnitude	Low	The magnitude of the residual effect is predicted to be low. Under all scenarios, the Project-related change in hydrology (flows or levels) compared to baseline conditions is less than 5% of baseline conditions, and generally less than 3%.
Geographic Extent	Local	The residual effect is expected to be limited to the LSA, specifically the lakes and wetlands within proximity to the Project site (i.e., LA-5, LA-6, and LA-1).
Duration	Moderate	The residual effect is expected to last between 3 to 38 years (i.e., effect expected during Construction through to the end of Post-Decommissioning).
Frequency	Continuously	Although the mine is unlikely to require water taking on a continuous basis, this has been assessed as a bounding scenario and, as such, must be considered as a continuous effect.
Reversibility	Fully reversible	Surface water hydrology is expected to return to pre-development levels following Post-Decommissioning.
Context	Moderate	Surface water flow regimes are variable, and it is this variability that provides for morphological form to be maintained and for ecological reliance (i.e., wetlands, fish habitat). Some change to environmental flows is tolerated by wetland biota.
Likelihood	Low	Due to the localized nature and low magnitude of the effect on surface water hydrology, the likelihood of an effect is considered to be very low; therefore, the likelihood of an effect on Wetlands is expected to be low.

## 6.2 Significance and Confidence

The residual effect of change in the areal extent of the Wetlands VC as a result of the Project is not expected to result in a change to the wetlands KI that will alter its integrity within the Terrestrial RSA to the point where it is not sustainable or unavailable to contribute to ecological functions.

The threshold for significance for the Wetlands VC relates to predicted changes in the concentrations of water quality parameters, where changes could result in exceedances of

**DATE:** 19 January 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

relevant water quality benchmarks that are protective of aquatic biota in waterbodies that receive mine-affected drainage. The threshold for significance for Wetlands also includes predicted changes in surface water flows greater than baseline environmental flows and direct habitat loss.

The significance of the residual effects on the Wetlands VC has been deemed **not significant**. Following mitigation, the residual effects are not expected to cause a change in Wetland habitat (or associated KIs) to the extent that they might alter the ecological integrity of the VC in the LSA beyond an acceptable level.

The predicted confidence with respect to the Wetlands VC is high as the mobilization of suspended materials can be readily mitigated, making the effects prediction relative to this effect pathway easily understood.

Confidence in the assessment of predicted effects on water levels or flow is quite high due to available hydrological data for the LSA. Uncertainty is minimal with the assumptions that the water withdrawal and discharge scenarios presented herein represent the bounding case, and hydrogeological modelling projections are not changed (Section 8.1 of the EIS).

Potential effects on water quality as a result of Project discharges to local receiving environments were assessed by way of numerical modeling. These predictions are generally considered conservative in nature because the assumptions on which they are based are conservative. For example:

- The assessment is based on a continuous (year-round) discharge at an expected average effluent rate of 0.0101 m<sup>3</sup>/s (36.5 m<sup>3</sup>/hr) throughout Construction, Operation, and Decommissioning, despite the likelihood that effluent discharge will not be continuous and will only discharge when site water balance requires, based on water storage capabilities.
- The constituents in effluent discharge have been estimated conservatively. Presented discharge concentrations provided herein include contingency factors of one to three times.
- Baseline water quality is defined by the 95th percentile concentrations of individual constituents. Such an assumption is conservative as it constrains the assimilative capacity associated with the receiving environment. By definition, the assimilative capacity of a receiving environment is equal to the incremental difference between the existing baseline condition and the assessment benchmark (i.e., water quality criterion) on which the evaluation is based. Use of the 95th percentile concentration, rather than a measure

DATE: 19 January 2024

TO: Denison Mines – Janna Switzer

REF: Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

of central tendency (i.e., 50th percentile, geomean), means that the incremental change in a given constituent concentration that can be assimilated by the receiving environment (whereby use of the receiving environment is protected) is relatively small in magnitude.

Due to the conservative nature of the assumptions on which the numerical assumptions are based, a high degree of confidence can be assumed.

### 6.3 Summary of Project Related Residual Adverse Effects

The results of the characterizations for these residual effects are summarized in Table 10. The residual effects of the Project on the Wetland KIs were predicted to be **not significant**. Thus, the residual effects of the Project on the Wetlands VC are predicted to be **not significant**.

**Table 10: Summary of Project-related Residual Effects**

Valued Component	Residual Effect	Project Phase	Direction	Magnitude	Geographic Extent	Duration	Frequency	Reversibility	Context	Likelihood	Significance
Wetlands	Change in Water Quality	C, O, D	A	L	L	LT	C	FR	L	L	NS
	Change in Water Level or Flow	C, O, D	A	L	L	MT	C	FR	L	L	NS
	Change in the Areal Extent of Wetlands	C, O, D	A	L	L	LT	F	PR	M	L	NS

- <sup>1</sup> Direction: Adverse (A), Positive (P)
- Magnitude: Low (L), Moderate (M), High (H)
- Geographic Extent: Local (L), Regional (R), Beyond Regional (BR)
- Duration: Short-term (ST), Medium-term (MT), Long-term (LT)
- Frequency: Infrequent (IF), Frequent (F), Continuous (C)
- Reversibility: Fully Reversible (FR), Partially Reversible (PR), Irreversible (IR)
- Context: Low (L), Moderate (M), High (H)
- Likelihood: Unlikely (U), Likely (L)
- Significance: Not-Significant (NS), Significant (S)
- Level of Confidence: High (H), Moderate (M), Low (L)

DATE: 19 January 2024

TO: Denison Mines – Janna Switzer

REF: Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

## 7.0 Cumulative Effects

The cumulative effects are discussed in detail in Section 9.2.7 of the EIS and are not re-examined herein.

## 8.0 Summary

Bogs are predicted to be the wetland class most affected by the Project, with 0.4 ha (less than 0.1%) of mapped bog ecosystems within the Terrestrial RSA expected to be disturbed within the Project Area during Construction. Fens are the next most affected, with 0.1 ha (0.1%) anticipated to be disturbed during Construction. Less than 0.1 ha (less than 0.1%) of shallow open water wetlands within the Terrestrial RSA are also anticipated to be affected by the Project.

Within these wetland classes, the wetland ecosite expected to be most affected is the willow shrubby rich fen (ecosite BS23) with direct disturbance to 0.1 ha predicted to occur within the Project Area (0.5% of the BS23 ecosite within the Terrestrial RSA). The remaining ecosites anticipated to be directly affected by the Project are locally abundant, with direct disturbance expected to affect <0.1% of these ecosites within the Terrestrial RSA.

Investigation of the potential overprinting of wetland features as a result of the Project it is evident that wetland loss is avoidable. The interaction of the Project with wetlands is relegated to those areas where stream crossings for access roads and hydro-line connections are proposed.

Avoidance through design as well as mitigation measures to control sedimentation to wetland features during construction, operation and decommissioning phases. Water quantity and quality are not expected to cause impacts to wetlands as the change in surface water feature levels and flow are nearly negligible and water will not be discharged to wetlands save for Whitefish Lake, for which effluent will not be released unless meeting criteria for the protection of aquatic life.

Residual effects on the Wetlands VC resulting from the Project were identified and assessed as **not significant**. Existing provincial legislation (Environmental Management and Protection Act [Government of Saskatchewan 2010] and the Water Security Agency Act [Government of Saskatchewan 2019b]) requires written approval (i.e., Aquatic Habitat Protection Permits) prior to any works within a wetland.

To further supplement existing information that exists for the LSA wetlands, Denison is committed to undertaking wetland surveys including the collection of water quality, sediment quality, benthic invertebrates and fish and fish habitat surveys prior to the construction of the operation to provide an updated baseline for assessing the success of mitigation measures and

**DATE:** 19 January 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

to assess potential effects of the project on wetlands. These locations will then be further considered as part of the EMP for continued monitoring for these media and biota.

## **Attachment IR-101 (Round 4)**

### **Kds**

As outlined in Section 2.2 of the IMPACT Model Report (Appendix A to Appendix 10-A), as constituents travel through a series of connected waterbodies such as lakes, concentrations in water can decrease as a result of mixing with natural inflows from the surrounding watershed and interactions with lake sediment. The sediment-water exchange of constituents is estimated using chemical-specific partitioning coefficients (Kds). The Kd describes the relationship between the concentration of a constituent in the solid (in this case sediment) and the aqueous phases (in this case surface water) for a system that is at equilibrium.

The sediment-water partitioning coefficients are based on regional data which includes the following:

- Environmental baseline studies at Key Lake from 1976 to 1978 which were presented in the Key Lake EIS (KLMC, 1979), including additional baseline data collected in 1982 (IES, 1983a,b), and 1999 (Conor Pacific, 2000). Since operations began in 1983 ongoing environmental monitoring data has been collected
- Environmental baseline studies at McArthur River from 1992 to 1994 (EMA, 1992; TAEM, 1993a,b; Golder 1994a,b) to support the 1995 EIS (Cameco, 1996). Since operations began in 2000 ongoing environmental monitoring data has been collected
- Environmental baseline studies for the proposed Millennium mine from 2006 to 2008 from Moon Lake, Slush Lake, Lake A, Lake B, and Lake C.

Monitoring data of this sort that can be used to derive Kds are particularly valuable. As noted above, in this context Kd describes the relationship between the concentration of a constituent in sediment and surface water. In order to define a reliable and predictive relationship there must be sufficient distribution of sediment and surface water quality and a relatively wide range. The data collected in the studies referenced above not only have regional relevance but include data collected under true baseline conditions (pre-operational conditions), operational conditions in areas the receive mill/mine effluents and reference areas during operational conditions that are uninfluenced by mill/mine effluents but provided a time series of data collected over time. Together these data meet the test of having sufficient distribution of sediment and surface water quality that are wide ranging and support Kd development. This is in contrast to developing Kds with baseline data only where many constituents in water and sediment are at or below laboratory detection and/or are not wide distributed enough to develop a predictive relationship.

The background water and sediment quality observed for Key Lake, McArthur River, and Millennium is shown on Figure IR-101-1 and Figure IR-101-2 below. Regional sediment to water partitioning coefficients were estimated through model calibration and comparison to literature values. Measured water and sediment concentrations were compared to approximate a Kd, and then further refined to achieve a best estimate of water and sediment concentrations. Limitations were found when data were below the detection limit. Kds have been refined over time when better detection limits were achieved in monitoring data (e.g., Pb-210 and Po-210 in 2015 based on McArthur River data). The sediment-water partitioning coefficients were applied to the

Wheeler River Project, and are shown in Table IR-101-1 below (Table 3-6 in the ERA Appendix 10-A). The source of the Kd has been added to the table.

When comparing the water and sediment quality data in Figure IR-101-1 and Figure IR-101-2 to the Wheeler River baseline data, the Wheeler River baseline data falls within the spread of the regional data used since the 1970s. The exception is where improved detection limits have been achieved, showing lower water quality data. Plots of the baseline water quality data that were provided in Appendix A of the ERA in Appendix 10-A are reproduced below for ease of comparison. A few examples are described below:

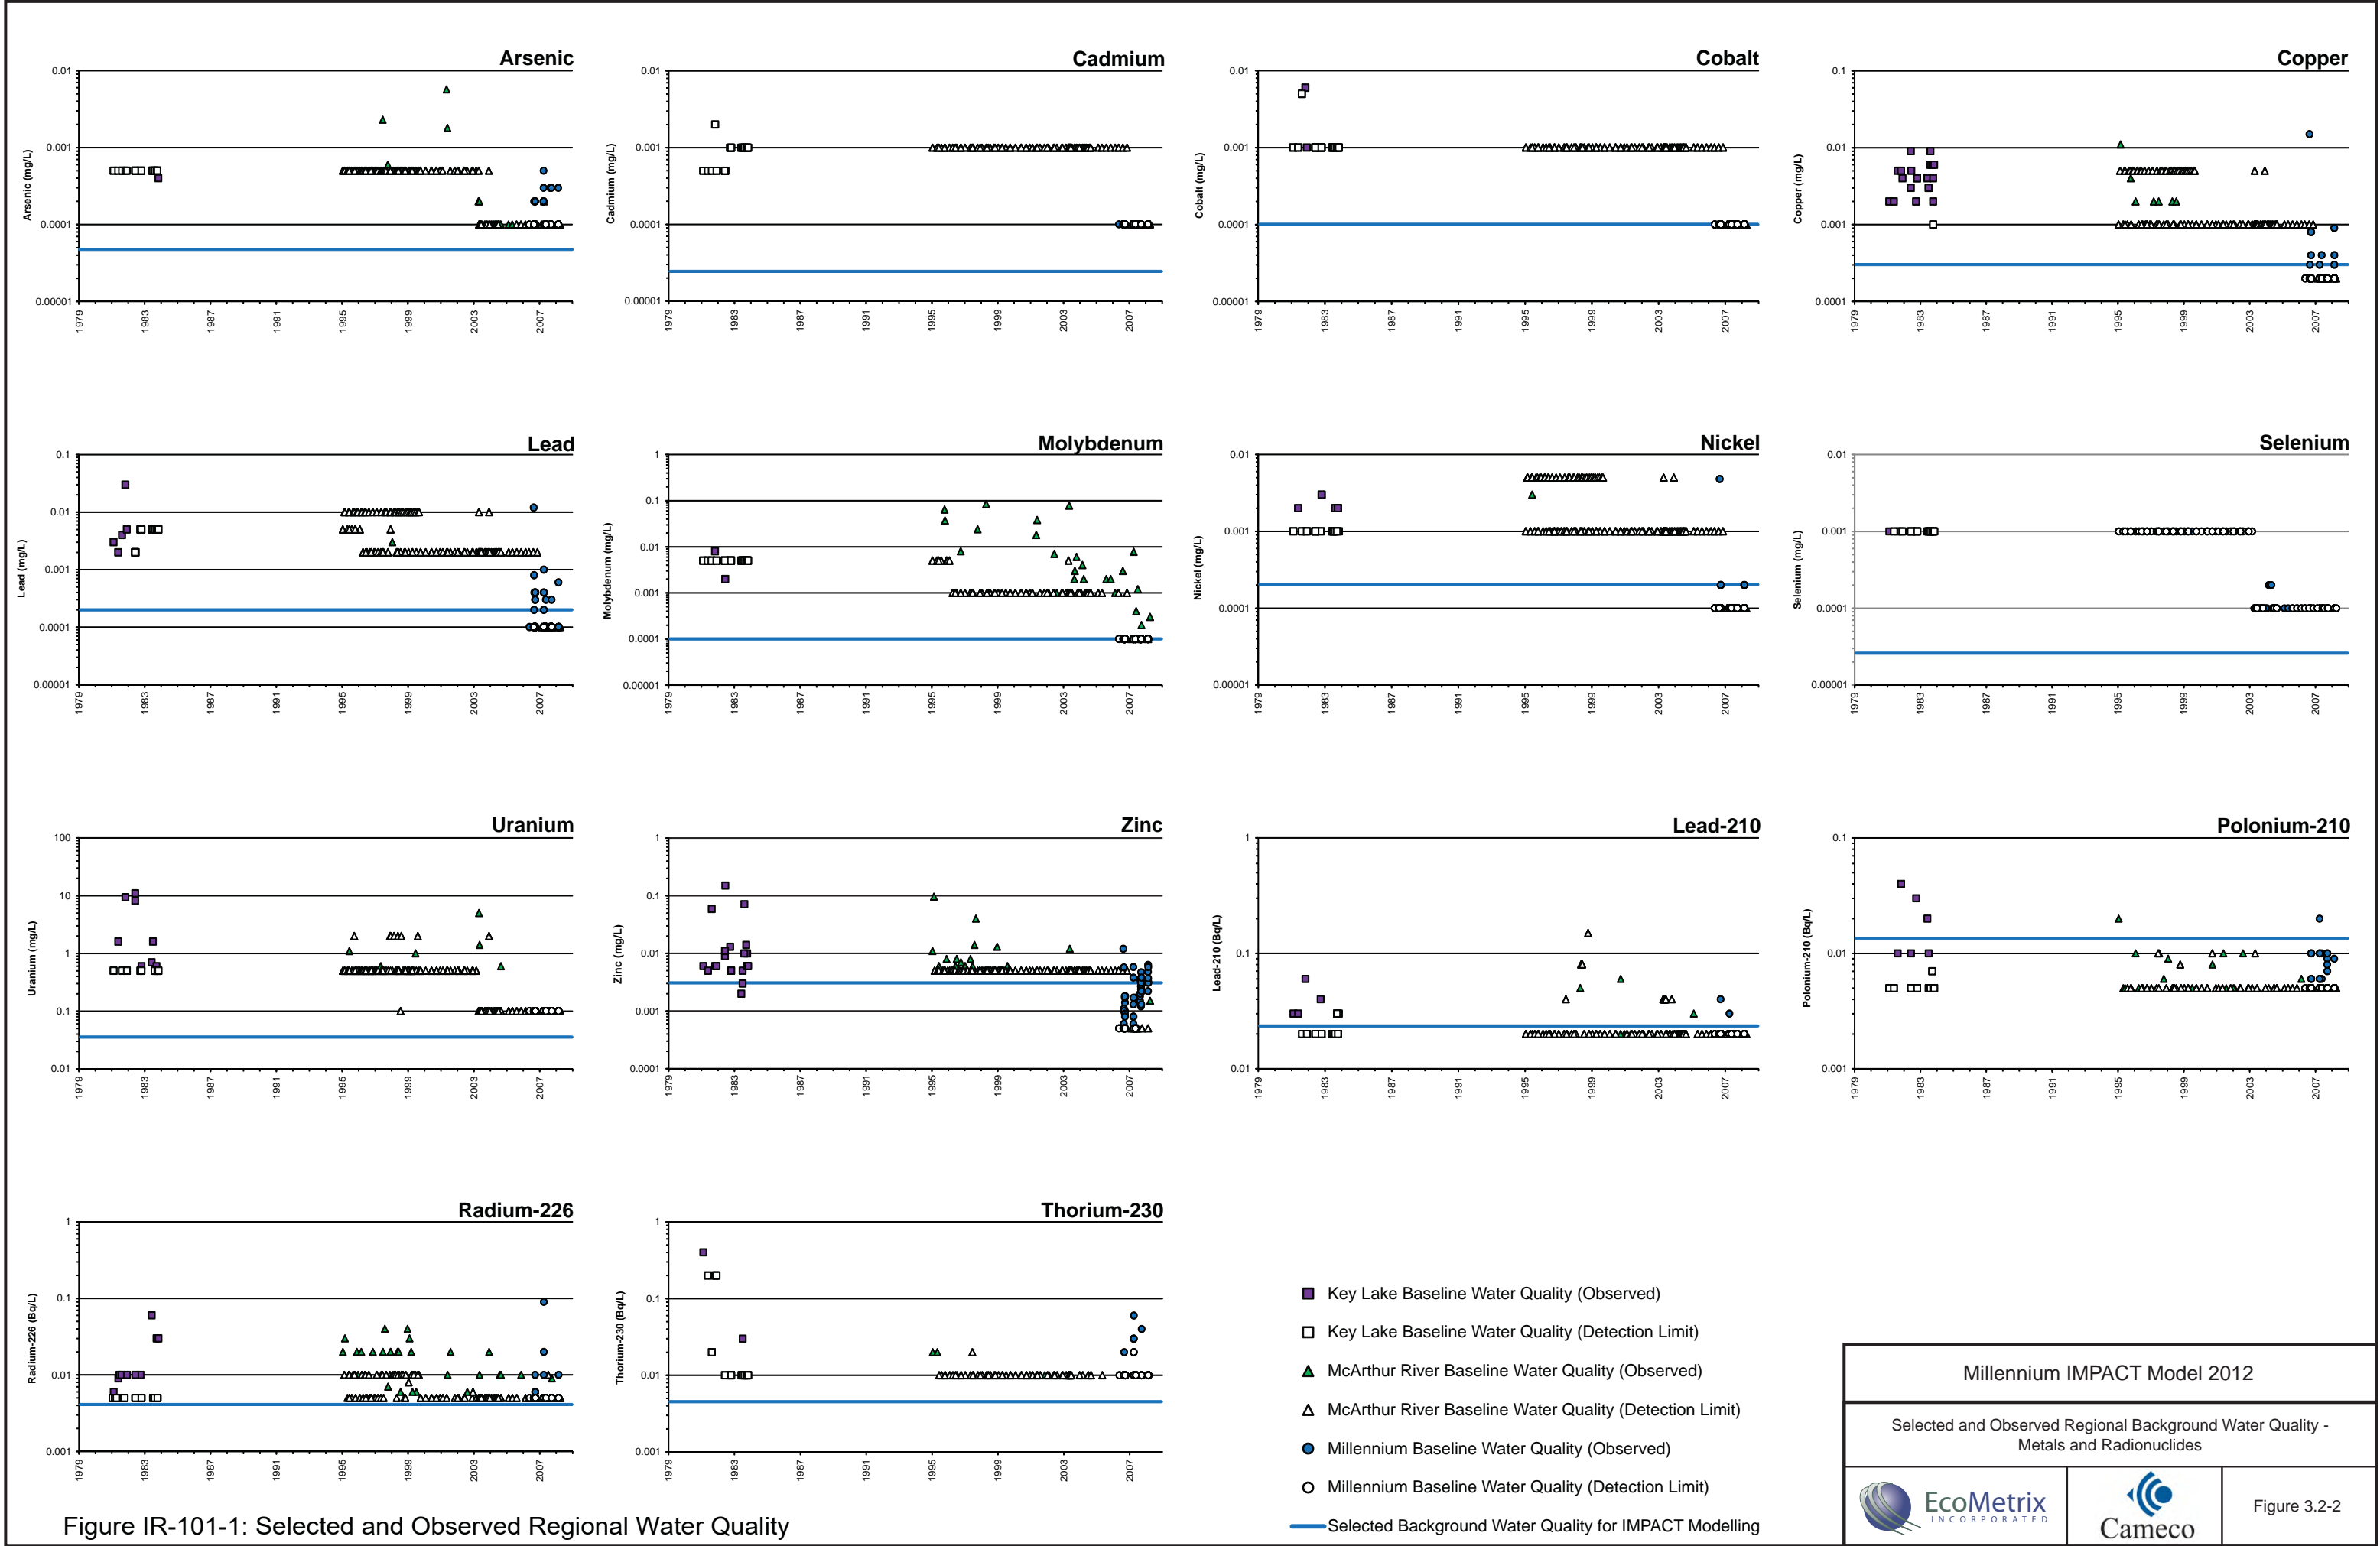

- Arsenic:
  - The regional data ranges from 0.0001 mg/L to 0.01 mg/L in water and 0.2 mg/kg to 11 mg/kg in sediment.
  - The Wheeler River data ranges from 0.0001 mg/L to 0.0003 mg/L in water and 0.4 mg/kg to 7.2 mg/kg in sediment.
- Cadmium
  - The regional data ranges from 0.0001 mg/L to 0.001 mg/L in water and 0.2 mg/kg to 10.5 mg/kg in sediment.
  - The Wheeler River data ranges from 0.00001 mg/L to 0.00007 mg/L in water and 0.1 mg/kg to 0.7 mg/kg in sediment.
  - The difference in water is related to improved detection limits in the Wheeler River baseline data compared to the regional data
- Copper
  - The regional data ranges from 0.0002 mg/L to 0.02 mg/L in water and 0.5 mg/kg to 11 mg/kg in sediment.
  - The Wheeler River data ranges from 0.0002 mg/L to 0.0008 mg/L in water and 0.5 mg/kg to 8.4 mg/kg in sediment.
- Selenium
  - The regional data ranges from 0.0001 mg/L to 0.001 mg/L in water and 0.008 mg/kg to 9 mg/kg in sediment.
  - The Wheeler River data ranges from 0.0001 mg/L to 0.0002 mg/L in water and 0.1 mg/kg to 1.8 mg/kg in sediment.

As the Wheeler River Project progresses through the licensing process, additional baseline data will be collected. The water and sediment data will continue to be validated against the regional Kds, to determine if the data are within the spread of the regional dataset, or if changes to the Kds are warranted.

**Table IR-101-1: Distribution Coefficients ( $K_d$ ) Used in the IMPACT Model**

COPC	Distribution Coefficient	Source
	L/kg (dw)	
Arsenic	9.64E+04	Millennium (Ecometrix, 2013)
Cadmium	1.50E+04	Millennium (Ecometrix, 2013)
Chromium	1.16E+04	Calibrated for Wheeler River
Cobalt	2.50E+03	Millennium (Ecometrix, 2013)
Copper	3.00E+03	Millennium (Ecometrix, 2013)
Molybdenum	3.17E+03	Millennium (Ecometrix, 2013)
Selenium	2.00E+04	Millennium (Ecometrix, 2013)
Uranium	2.00E+04	Millennium (Ecometrix, 2013)

Uranium-234	2.00E+04	Millennium (Ecometrix, 2013)
Uranium-238	2.00E+04	Millennium (Ecometrix, 2013)

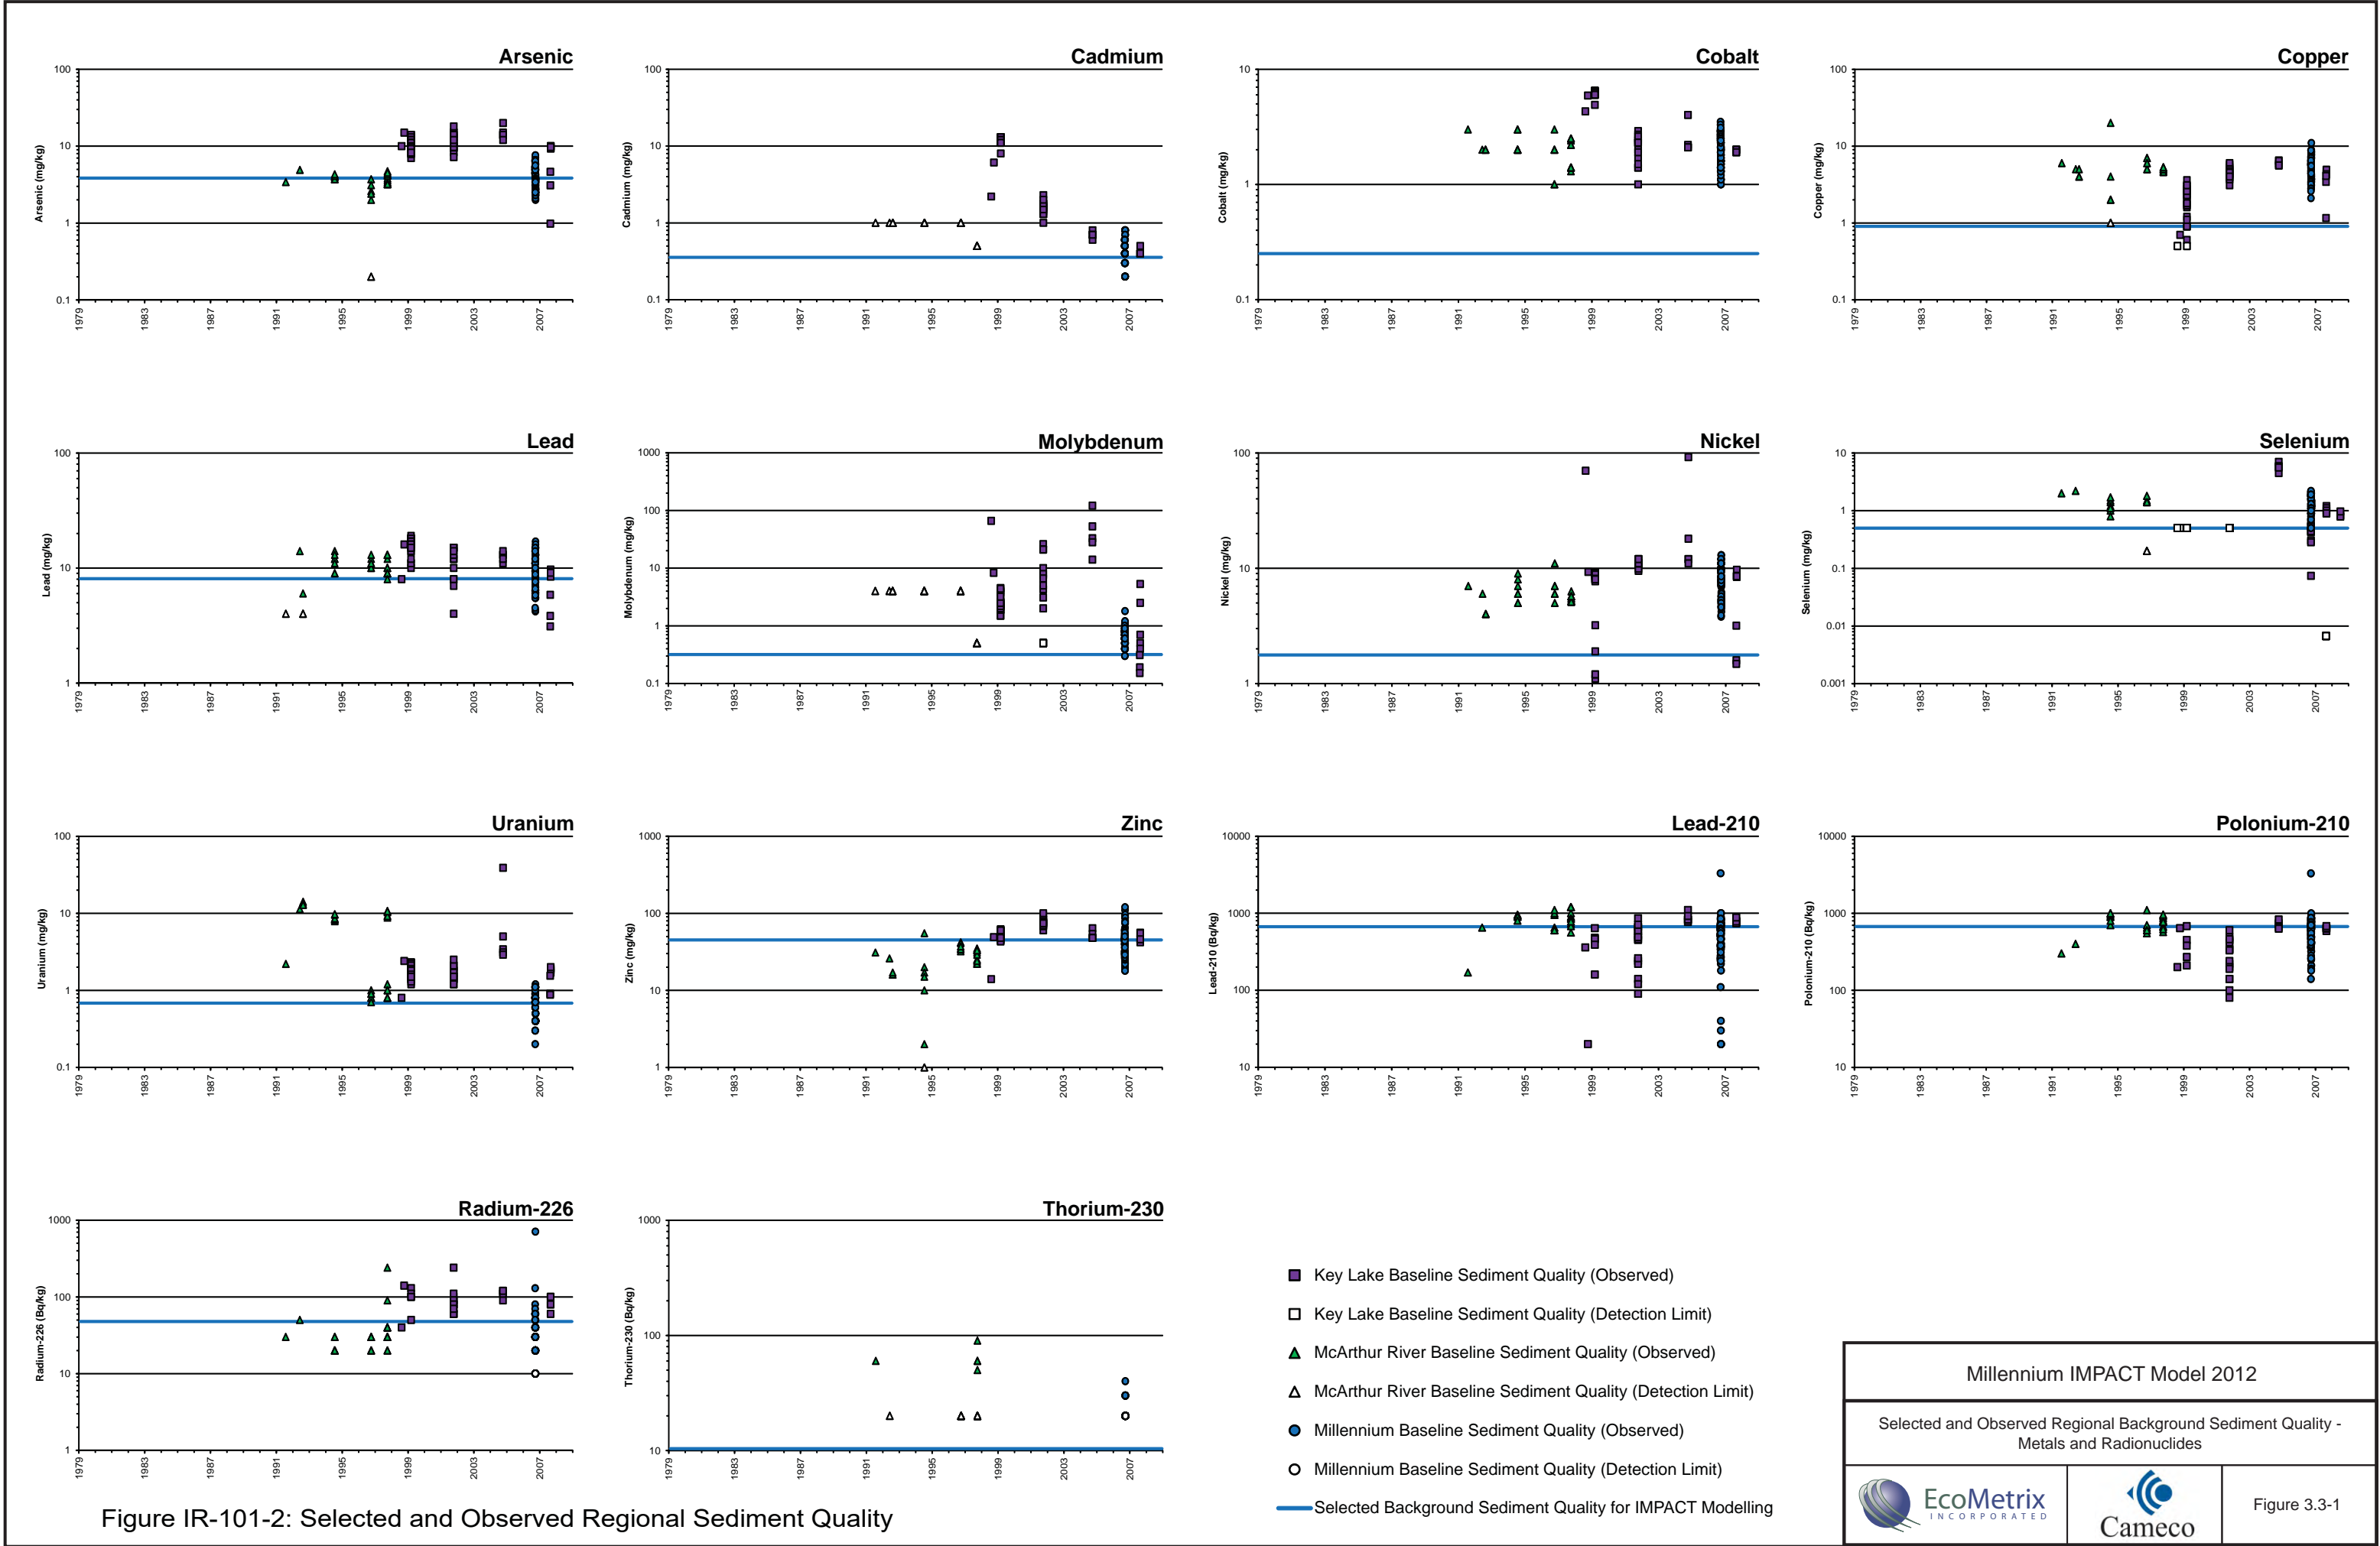

Figure IR-101-2: Selected and Observed Regional Sediment Quality

Figure IR-101-3: Selected and Observed Wheeler River Water Quality

Figure IR-101-4: Selected and Observed Wheeler River Sediment Quality

## Grain Size

EIS Section 8.4.3.2.1 states that grain size in the top 0-2 cm of sediment was predominantly clay-size fractions followed by silt (Whitefish Lake North, McGowan Lake, and Russell Lake). In Whitefish Lake South, grain size was predominantly clay, followed by sand and then silt. Data from the Key Lake Operation, located 35 km southwest of the Project, and McArthur River Operation, located 35 km northeast of the Project, were used as part of regional data for the Wheeler River Project. Based on the 2015 Environmental Performance Report (EPR) for the Key Lake Operation, sediment grain size in the top 0-2 cm, was predominantly silt followed by clay, and a small amount of sand (Figure IR-101-1). Based on the 2015 EPR for the McArthur River Operation, sediment grain size in the top 0-2 cm was predominantly silt and clay, followed by sand (Figure IR-101-2).

**Figure IR-107-1: Grain Size Distribution in Shallow Areas in David Creek Drainage (Ecometrix, 2015a)**

**Figure IR-107-2: Grain Size Distribution in Shallow Areas in Reference and Exposure Sediment in McArthur River Operation Area (Ecometrix, 2015b)**

## 1.0 Introduction

On October 21, 2022, Denison Mines Corp. (Denison) submitted a draft Environmental Impact Statement (EIS) for the proposed Wheeler River Project (the Project). Based on their initial review, the Canadian Nuclear Safety Commission indicated that the submission contained the required information to proceed with the Federal-Indigenous Review Team (FIRT) technical review of the draft EIS. On March 20, 2023, the FIRT provided Denison with a list of information requests (IRs) for Denison to respond to and eventually submit a final EIS document. Responses to these IRs were provided in July and August of 2023. Additional FIRT IRs were provided to Denison on December 5, 2024. Of these IR-101 was not adequately answered and additional information was requested. [This appendix was initially included in the January 2024 revised draft EIS and has been updated in October 2024 in response to Round 4 IR-101.](#)

This appendix provides additional information to address IR-101 provided by Environment Canada and Climate Change (ECCC) as part of the second [and fourth](#) round of FIRT comments. The comment included a request for a further summary of wetland characterization information from available sources, baseline information pertaining to water quality and sediment quality, and assessment of potential effects to wetlands within the LSA for all phases of the Project and provide further information on mitigation measures and monitoring that would be applied for the protection of wetlands.

## 2.0 Scope of the Assessment

This section addresses the potential effects of the Project on the Fish and Fish Habitat VC for which wetland habitats are considered a component. The purpose of this assessment is to assess potential changes to wetlands (as represented by the Fish and Fish Habitat VC) in consideration of all phases of the Project at the Project Area, local, and regional study area scales. Pathways affecting wetlands are directly associated with potential changes to the Surface Water Quantity (hydrology), Surface Water Quality, Sediment Quality, and Benthic Invertebrates VCs. Changes to

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

hydrology, water quality, sediment quality, and benthic invertebrate communities may directly affect wetlands as both fish and wildlife habitat and food resources. The assessment approach reflects these connections within the environment, as the significance determination for the Surface Water Quantity and Surface Water Quality VCs was conducted at the receptor VC level.

The Vegetation and Ecosystems, Listed Plant Species, and Wetlands VCs are interrelated, to varying extents, and are linked to other VCs, including:

Surface Water Quality – surface water contributes to local moisture regimes, and surface water quality can influence the persistence of Vegetation and Ecosystems, Listed Plant Species, and Wetlands.

Surface Water Quantity – surface water contributes to local moisture regimes, and surface water quantity contributes to site drainage and discharge, which can influence the persistence of Vegetation and Ecosystems, Listed Plant Species, and Wetlands.

Sediment Quality – Vegetation and Ecosystems, Listed Plant Species, and Wetlands contribute to ecosystem form and function that stabilize riparian areas and influence quality of surface water runoff to aquatic systems.

This appendix will focus on the interrelations between these VCs as they apply to Wetland function.

Pathways that are of interest include those associated with site clearing and the potential for erosion-driven mobilization of suspended sediment into local surface waters; groundwater interactions with surface water features including wetlands; the establishment of new subwatershed boundaries and the resulting effects of effluent discharge to the receiving environment; and the potential overprinting of wetland habitat by Project infrastructure.

## 2.1 Key indicators and Measurable Parameters

The KIs for the wetland component of the Fish and Fish Habitat VC include potential changes in surface water quantity, surface water quality, and available wetland habitat from baseline conditions. The rationale for each KI and associated MPs is summarized in Table 1.

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

**Table 1: Key Indicators and Measurable Parameters for the Wetlands Valued Component**

Key Indicator	Rationale for Key Indicator	Measurable Parameter
Change in available wetland habitat from baseline conditions	<ul style="list-style-type: none"><li>Project activities may result in a change in the extent of Wetlands.</li><li>Of provincial and federal management concern</li><li>Contributes to biodiversity and habitat for wildlife species and listed plant species.</li><li>Cultural importance.</li><li>Contributes to biodiversity, maintenance of hydrologic cycles, nutrient cycling, water quality, and carbon storage.</li><li>Sensitive to disturbance.</li><li>Historically addressed for other mining projects in northern Saskatchewan.</li></ul>	Aerial extent (m <sup>2</sup> or ha) of overprinted wetland habitat.
Change to water levels or flows from baseline conditions	Project activities are expected to result in changes to local hydrology. A reduction or increase in flows may result due to the elimination or redirection of subwatershed area and through Project water management (i.e., water taking, storage, and effluent discharge). These changes in flow to the environment may alter stream flows, lake levels and such feature interactions (inundation) with wetland features required for fish and wildlife during all life stages.	Changes in water levels (m) or percent changes to flow conditions (%).
Change in surface water quality from baseline conditions	Changes in water quality are regulated (subsection 36(1) of the <i>Fisheries Act</i> and the MDMER). Changes that may occur as a result of the Project include: <ul style="list-style-type: none"><li>mobilization of solids into local watersheds; and</li><li>deposition of deleterious substances into the receiving environment as a result of mine effluent and/or surface runoff.</li></ul>	Change in the concentration of constituents that are directly related to Project activities, measured as a mass of a chemical per unit volume in water (e.g., mg/L).

## 2.2 Spatial and Temporal Boundaries

The areas used to assess the effects of the Project on the Vegetation and Ecosystems, Listed Plant Species, and Wetlands VCs are (Figure 1):

**Project Area:** the area within which the Project and all components/activities are located (i.e., the area of maximum physical disturbance). The Project Area is considered to be a conservative estimate of the area of direct disturbance effects on VCs in this assessment.

**Vegetation LSA:** the area that surrounds the Project Area where all direct effects and most indirect effects are likely to occur on the Vegetation and Ecosystems, Listed Plant Species, and

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

Wetlands VCs. The Vegetation LSA is defined as the Project Area plus a 250 m buffer along roads and a 500 m buffer around all other infrastructure (1,161.8 ha).

**Terrestrial RSA:** the area that surrounds and includes the Vegetation LSA, established to assess the potential, largely indirect effects of the Project on Vegetation and Ecosystems, Listed Plant Species, and Wetlands VCs in a regional context. The Terrestrial RSA (40,173.6 ha) is defined as a minimum 8 km buffer around the Vegetation LSA and has been delineated to capture all indirect effects of the Project on the Vegetation and Ecosystems, Listed Plant Species, and Wetlands VCs and provide context for the type, distribution, extent, and prevalence of plant species and ecosystems in the region. The Terrestrial RSA also defines the area within which cumulative effects are likely to occur (i.e., CEA boundary).

Temporal boundaries identify when an effect is expected to occur in relation to specific Project phases and activities. The temporal boundaries are based on the timing and duration of Project activities, with the associated interactions with each VC and KI (where applicable). In the EA, the temporal boundaries are described as appropriate for each activity and cumulatively for the life of the Project.

The temporal boundaries for the EA represent the timeframes that the Project is expected to interact with and potentially affect Vegetation and Ecosystems, Listed Plant Species, and Wetlands VCs. The temporal boundaries are aligned with the Project development schedule as described in the EIS: Construction; Operation; Decommissioning; and Post-Decommissioning.

### 3.0 Existing Conditions

Wetlands are defined as “land that is saturated with water long enough to promote wetland or aquatic processes as indicated by poorly drained soils, hydrophytic vegetation and various kinds of biological activity which are adapted to a wet environment” (National Wetlands Working Group 1997). As such, ecosites have been determined to be wetland ecosystems where these conditions are expected to occur. This includes both wetland ecosites and sparsely vegetated ecosites where the water table is within 50 cm of the ground surface (McLaughlan et al. 2010). No wetlands within the Terrestrial RSA have been designated as Ramsar Wetlands of International Importance (The RAMSAR Convention Secretariat 2022).

Project-specific investigations pertaining to the Terrestrial Environment were conducted by Omnia Ecological Consulting (Omnia; Calgary, AB) from 2017 to 2019. Details on the methods, survey parameters and assumptions, and comprehensive data summaries/findings are presented in the Project-specific baseline report (Omnia 2020; see Appendix 9-B of the EIS) and a supplementary baseline annex report completed in 2021 (EDI 2021; see Appendix 9-C of the EIS).

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

Project baseline studies for vegetation presented a description of the ecosystems/habitat types (i.e., ecosite classifications) within the Terrestrial RSA. Vegetation communities and ecosystems are represented by provincial ecosite classifications for the Boreal Shield Ecozone in accordance with the Field Guide to the Ecosites of Saskatchewan's Provincial Forests (McLaughlan et al. 2010). These ecosite classifications were summarized within a 1:20,000 interpreted ecosite mapping product compiled within the Terrestrial RSA with the use of the following inputs:

- 1:5,000 anthropogenic features mapping;
- historical fires data;
- provincial Predicted Ecosite Mapping;
- current and historical imagery; and
- field sampling/ground truthing sites (EIS Appendix 9-B).

As the Boreal Shield Ecozone experiences a largely natural fire regime, much of the vegetation within the Terrestrial RSA (70.6%) is comprised of post-fire regeneration (i.e., shrubby structural stages). Twenty (20) upland ecosites were identified within the RSA with relative percentages by area estimated for each ecosite code.

The assessment also identified fourteen (14) wetland ecosite types within the RSA which included swamps, bogs, fens and shallow open water ecosite codes. The area of these wetlands was also estimated to provide a relative percent area of representation within the RSA.

This cataloguing of ecosite presence and relative area composition across the RSA provides the basis for understanding landscape change and succession over the course of the construction and operation of the Wheeler River Operation.

Waterbodies were conservatively included ~~here~~ as wetlands, as they have the potential to be classified as shallow open water wetlands (i.e., water bodies 2 m deep or less; Warner et al. 1997). Waterbodies represent the most common wetland ecosystem within the Vegetation LSA and the Terrestrial RSA, comprising 3.9% (44.9 ha) and 10.7% (4,101.9 ha), respectively. The black spruce treed bog is the second most common wetland ecosystem within the Vegetation LSA (18.2 ha, 1.6%) and the Terrestrial RSA (1,157.1 ha; 2.9%). The Labrador tea shrubby bog is the most common wetland ecosystem in the Vegetation LSA, comprising 2.0% (23.3 ha), and the second most common wetland ecosystem in the Terrestrial RSA (989.9 ha, 2.5%). All other wetland ecosites are relatively uncommon, each comprising less than 0.5% of the Vegetation LSA and Terrestrial RSA. The location, size and relative area composition of the wetland features

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

is provided in Table 2 and Figure 1). The initial classification and subsequent assessment of wetlands in the Terrestrial Environment (EIS Section 9) took a conservative approach in that the area of wetlands within the terrestrial study areas was likely over-estimated to assess potential changes in areal extend of wetlands.

**Table 2: Summary of Wetlands**

Ecosite Code <sup>1</sup>	Ecosite Description <sup>1</sup>	Structure Code <sup>2</sup>	Vegetation LSA (ha)	Vegetation LSA (%)	Terrestrial RSA (ha)	Terrestrial RSA (%)

**Notes:**

- 1 Ecosystems are described in detail in the Guide to the Ecosites of Saskatchewan's Provincial Forests (McLaughlan et al. 2010).
- 2 Modified from the Field Manual for Describing Terrestrial Ecosystems (BC Ministry of Environment, Lands, and Parks, and BC Ministry of Forests 1998). 0 = unvegetated; 1 = sparse / bryophyte / lichen; 2 = herb/graminoid; 3a = low shrub; 3b = tall shrub; 5 = young forest, 6 = mature forest.
- 3 This ecosite type is an artifact of mapping uncertainty, as baseline mappers were unable to distinguish between these ecosites due to a lack of available information (e.g., soil information, vegetation field plots, water quality data). As such, this ecosite has conservatively been split between bog and fen classifications.
- 4 Areas of open water <2 m deep are defined as shallow open water wetland ecosystems (National Wetlands Working Group 1997); as such, unnamed waterbodies and areas of open water observed to exhibit an average depth of <2 m (Ecometrix Incorporated 2020) have been conservatively included as wetland ecosystems.
- 5 Some numbers are rounded for presentation purposes. Therefore, the totals may not equal the sum of the individual values.

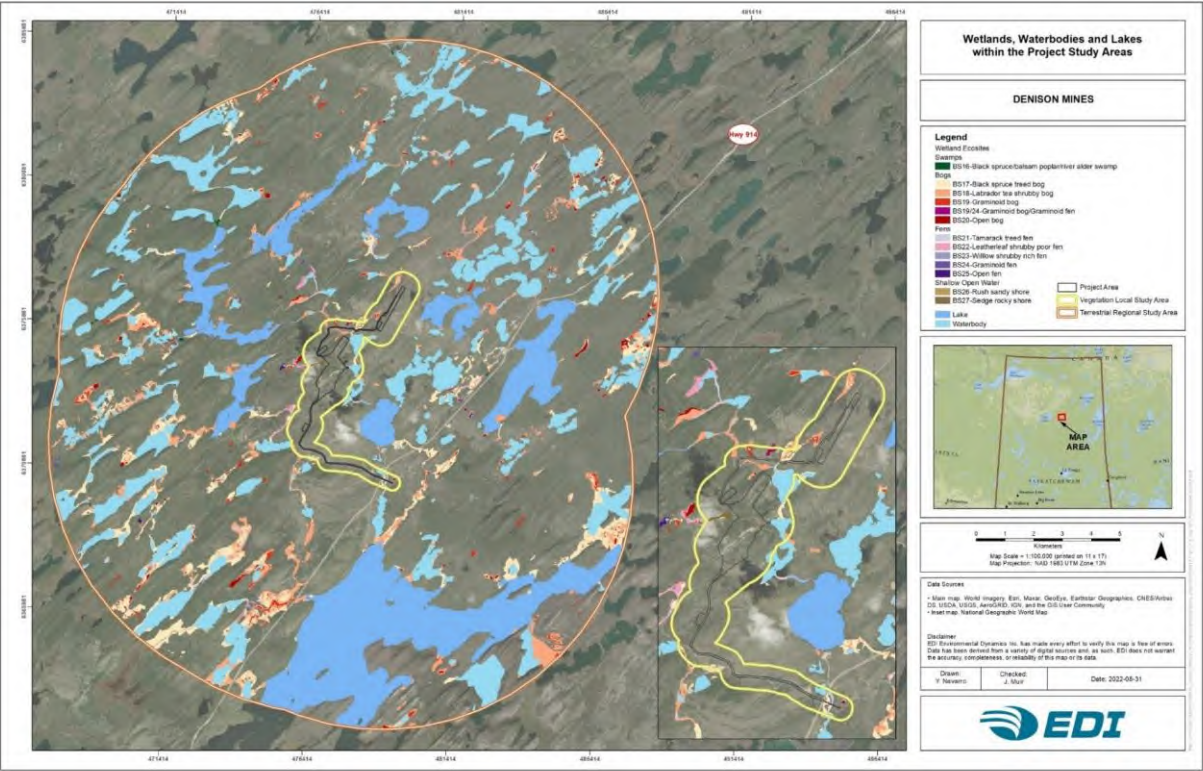

Figure 1: Wetlands, Waterbodies and Lakes within the Project Study Areas

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

Surface elevations for the wetland have been assessed and the information is summarized below and in the Figure 1-

- Wetlands 1.5 km west of the Project Area range from 526-524 masl
- Waterbodies and their surrounding wetlands directly to the east of the SSA are at an elevation of between 506 and 500 masl
- Waterbodies and surrounding wetlands 2 km east of site are approximately between 499 and 497 masl
- Wetlands north of the Project Area and in the vicinity of the proposed air strip range from 514-508 masl.
- Wetlands situated further north of the Project Area in the LSA were at an elevation of approximately 526 masl
- Southern wetlands that will interact with the proposed hydro corridor extension for the mine have an elevation of 491masl
- Most wetland evaluated south of the Project Area had elevations ranging from 491-488 masl

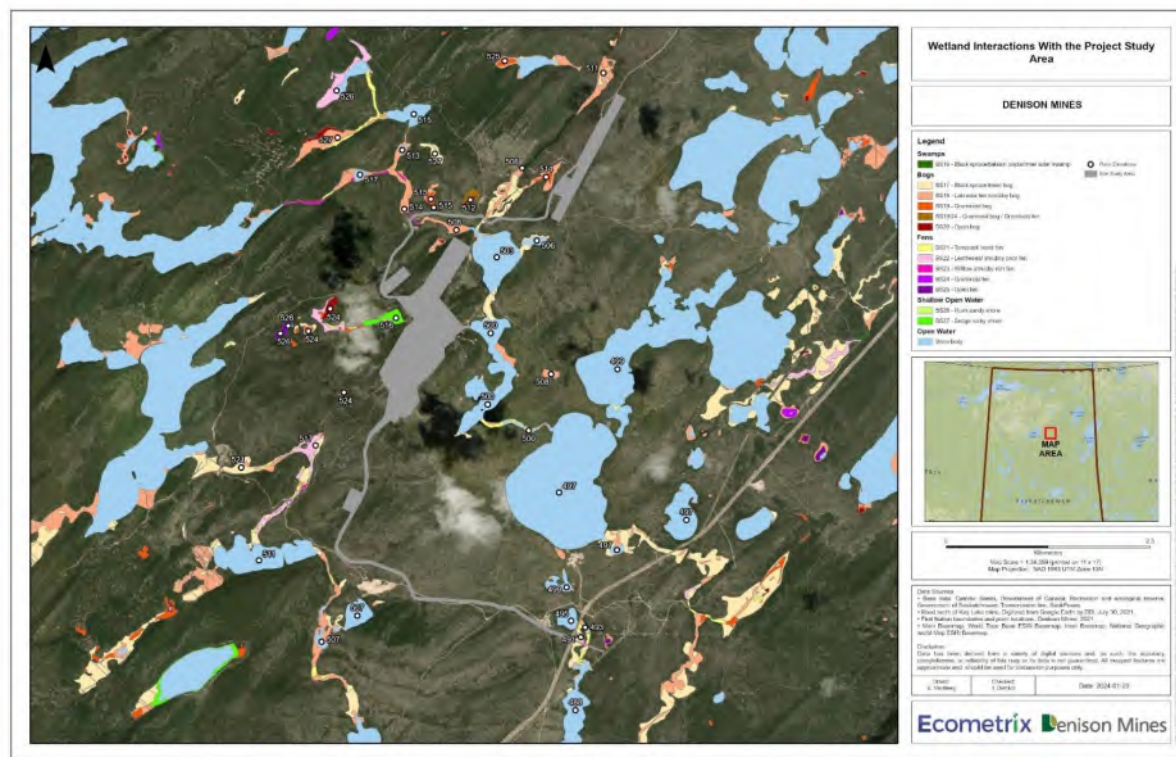

**Formatted:** Bulleted + Level: 1 + Aligned at: 0.63 cm +  
Indent at: 1.27 cm

Wetland depth, presence of fish or fish habitat, water quality and sediment quality are not currently available for the non-waterbody wetlands (i.e. those not identified as a lake or watercourse in Section 8 of the EIS). However, Denison is committed to conducting field surveys to collect this data prior to the initiation of construction of the Operation. This will allow for baseline information to be available to compare future changes and assess the success of mitigation measures and the predicted effects or lack thereof.

For the purposes of this assessment the bogs and fens within the area can be assumed to provide supporting fish habitat to the adjacent lake and river water bodies in the vicinity of the LSA. Refer to Appendix A below for additional information on the in-lake wetlands.

## 4.0 Assessment of Project Related Effects

### 4.1 Potential Interactions Between the Project and Valued Component/Key Indicators

The Project will require the Construction, Operation, and Decommissioning of several components (as described in Section 2 of the EIS). Potential interactions between these Project components and activities and Fish and Fish Habitat in the form of Wetlands and their associated KIs are summarized by Project phase and activity in [TableTable 4](#).

Potential interactions in [TableTable 9.2-9](#) are ranked as:

**Primary Interaction (✓):** Project activity is expected to interact with the VC / KI which may result in an adverse effect on the VC (i.e., a measurable or detectable change in the MP) and is further considered in the effects assessment as the primary contributor to potential adverse effects.

**Other Interaction (✓):** Project activity is expected to interact with the VC / KI. While the interaction is further considered in the effects assessment, it is not expected to be a primary contributor to potential adverse effects.

**No Interaction:** Project activity is not expected to interact with the VC or the KI, no adverse effects are expected, and rationale is provided for not considering this potential interaction further.

## 4.2 Potential Project-related Effects

Based on the timing and nature of the interactions identified in Table 4, the following adverse effects have a potential to occur on the Wetland VC (Table 5). The key indicator of effects to wetlands is the change in areal extent of wetlands in the study area.

**DATE:** 3 October 2024

## 4.3 Mobilization of Suspended Materials

### **Construction**

The primary effect pathway during Construction relates to the mobilization of suspended material into natural surface water features including wetlands as a result of land disturbance and clearing. The mobilization of suspended material into natural surface water features is readily mitigatable by virtue of the mine development plan and through the implementation of standard water management and sediment control practices. Water management infrastructure (e.g., collection ditches, ponds, pumping stations) and various aspects of the water management and sediment control management systems will be put into place coincident with the initiation of construction activities. Waters (e.g., runoff) associated with areas under development will be collected and stored within management infrastructure (e.g., clean waste rock pond, see Figure 2.2-14 in Section 2 of the EIS). In the event that releases to the natural environment are necessary, they would only occur once it is safe to do so (i.e., suspended solid levels in the water would be at acceptable levels). No downstream effects on surface waters, natural sediments, fish and fish habitat including wetlands are expected.

### **Operation**

During Operation, mobilization of suspended materials will be managed through the development and operation of water management infrastructure and implementation of surface water management through the Surface Water Management Program. Releases of contact water to the natural environment will be directed through applicable collection ponds, the IWWTP, and the Effluent Monitoring and Release Ponds. No specific discharge is expected to wetland features in the Project Area. Discharge will only occur once it is safe to do so (i.e., suspended solids levels in the water would be at acceptable levels). Denison may employ active means (e.g., filtering), if required, to achieve low TSS levels in discharge, in addition to passive means, such as settling and clarification in the IWWTP to manage TSS in the effluent stream to low levels. No

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

downstream effects on surface waters, natural sediments, or fish and fish habitat including wetlands are expected.

#### **Decommissioning and Post-Decommissioning**

During Decommissioning and Post-Decommissioning, the site-wide water management system will continue to operate such that Denison will maintain control of the site aspect affected water through the IWWTP. Surface drainage during Decommissioning activities will continue to be directed to the system of collection ponds, the IWWTP, and the Effluent Monitoring and Release Ponds to facilitate the control of suspended solids and achieve low TSS levels in the discharge, thereby minimizing any potential for adverse changes to water quality, sediment quality, and fish and fish habitat including wetland features.

#### **4.4 Overprinting of Wetlands as Fish Habitat**

For the purposes of this assessment the bogs and fens within the area can be assumed to provide supporting fish habitat to the adjacent lake and river water bodies in the vicinity of the LSA.

Bogs are predicted to be the wetland class most affected by the Project, with 0.4 ha (less than 0.1%) of mapped bog ecosystems within the Terrestrial RSA expected to be disturbed within the Project Area during Construction. Fens are the next most affected, with 0.1 ha (0.1%) anticipated to be disturbed during Construction (Figure 3). Less than 0.1 ha (less than 0.1%) of shallow open water wetlands within the Terrestrial RSA are also anticipated to be affected by the Project.

Within these wetland classes, the wetland ecosite expected to be most affected is the willow shrubby rich fen (ecosite BS23) with direct disturbance to 0.1 ha predicted to occur within the Project Area (0.5% of the BS23 ecosite within the Terrestrial RSA). The remaining ecosites anticipated to be directly affected by the Project are locally abundant, with direct disturbance expected to affect <0.1% of these ecosites within the Terrestrial RSA (Table 2).

Investigation of the potential overprinting of wetland features as a result of the Project it is evident that wetland loss is avoidable. The interaction of the Project with wetlands is isolated to those areas where stream crossings for access roads and hydro-line connections are proposed (Figure 3). With the use of single span bridges and implementation of best management practices, direct wetland disturbance associated with the crossings of Kratchkowsky Creek and Hart Creek is expected to be avoided. It should be noted that SaskPower proposes to tap the existing I3P 138 kV line near Highway 914 and build approximately 4.5 km of new 138 kV line from the I3P tap to the Project site. SaskPower will be responsible for conducting activities such as line routing, environmental studies, and permitting, public consultation, and engineering design work as applicable to the load interconnection. As such, wetland disturbance related to the SaskPower Hydro Corridor is expected to be addressed through the SaskPower permitting process.

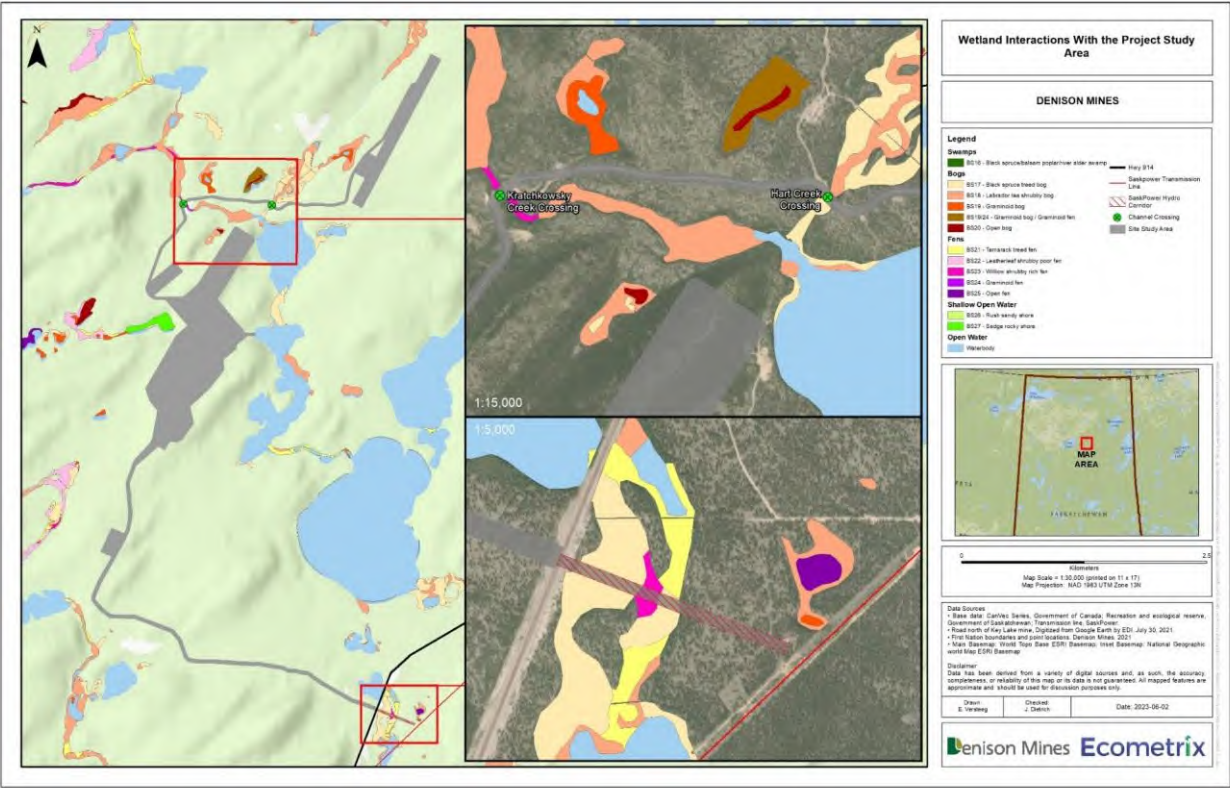

Figure 3: Denison Wheeler River Project Area and Wetland Feature Distribution

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

## 4.5 Controlled Discharge to Receiving Environments

According to the site water balance (Figure 2.2-14 in Section 2 of the EIS), there is no planned discharge to Whitefish Lake during Construction. Other than LA-5 (Whitefish Lake) no other controlled discharge will occur to the natural environment and no wetlands will be impacted as a result.

## 4.6 Change in Water Levels and Flow

As detailed in Section 8.1 of the EIS, the projected withdrawal and discharge rates proposed for the Project are the largest influence on the hydrological effects of the Project. The largest predicted change in streamflow rate is -3.1% at the LA-5 and SA-2 nodes (immediately downstream of the Project) during Operation and Decommissioning, as projected against the 5<sup>th</sup> percentile low flow dataset in March. Lake levels and wetlands are expected to deviate less than  $\pm 0.01$  m due to all Project influences. All Project influences on the environment are expected to return to baseline conditions during Post-Decommissioning. These changes are within the range of fluctuation of environmental flows and water levels and are unlikely to affect fish passage or life history environmental cues.

## 4.7 Introduction and/or Proliferation of Invasive Plants

Vegetation clearing and soil disturbance during Construction are expected to create conditions suitable for the introduction and proliferation of invasive plants. Vehicles and construction equipment can inadvertently transport seeds and other invasive plant propagules in tires or the undercarriage to previously unaffected areas. The effects of invasive plants on native vegetation diversity are well documented and recognized as the second greatest threat to listed species after habitat loss (Enserink 1999). Competition with native species can lead to a reduction in the growth and vigour of native species (including Wetlands), as well as changes in the diversity, structure and function of ecosystems and habitats.

The potential for the introduction and proliferation of invasive plants by transport on vehicles and equipment is expected to continue throughout Operation during wellfield and freeze wall drilling, expansion of ponds and pads, drill waste rock, process precipitates and industrial wastewater treatment plant precipitates, on-site and off-site operation of vehicles and transport of materials, package and transport of nuclear substances, and air transportation for workers (i.e., landing and taking off of airplanes). Progressive decommissioning and reclamation has the potential to introduce invasive plants on vehicles and equipment and if seed used for revegetation is not supplied from a native seed source (Polster 2003) with a certificate of analysis indicating an absence of invasive plant seeds.

The potential for the introduction and proliferation of invasive plants is expected to continue throughout Decommissioning (e.g., during closure of the ISR and freeze wells and infrastructure,

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

asset removal, demolition and disposal of non-salvageable surface infrastructure and materials, remediation of contaminated areas, reclamation of disturbed areas, and operation of vehicles and transportation of materials). The potential for the introduction and proliferation of invasive plants is expected to continue throughout Post-Decommissioning, but at lower levels due to reduced vehicle traffic.

#### 4.8 Edge Effects

Edge habitat refers to an area on either side of a border between vegetation communities. Edges between vegetation communities often result in altered microclimatic conditions that can influence environmental conditions further away from the edge (Bannerman 1998). Edge effects are expected to extend into areas of native vegetation and habitats at the interface of disturbed areas and undisturbed native ecosystems, and could include altered microclimatic conditions that can influence quality in habitat away from the edge (Bannerman 1998). Where edge effects occur, Wetlands may experience changes in light intensity, temperature, wind, moisture, relative humidity, and patterns of snow accumulation and melt relative to undisturbed conditions. This can, in turn, affect plant health and alter natural disturbance regimes (e.g., blowdown), plant population persistence, and the structure and function of ecosystems and habitats. If changes to microclimatic conditions or vegetative structure at an edge exceed a species habitat preference or physiological tolerance, then edge habitat may result in lower occupancy or use, reduced survival, or lowered reproductive success.

Edge effects at the interface of disturbed areas and native ecosystems are expected to occur along the edges of the Project Area resulting from vegetation clearing during site preparation and earthworks during Construction. Edge effects are expected to continue throughout Operation, Decommissioning, and Post-Decommissioning, decreasing over time as revegetation and tree growth within reclaimed areas of the Project create a gradual structural transition at forest edges, aided by natural encroachment.

#### 4.9 Long-Term Transport of Groundwater Solutes to Whitefish Lake in Future Centuries

During the 'future centuries' scenario as described in Section 8.3.1.3 of the EIS, remediation works will be completed and the site naturalized, thereby restoring drainage patterns to report to surface waterbodies. As indicated in Section 7 of the EIS, groundwater plumes may develop from residual mass remaining post-mining based on bench-scale lab tests of core flushing, and numerical modelling of reactive fate and transport. The results of this was described in Section 8.3.4.2.5 with respect to Fish and Fish Habitat and therefore wetlands.

The results of the numerical modelling (as provided in Section 7 and Appendix 10-A in Section 10 of the EIS) support the conclusion that with the implementation of appropriate mitigation during the decommissioning and restoration phases of the Project, the residual effects of the

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

Project on the intermediate Groundwater VC will not result in an adverse effect on surface water. Dissolved constituent concentrations emanating over hundreds to thousands of years in the future from the deep Ore Zone to Whitefish Lake are expected to remain below fresh water environmental quality criteria in Whitefish Lake.

Although the precise location of the groundwater discharge to the surface is somewhat uncertain, the groundwater transport scenarios that have been evaluated (Appendix 7-C of the EIS) to date suggest groundwater discharge impacted from mining will most likely be relegated to Whitefish Lake. The discharge to Whitefish Lake is generally predicted to occur along the eastern shore of the lake, as this is interpreted to be the eastern edge of the underlying desilicified zone. The Laborador Tea Shrubby Bog habitat located on the eastern shore of Whitefish Lake may be in the zone of influence of groundwater discharge, yet chemically will remain below freshwater environmental quality criteria. Groundwater impacts to other surrounding wetlands will be negligible as groundwater is not predicted to discharge within any area beyond the central portion of Whitefish Lake.

#### 4.10 Indirect Effects

Indirect disturbance associated with the potential to adversely affect BS19/24 includes the introduction and/or proliferation of invasive plants, edge effects, changes to water quantity and quality, and dust deposition during all Project phases (as described in Section 9.2.4.2.1). Wetland ecosites BS19/24 (graminoid bog/fen) and BS25 (open fen) are peatland ecosystems typically characterized by high water tables (i.e., a very moist or very wet moisture regime), while ecosite BS27 (sedge rocky shore) is a sparsely vegetated ecosystem predominated by rocky substrates, typically occurring adjacent to lakes and ponds (McLaughlan et al. 2010). Because these ecosystems rely on high water tables and existing waterbodies, alteration of water quantity would be expected to have the highest potential to cause an adverse effect. Therefore, maintenance of wetland hydrology is expected to be the most effective mitigation to sustain these wetland ecosites within the Terrestrial LSA throughout the Project lifespan.

### 5.0 Mitigation Measures

Mitigation measures specific to the wetlands, discussed in the following subsection are applicable during all Operation phases and expected to be effective immediately following implementation and managed through the EMP.

#### **Disturbance Reduction**

- Wherever possible, wetlands will be avoided through Project design and instituting proper buffers.

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

- Disturbance to vegetation and soils will be avoided by clearly delineating Project Area boundaries (e.g., with the use of fencing, staking, or flagging), adhering to construction plans and schedules, and by restricting off-site machine use.
- Wetland boundaries in the proximity of planned disturbances will be clearly delineated (e.g., with the use of fencing, staking, or flagging) to facilitate avoidance to the extent practicable.
- Should they occur, areas prone to potential instability and areas in proximity to water bodies and drainage features will be identified and appropriate setbacks will be established and maintained.
- Temporary workspaces or laydown areas will be sited and constructed within existing disturbance or on previously compacted soils, where practicable. In areas requiring clearing only, grubbing will be avoided, and roots and groundcover will be retained to the extent feasible.
- Pre-construction listed plant surveys will be completed within the Project Area.
- Listed plants located adjacent to planned disturbances will be clearly delineated (e.g., with the use of fencing, staking, or flagging) to facilitate avoidance to the extent practicable and reduce the potential for accidental encroachment outside of the Project footprint.
- Should Listed Plants be identified within the Vegetation LSA prior to Construction, site- and species-specific mitigation measures to avoid and/or limit Project effects will be determined by a Qualified Vegetation Ecologist. Specific mitigation measures will depend on the species, its life history characteristics, time of year, and the location of the occurrence in relation to Project activities.
- Herbicide use will be avoided within 100 m of any known listed plant occurrences. Where herbicide use is unavoidable, use will be restricted to direct application instead of broadcast spraying and completed by qualified personnel.

#### **Soil Handling and Reclamation**

- Construction activities will be sequenced (i.e., site clearing, grading preparations, major earthworks and construction of infrastructure/facilities) so that surface vegetation, mineral soil and organic matter can be salvaged for later use in Project Decommissioning.
- Soil resources within the Project Area will be stripped/salvaged and stockpiled within the Project Area in accordance with relevant soil management BMPs, i.e., providing guidance on ground-truthing soil conditions, flagging potential hazards and sensitivities, and

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

modifying practices in relation to environmental conditions and avoiding or minimizing inadvertent/incidental disturbance.

- A soil monitoring program/protocol (or equivalent) will be undertaken to verify soil salvage volumes and reclamation suitability (Section 9.1.8.2).
- Soil stockpiling locations will be sited to reduce soil handling and travel distances and designed to minimize the potential for soil degradation and downgradient effects, e.g., having defined height and width that optimize soil storage and stockpile stability, and having integrated erosion control measures and surface water management features (if/where necessary). Sediment and erosion control measures will be implemented in accordance with BMPs and commensurate to site conditions and sensitivities.
- Sediment and erosion control measures and surface water management features will be installed and maintained at the Project. Erosion controls (e.g., sediment fencing, check-damns and/or sediment ponds) will be installed as necessary and at the discretion of construction personnel commensurate to site conditions and sensitivities to manage/mitigate erosion and sedimentation.
- Progressive reclamation and ecosystem-based revegetation will be conducted on disturbed areas as soon as practicable with the use of suitable native species and in accordance with the Reclamation and Closure Plan.

#### **Surface Water Management**

- Snow melt and runoff will be controlled within the Project Area to prevent the potential release of contaminated runoff from affecting vegetation in adjacent areas.
- Sediment and erosion control measures will be implemented in accordance with the EMS.
- Surface water management features (e.g., culverts and ditches) will be constructed and maintained (as per Project design specification) along access roads and facility sites to facilitate surface drainage continuity and hydrologic connectivity—especially in proximity to wetlands, water crossings, and waterbodies.
- Hydrologic connectivity is expected to be maintained across the Project Area with the engineering, construction, and maintenance of surface water management features (e.g., culverts and ditches) as appropriate and as per Project design specifications along access roads and at facility sites.

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

### **Invasive Plant Management**

- Equipment and vehicles will arrive at the Project Area clean, and will be inspected for soil, plant material, and seeds, and cleaned as appropriate, to limit the potential for the introduction of invasive plants and noxious weeds.
- Areas with a high risk for the potential spread of invasive plants and noxious weeds (i.e., within or adjacent to existing infestations) will be avoided to the extent practicable; if work must occur in these areas, invasive plant management will be implemented before starting work.
- Gravel, fill, straw matting, or similar materials to be used for erosion control will be inspected to minimize the potential for seeds or propagules of invasive plants being brought to site.
- All employees and contractors on the Project will receive an employee orientation appropriate to the work they are undertaking, including instruction on the definition of invasive plants and their potential effects, mitigation measures to avoid the introduction and spread of invasive plants, and training on the presence and identification of common invasive plant species and those known to occur within the Project Area.
- Invasive plant monitoring will be conducted periodically by personnel skilled in invasive plant identification during all Project phases to assess, evaluate, and document invasive plant occurrences within the Project Area. Invasive plant surveys will be completed during a biologically appropriate time of year (e.g., when invasive plants can be identified) within areas identified as most susceptible to invasive plant introduction and spread, including roads, ROW, debris and vegetation management areas (e.g., slash piles, timber decks, exposed soil or stockpiles) and other regularly disturbed habitats.
- Three general treatment options may be used alone or in combination to control of invasive plants in the Project Area:
  - mechanical control – involves the physical removal of the plants;
  - chemical control – involves application of synthetic and/or natural herbicides; and,
  - biological control measures – involves use of living organisms (e.g., rusts, insects) to control selected invasive plant species.
- The type of treatment option selected for an invasive plant occurrence will be based on a combination of specific information including the identity of the invasive plant species and its provincial designation, the size and extent of the occurrence, time of year, the proximity of the occurrence to other susceptible areas (e.g., rare plant occurrences, wetlands, waterbodies), and the available control options. Where possible, control of

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

invasive plants will be completed in consultation with a qualified professional to minimize potential effects on native vegetation, ecosystems and wetlands.

- Seed used during re-vegetation will be certified weed free, with a valid "Certificate of Seed Analysis".

## 6.0 Residual Effects Evaluation

### 6.1 Residual Effects Characterization

Residual effects on the Vegetation and Ecosystems, Listed Plant Species, and Wetlands VCs have been assessed in relation to the RSA, and characterized in terms of direction, magnitude, geographic extent, frequency, duration, reversibility, context, and likelihood (Table 6). Residual effect evaluation of residual effects are provided in Tables 7, 8 and 9.

**Table 6: Definitions of Effect Characteristics Considered When Determining the Significance of Residual Effects**

Residual Effect Characteristic	Definition	Rating
Direction	Identifies whether the residual effect will be adverse or positive.	<b>Adverse</b> – Negative effect or effect is not desirable. <i>Water Quantity</i> – Effect moves MPs (flow or water level) in a direction detrimental to water quantity relative to baseline conditions. A Project-related increase in surface water flows and levels during flooding, or a decrease in surface water flow below environmental flow requirements. <i>Water Quality</i> – An increase in constituent concentrations attributable to the Project in comparison to baseline conditions and trends. <i>Wetlands / Fish Habitat</i> – A physical loss of available fish habitat (extent of area) in comparison to baseline conditions. <b>Positive</b> – Beneficial effect or effect is desirable.
Magnitude	The amount of change in a measurable parameter relative to baseline conditions.	<b>Low</b> <ul style="list-style-type: none"><li>▪ measurable decrease in the spatial extent of Wetlands, but less than a 10% loss; all original wetland classes are present.</li><li>▪ A measurable change that is not within the variability of baseline conditions but below relevant water quality objectives and criteria. A Project-related change in hydrology (flows or levels) compared to baseline conditions, but where the change is &lt;5% from baseline conditions</li></ul>

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

Residual Effect Characteristic	Definition	Rating
		<p><b>Moderate</b></p> <ul style="list-style-type: none"><li>measurable decrease in the spatial extent of Wetlands between 10% and 30% loss; measurable changes in the diversity of wetland classes; some original wetland classes may be absent.</li><li>A measurable change in water quality that is not within the variability of baseline conditions and not within applicable guidelines, legislated requirements, and/or federal and provincial management objectives. A Project-related change in hydrology (flows or levels) compared to baseline conditions, but where the change is &gt;5% from baseline conditions, and could, therefore, have an adverse effect on Fish and Fish Habitat within the LSA.</li></ul> <p><b>High</b></p> <ul style="list-style-type: none"><li>measurable decrease in the spatial extent of Wetlands greater than 30% loss; some original wetland classes are absent.</li><li>monthly flows (&gt; 10%), or lake surface elevation (m) in a waterbody or watercourse that is greater than the range of natural variability and large enough that fish can no longer rely on this habitat to carry out one or more of their life processes. A measurable change in water quality that is not within the variability of baseline conditions and not within applicable guidelines, legislated requirements, and/or federal and provincial management objectives and is likely to have an adverse effect on Wetlands (Fish and Fish Habitat) within the LSA, with the effect extending beyond the LSA.</li></ul>
Geographic Extent	The geographic area within which the residual effect is expected to occur.	<p><b>Project Area</b> – Effect is limited to the Project Area.</p> <p><b>Local</b> – Effect is limited to the Vegetation LSA.</p> <p><b>Regional</b> – Effect extends beyond the Vegetation LSA into the Terrestrial RSA.</p> <p><b>Beyond Regional</b> – Effect extends beyond the Terrestrial RSA.</p>
Duration	Length of time over which the residual effect is expected to persist.	<p><b>Short-term</b> – Less than 3 years (i.e., effect happens during Construction only).</p> <p><b>Medium-term</b> – 3 years to 38 years (i.e., effect happens from Construction through to the end of Post-Decommissioning).</p> <p><b>Long-term</b> – More than 38 years (i.e., effect extends beyond Post-Decommissioning).</p>
Frequency	How often the residual effect is expected to occur.	<p><b>Infrequent</b> – Effect occurs several times at sporadic intervals.</p> <p><b>Frequent</b> – Effect occurs many times on a regular basis.</p> <p><b>Continuous</b> – Effect occurs continuously.</p>

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

Residual Effect Characteristic	Definition	Rating
Reversibility	Whether or not the residual effect can be reversed once the activity causing the residual effect ceases.	<b>Fully Reversible</b> – A residual effect that diminishes to baseline conditions. <b>Partially Reversible</b> – A residual effect that partially diminishes to baseline conditions. <b>Irreversible</b> – A residual effect that will not diminish to baseline conditions.
Context	The extent to which the VC or KI has been affected by past and present environmental and socio-economic processes and conditions, its potential sensitivity to the Project-related residual effect, and its ability to recover from that effect (i.e., resilience)	<b>Low</b> – VC/KI has high resilience to stress or ecological change. This resilience can be a result of the ecological characteristics of the species or ecosystem, and/or a lack of historic and ongoing anthropogenic or natural disturbance. No listed species present. <b>Moderate</b> – VC/KI has moderate resilience to stress or ecological change. This resilience can be a result of the ecological characteristics of the species or ecosystem, and/or an intermediate level of historic or ongoing anthropogenic or natural disturbance with the capacity to assimilate more change. Presence of listed species <b>High</b> – VC/KI has weak resilience to stress or ecological change. This resilience can be a result of the ecological characteristics of the species or ecosystem, and/or a high level of historic or ongoing anthropogenic or natural disturbance. Presence of SARA-listed species
Likelihood	Likelihood that the residual effect will occur including consideration of the likelihood that the mitigation will be successful.	<b>Likely</b> – A moderate to high probability that the residual effect will occur. <b>Unlikely</b> – A low probability that the residual effect will occur.

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

**Table 7: Wetland Fish and Fish Habitat – Summary of the Residual Effect Characteristics for Surface Water Quality**

Residual Effect Characteristic	Rating	Summary Rationale for Rating
Direction	Adverse	The Project (specifically the discharge of effluent to the natural environment) will cause a change in the concentration of constituents, as measured as a mass of a chemical per unit volume in water (e.g., mg/L). Surface water quality in the local receiving environment will be adversely affected by effluent discharge to the aquatic environment, thereby providing a pathway to adversely affect surface waters. However, no discharge is planned to wetlands outside of Whitefish Lake.
Magnitude	Low	The magnitude of the residual effect is predicted to be low as constituents that may be introduced as part of Project activities are expected to remain below criteria for the protection of aquatic life and human health.
Geographic Extent	Local	The geographic extent of the residual effect is predicted to be confined to the immediate waterbody adjacent to the Project (i.e., Whitefish Lake). The estimated mixing zone is less than 5 m, implementing an effluent discharge configuration that promotes mixing.
Duration	Long-term	The residual effect is expected to last between 3 to 38 years (i.e., effect expected during Construction through to the end of Post-Decommissioning).
Frequency	Continuous	For the purposes of this EIS, a conservative scenario was identified, with effluent discharge being considered as continuous during Operation and Decommissioning.
Reversibility	Fully reversible	Surface water quality is expected to return to pre-development levels following Post-Decommissioning as Project-related sources will cease to operate.
Context	Low	Wetland health is expected to be resilient to changes in surface water quality in the context of this assessment, as COPC meet protective criteria even at the extreme low water scenario. Therefore, under applicable mitigative measures and average flow conditions, the contextual resilience of the aquatic system to respond to change is considered to be great.
Likelihood	Likely	A high probability exists that a change in water quality from background conditions will occur, but be restricted to Whitefish Lake and not other surrounding wetland features.

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

**Table 8: Wetland Fish and Fish Habitat – Summary of the Residual Effect Characteristics for Change in Area Extent**

Residual Effect Characteristic	Rating	Summary Rationale for Rating
Direction	Adverse	Impacts to wetlands in the LSA from physical disturbance or overprinting are expected to be minor in nature and relegated to wetlands located at stream crossings for access roads and the hydro-line corridor. In both cases the approach to design will be one of avoidance and minimal disturbance with clear span bridges and minimal clearing required for hydro-line installation where avoidance of open water areas can be met.
Magnitude	Low	The magnitude of the residual effect is predicted to be low. Less than 0.1% of Wetlands within the Terrestrial RSA are predicted to be directly affected as a result of Project Construction, and up to 1.5% may be indirectly affected during all Project phases.
Geographic Extent	Local	The residual effect is expected to be limited to the LSA, specifically to wetlands located at stream crossings for access roads and the hydro-line corridor
Duration	Long-term	Once natural drainage patterns are re-established following Operation, the structure and function of Wetlands altered as a result of indirect Project effects are expected to re-establish after Post-Decommissioning (more than 38 years).
Frequency	Frequent	While direct affects to specific Wetlands will occur over a short time period during Construction, Wetland alteration by indirect effects is anticipated to occur frequently throughout Construction, Operation, and Decommissioning, and infrequently during Post-Decommissioning.
Reversibility	Partially Reversible	Wetland effects are predicted to be partially reversible during Decommissioning once natural hydrologic conditions are reinstated. Alterations to wetland extent, structure and/or function as a result of indirect Project effects during all Project phases are predicted to be reversible over time once natural hydrologic conditions are reinstated and edge effects, dust, water quality changes, and invasive plant propagule pressure are reduced at the end of Decommissioning.
Context	Moderate	Wetlands can exhibit low resilience and high susceptibility to disturbance; however, disturbance is common within the Terrestrial RSA, and existing Wetlands have been historically disturbed by access roads and exploration activities.
Likelihood	Likely	The infrastructure associated with the bridges and the hydro-line are likely to affect the localized area for which they span in a limited way.

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

**Table 9: Wetland Fish and Fish Habitat – Summary of the Residual Effect Characteristics for Change in Surface Water Quantity (Hydrology)**

Residual Effect Characteristic	Rating	Summary Rationale for Rating
Direction	Adverse	Water quantity (flow and level) will be reduced in LA-5 as a result of the overprinting of its reporting drainage area by mine infrastructure and through site water balance. Water taking has an additional potential to reduce water levels in LA-5 and associated wetlands.
Magnitude	Low	The magnitude of the residual effect is predicted to be low. Under all scenarios, the Project-related change in hydrology (flows or levels) compared to baseline conditions is less than 5% of baseline conditions, and generally less than 3%.
Geographic Extent	Local	The residual effect is expected to be limited to the LSA, specifically the lakes and wetlands within proximity to the Project site (i.e., LA-5, LA-6, and LA-1).
Duration	Moderate	The residual effect is expected to last between 3 to 38 years (i.e., effect expected during Construction through to the end of Post-Decommissioning).
Frequency	Continuously	Although the mine is unlikely to require water taking on a continuous basis, this has been assessed as a bounding scenario and, as such, must be considered as a continuous effect.
Reversibility	Fully reversible	Surface water hydrology is expected to return to pre-development levels following Post-Decommissioning.
Context	Moderate	Surface water flow regimes are variable, and it is this variability that provides for morphological form to be maintained and for ecological reliance (i.e., wetlands, fish habitat). Some change to environmental flows is tolerated by wetland biota.
Likelihood	Low	Due to the localized nature and low magnitude of the effect on surface water hydrology, the likelihood of an effect is considered to be very low; therefore, the likelihood of an effect on Wetlands is expected to be low.

## 6.2 Significance and Confidence

The residual effect of change in the areal extent of the Wetlands VC as a result of the Project is not expected to result in a change to the wetlands KI that will alter its integrity within the Terrestrial RSA to the point where it is not sustainable or unavailable to contribute to ecological functions.

The threshold for significance for the Wetlands VC relates to predicted changes in the concentrations of water quality parameters, where changes could result in exceedances of

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

relevant water quality benchmarks that are protective of aquatic biota in waterbodies that receive mine-affected drainage. The threshold for significance for Wetlands also includes predicted changes in surface water flows greater than baseline environmental flows and direct habitat loss.

The significance of the residual effects on the Wetlands VC has been deemed **not significant**. Following mitigation, the residual effects are not expected to cause a change in Wetland habitat (or associated KIs) to the extent that they might alter the ecological integrity of the VC in the LSA beyond an acceptable level.

The predicted confidence with respect to the Wetlands VC is high as the mobilization of suspended materials can be readily mitigated, making the effects prediction relative to this effect pathway easily understood.

Confidence in the assessment of predicted effects on water levels or flow is quite high due to available hydrological data for the LSA. Uncertainty is minimal with the assumptions that the water withdrawal and discharge scenarios presented herein represent the bounding case, and hydrogeological modelling projections are not changed (Section 8.1 of the EIS).

Potential effects on water quality as a result of Project discharges to local receiving environments were assessed by way of numerical modeling. The in-lake wetlands will be subject to the same processes by which constituents are expected to accumulate in all lake sediments. That is sediments are in dynamic equilibrium with the water with the relationship between the two defined by the Kd (partition coefficient). The Kds used in the EIS are not habitat specific; they are derived from years of water and sediment data collected in the Athabasca Basin. The Kds would include a variety of habitats (e.g., nearshore vegetated littoral zones, depositional habitats) from which water and sediment quality data have been collected. These predictions are generally considered conservative in nature because the assumptions on which they are based are conservative. For example:

- The assessment is based on a continuous (year-round) discharge at an expected average effluent rate of 0.0101 m<sup>3</sup>/s (36.5 m<sup>3</sup>/hr) throughout Construction, Operation, and Decommissioning, despite the likelihood that effluent discharge will not be continuous and will only discharge when site water balance requires, based on water storage capabilities.
- The constituents in effluent discharge have been estimated conservatively. Presented discharge concentrations provided herein include contingency factors of one to three times.

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

- Baseline water quality is defined by the 95th percentile concentrations of individual constituents. Such an assumption is conservative as it constrains the assimilative capacity associated with the receiving environment. By definition, the assimilative capacity of a receiving environment is equal to the incremental difference between the existing baseline condition and the assessment benchmark (i.e., water quality criterion) on which the evaluation is based. Use of the 95th percentile concentration, rather than a measure of central tendency (i.e., 50th percentile, geomean), means that the incremental change in a given constituent concentration that can be assimilated by the receiving environment (whereby use of the receiving environment is protected) is relatively small in magnitude.

Due to the conservative nature of the assumptions on which the numerical assumptions are based, a high degree of confidence can be assumed.

### 6.3 Summary of Project Related Residual Adverse Effects

The results of the characterizations for these residual effects are summarized in Table 10. The residual effects of the Project on the Wetland KIs were predicted to be **not significant**. Thus, the residual effects of the Project on the Wetlands VC are predicted to be **not significant**.

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

**Table 10: Summary of Project-related Residual Effects**

Valued Component	Residual Effect	Project Phase	Direction	Magnitude	Geographic Extent	Duration	Frequency	Reversibility	Context	Likelihood	Significance
Wetlands	Change in Water Quality	C, O, D	A	L	L	LT	C	FR	L	L	NS
	Change in Water Level or Flow	C, O, D	A	L	L	MT	C	FR	L	L	NS

Significance: Not-Significant (NS), Significant (S)  
Level of Confidence: High (H), Moderate (M), Low (L)

## 7.0 Cumulative Effects

The cumulative effects are discussed in detail in Section 9.2.7 of the EIS and are not re-examined herein.

## 8.0 Summary

Bogs are predicted to be the wetland class most affected by the Project, with 0.4 ha (less than 0.1%) of mapped bog ecosystems within the Terrestrial RSA expected to be disturbed within the Project Area during Construction. Fens are the next most affected, with 0.1 ha (0.1%) anticipated to be disturbed during Construction. Less than 0.1 ha (less than 0.1%) of shallow open water wetlands within the Terrestrial RSA are also anticipated to be affected by the Project.

Within these wetland classes, the wetland ecosite expected to be most affected is the willow shrubby rich fen (ecosite BS23) with direct disturbance to 0.1 ha predicted to occur within the

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

Project Area (0.5% of the BS23 ecosite within the Terrestrial RSA). The remaining ecosites anticipated to be directly affected by the Project are locally abundant, with direct disturbance expected to affect <0.1% of these ecosites within the Terrestrial RSA.

Investigation of the potential overprinting of wetland features as a result of the Project it is evident that wetland loss is avoidable. The interaction of the Project with wetlands is relegated to those areas where stream crossings for access roads and hydro-line connections are proposed.

Avoidance through design as well as mitigation measures to control sedimentation to wetland features during construction, operation and decommissioning phases. Water quantity and quality are not expected to cause impacts to wetlands as the change in surface water feature levels and flow are nearly negligible and water will not be discharged to wetlands save for Whitefish Lake, for which effluent will not be released unless meeting criteria for the protection of aquatic life.

Residual effects on the Wetlands VC resulting from the Project were identified and assessed as **not significant**. Existing provincial legislation (Environmental Management and Protection Act [Government of Saskatchewan 2010] and the Water Security Agency Act [Government of Saskatchewan 2019b]) requires written approval (i.e., Aquatic Habitat Protection Permits) prior to any works within a wetland.

To further supplement existing information that exists for the LSA wetlands, Denison is committed to undertaking wetland surveys including the collection of water quality, sediment quality, benthic invertebrates and fish and fish habitat surveys prior to the construction of the operation to provide an updated baseline for assessing the success of mitigation measures and to assess potential effects of the project on wetlands. These locations will then be further considered as part of the EMP for continued monitoring for these media and biota.

**Appendix A   Orientation for CNSC Round 4 IR reviewers:  
Whitefish Lake (middle basin) inflow to McGowan Lake inflow**

**Formatted:** Heading 7,H1 Appendix, Indent: Left: 0 cm,  
First line: 0 cm

**DATE:** 3 October 2024

**TO:** Denison Mines – Janna Switzer

**REF:** Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

During a June 14, 2024 meeting to discuss Round 3 IR-101, the Federal-Indigenous Review Team indicated the wetlands of interest are those located within the nearshore environments of Whitefish Lake (Upper, Mid and Lower) as these lakes will directly receive treated effluent during operation.

The purpose of this appendix is to facilitate the CNSC's review of Denison's Round 4 response to IR-101 by summarizing information on the in-lake wetlands of interest.

While some of these in-lake areas were conservatively classified as wetlands in the terrestrial assessment (EIS Section 9), from an aquatic perspective, these in-lake wetlands of interest are littoral / nearshore zones in the lake and connecting channels. These in-lake wetland areas of interest are not cut-off from or isolated from the main basin of the lake. As such, it can be assumed that the lake environment is likely to be as depositional as the nearshore environment. The lakes of interests are very shallow (on average 1.5 m in depth) and therefore deposition may be as likely in the "offshore" environment as the nearshore.

This appendix provides a summary of four general areas (see marked up wetland map image below with areas circled and numbered in purple) from the inflow to Whitefish Lake (middle basin) to the inflow to McGowan Lake. An excerpt from Section 8's Figure 8.2-4 is also provided to orient the reviewer to the water quality, biota, and sediment sampling locations within these areas (refer to EIS Section 8 for details). The four areas shown in the wetland image are reviewed in the balance of this appendix with photographs and text / descriptive excerpts from the EIS to provide a general site orientation to the reviewers.

<p>Notes from Appendix 8-B, Appendix F (2019):</p> <p>SA-6 (Outflow from LA-6) SA-6 is the outflow from LA-6 and is equipped with a stage recording datalogger. The sensor and sensor housing at this location were replaced in August. Stage and discharge data for SA-6 are presented in Table 6 and the rating curve is shown as Figure 6. The cross-section is shown in Photo 11 for the July field program and Photo 12 is from the August field program.</p>	<p>Photo 11: SA-6 - July Field Program</p> 	<p>Photo 12: SA-6 - August Field Program</p> 
<p>Notes from Appendix 8-D (2016)</p> <p>4.6 SA-6 Station SA-6 is situated on the connecting channel between the north and south basins of Whitefish Lake, LA-6 (upstream) and LA-5 (downstream), respectively (see Figure 1-8). At this location the watercourse is 3rd order.</p> <p>4.6.3 Aquatic Habitat The surveyed reach (390 m) included the entire length of stream between the two lake basins. Mean wetted channel width, water depth and water velocity were 14 m, 0.7 m and 0.2 m/s, respectively. The banks were stable and the channel was meandering (see Appendix C, Photo 11). The stream gradient was low and stream morphology was primarily runs (75%) and pools (20%), with some flats (5%). The canopy was partly open. Instream cover was diverse, afforded by deep pools, aquatic macrophytes, boulders, logs and trees, and undercut banks. Substrates were comprised of 85% sand, 10% boulder and 2% silt. Observed aquatic vegetation included sedges, pondweed and horsetail (see Appendix C, Photo 12). Moderate algae growth and slight sediment were observed overlying the substrate and no barriers to fish migration were observed. The surrounding terrain was 50% upland and 50% lowland forest and observed riparian vegetation included jack pine, black spruce, sweet gale, and Labrador tea. Snails (Gastropoda), mayfly nymphs (Hexagenia sp.) and dragonfly nymphs were observed. Stream habitat characteristics are detailed in Appendix A, Table A-15.</p> <p>4.6.4 Fish Community A summary of the fish community is presented in Table 4-4. Detailed fish catch data including fishing effort and numbers of each species collected are presented in Appendix A, Tables A-13, A-16. Within a 150-m stretch of the reach, 1,531 seconds of electrofishing effort was expended during the fall 2016 survey, resulting in the capture of 24 fish from species. Twelve YOY and 3 adult Spottail Shiner, 4 YOY and 2 juvenile Burbot, 2 adult Ninespine Stickleback and 1 YOY Longnose Sucker were captured. The CPUE was 0.94 fish/minute of electrofishing. Three adult White Sucker, 1 adult Walleye, and 3 juvenile and 3 adult Northern Pike were captured by gillnet during the spring 2017 survey. In addition, 6 adult Northern Pike and 2 adult White Sucker were observed. The list of fish species identified during baseline surveys was reviewed by Bobby John, and is considered inclusive and comprehensive (Denison, 2020).</p>

 <p>Photo 11: Stream station SA-6 looking downstream (12 September 2016). This drainage area A station is situated on the connecting channel between lakes LA-6 (upstream) and LA-5 (downstream).</p>	 <p>Photo 12: Stream station SA-6 looking downstream (12 September 2016). Suitable spawning habitat for Northern Pike occurred near the inlet to lake LA-5, and adult pike were observed in the vicinity during the May 2017 spawning survey.</p>	 <p>SA-6 facing upstream, March 2018.</p>
<p>Notes from Appendix 8-B, Appendix D (2011):</p> <p>SA-6 Streamflow monitoring Station SA-6 drains from LA-6 and is upstream of SA-2. The stream section at this monitoring site is characterized by a sandy substrate, slow, deep, and laminar flow, and vertical banks. Although the right bank is well defined, high, and vegetated with trees, sand, and moss, the left bank is low lying with muskeg, shrubs and black spruce. The cross-section has a width of approximately 14 m. SA-6 produces a very good stage-discharge relationship and hydrograph.</p>	 <p>Photo 6: SA-6 looking upstream. Photo taken May 13, 2011.</p>

<p>Area of interest in Whitefish Lake, August 16, 2024</p>		
<p>Appendix 8-D:</p> <p>LA-5: 3.5.4 Aquatic Habitat</p> <p>An aquatic habitat assessment was undertaken by Golder in August 2012 (Appendix F). Shoreline vegetation at LA-5 consisted mainly of shrubs and black spruce with upland jack pine forest. The typical substrate observed for LA-5 was sand and organic matter. Shoreline slopes ranged from shallow to steep. Cover types for aquatic biota included emergent and submergent vegetation, interstitial spaces in coarse substrate, overhanging vegetation and woody debris. Observations made during the 2016-19 baseline studies were similar, confirming the earlier survey data.</p>

Area of interest at outlet of Whitefish Lake, August 16 2024:

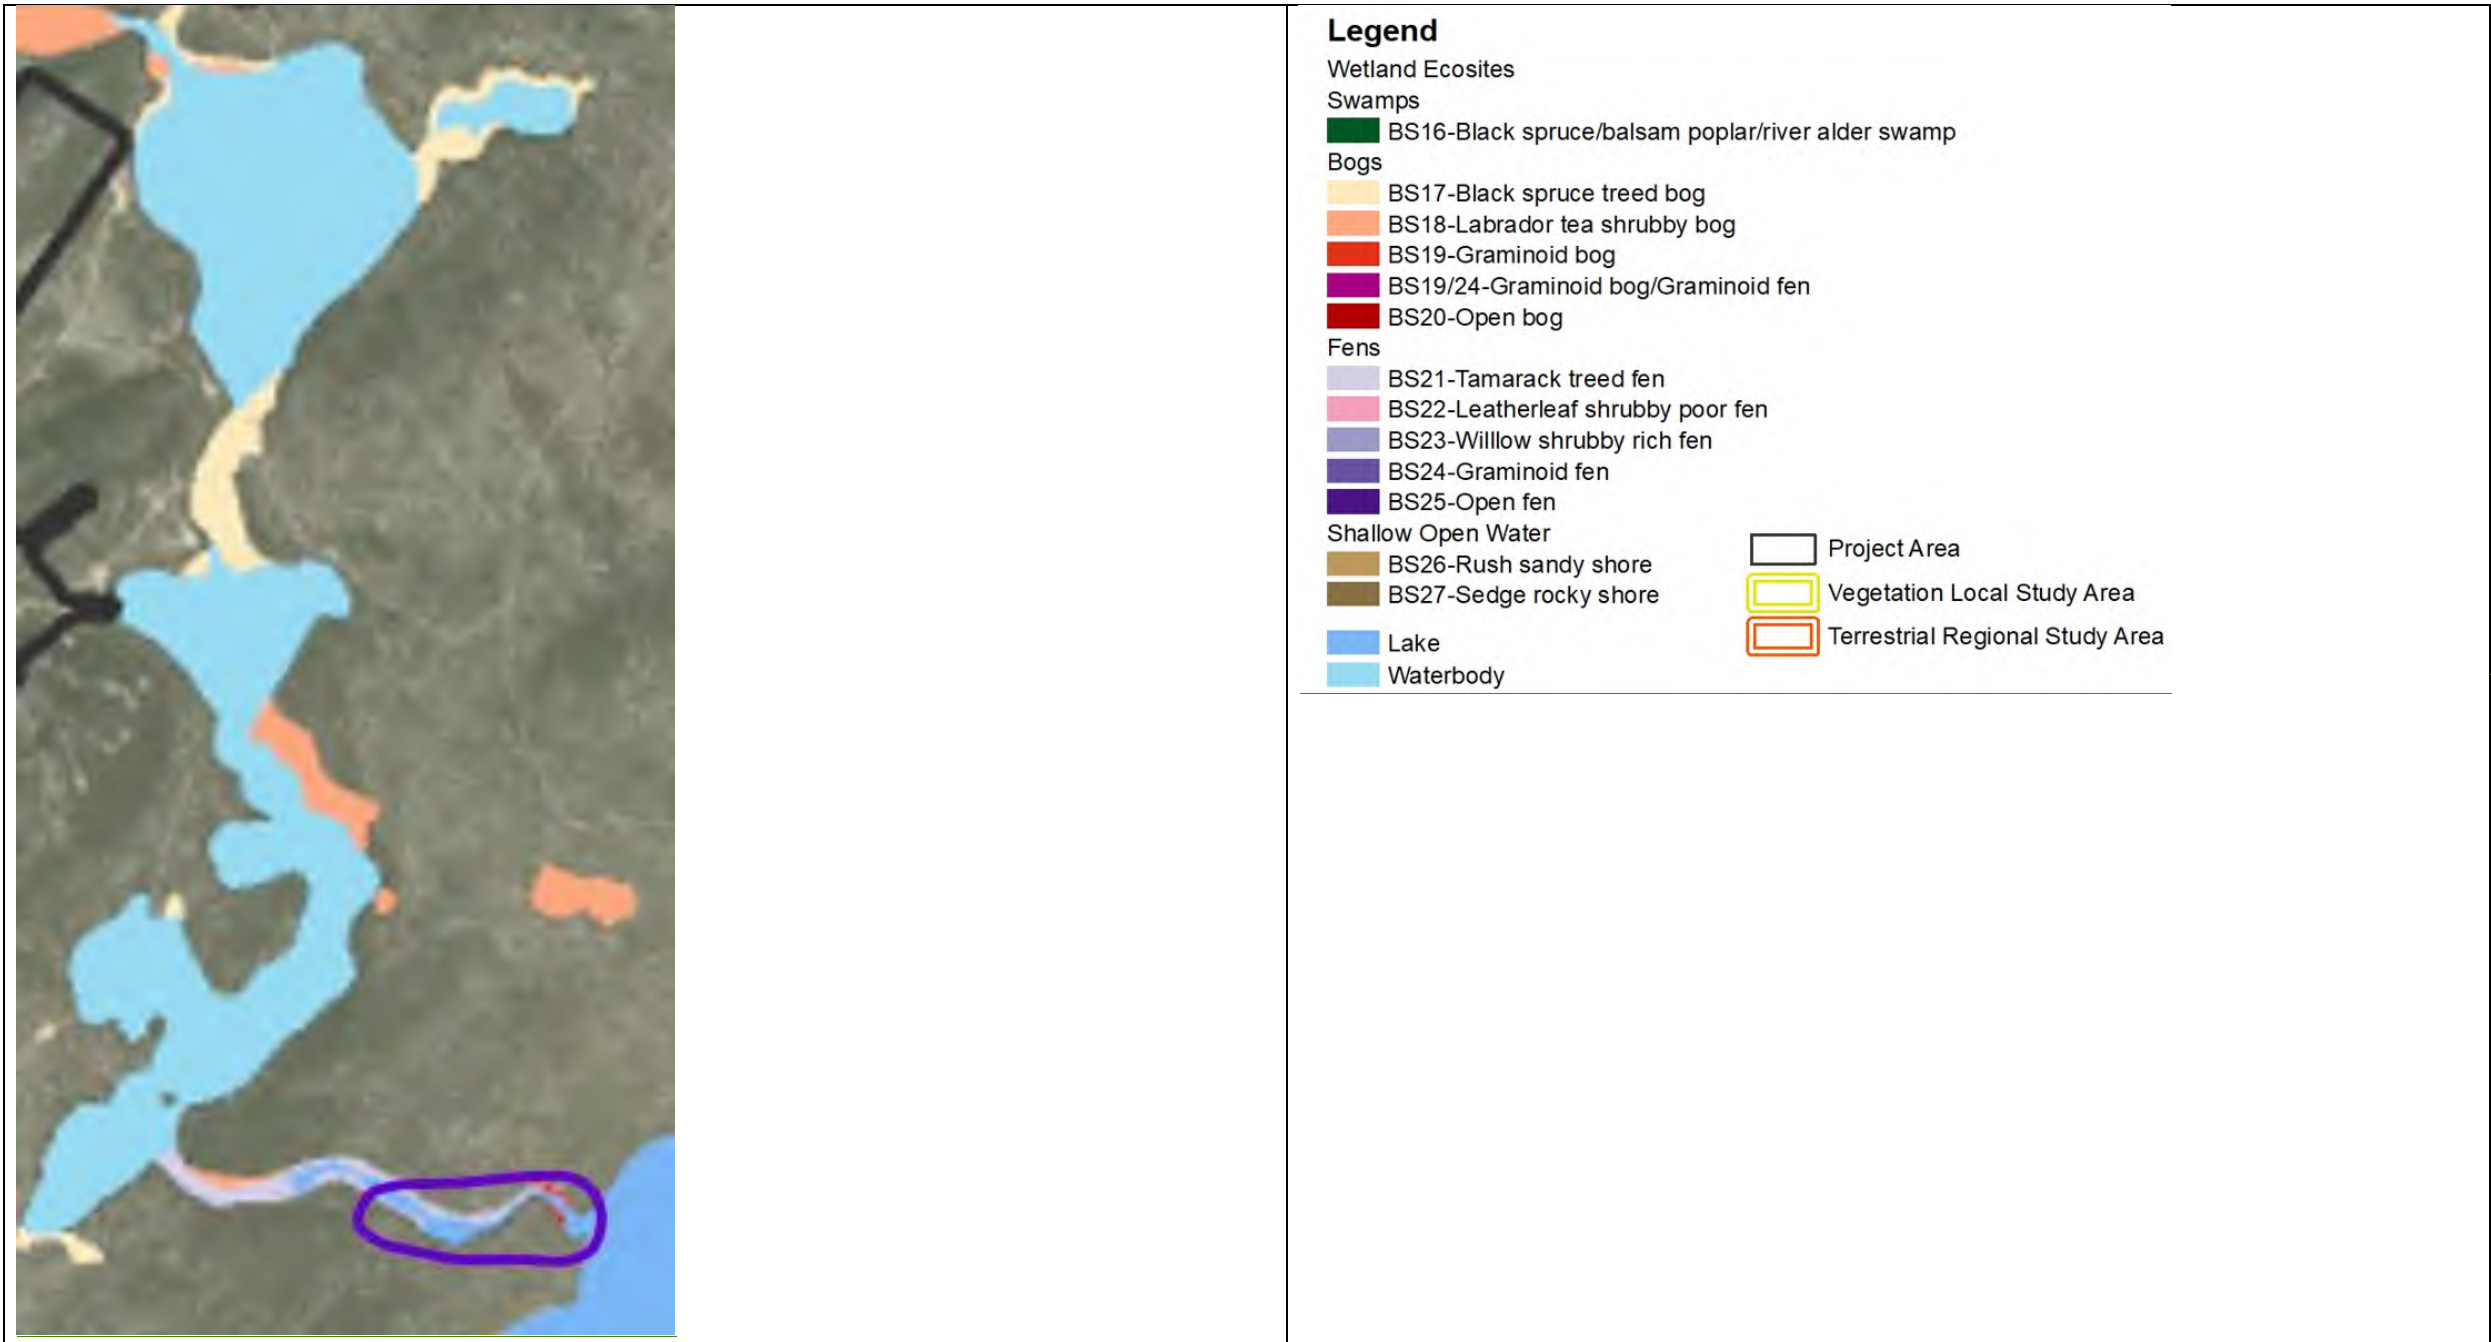

This area has stable banks and the substrate primarily composed of sand and detritus. The surrounding terrestrial vegetation was Black Spruce, Blue Spruce, and Jack Pine. The aquatic vegetation was Bur-reed and Potamogeton.

<p>Notes from Appendix 8-B, Appendix F (2019):</p> <p>SA-2 (Northwest Flow into McGowan Lake) Station SA-2 is located to the northwest of McGowan Lake. A datalogger is not installed at this location. During the 2019 monitoring program it was learned that the cross-section had been moved in 2016 creating a discrepancy in water levels. The old cross-section was identified during the August field program and sufficient data are available to correct the July 2019 measurement (Table 2 and Figure 2). The original cross-section will be used for measurements in future field monitoring programs. Photo 3 is taken of the cross-section used during the July field program while Photo 4 is the original cross-section used in August.</p>	<p>Photo 3: SA-2 - July Field Program</p> 	<p>Photo 4: SA-2 - August Field Program</p> 
--	---	--

<p>Notes from Appendix 8-D (2016):</p> <p>4.2 SA-2 Stream station SA-2 is situated within the Icelder River watershed, on the northwest tributary of McGowan Lake (LA-1), immediately upstream of the lake, approximately 800 m downstream of Whitefish Lake (LA-6) (see Figure 1-8). At this location the stream is 3rd order.</p> <p>Aquatic Habitat Mean wetted channel width, water depth and water velocity for the 285 m long surveyed reach were 9 m, 0.35 m and 1 m/s, respectively. The stream banks were stable and the channel was meandering with some braiding (see Appendix C, Photo 3). Within the surveyed reach, the stream gradient was mainly high to moderate. The stream morphology was mostly riffles (90%), with minor runs (5%) and pools (5%). The canopy was dense to partly open. Instream cover was primarily afforded by boulders and undercut banks, with minor contributions from logs and trees, deep pools and aquatic macrophytes. Substrates were comprised of 45% boulder, 40% cobble and 5% gravel, with trace amounts of sand and silt. Aquatic vegetation included sedges and horsetail (<i>Equisetum</i> sp.). Algal growth was moderate and no sediment were observed overlying the substrate. No barriers to fish migration were observed in the reach. The surrounding terrain was 90% upland and 10% lowland forest and observed riparian vegetation included jack pine, black spruce, alder (<i>Alnus</i> sp.), sweet gale, Labrador tea (<i>Ledum groenlandicum</i>) and willow. Stonefly nymphs and caddisfly larvae (<i>Trichoptera</i>) were observed. Stream habitat characteristics are detailed in Appendix A, Table A-15.</p> <p>4.2.4 Fish Community A summary of the fish community is presented in Table 4-4. Detailed fish catch data including fishing effort and numbers of each species collected are presented in Appendix A, Tables A-13, A-16. During the fall 2016 survey, 1,271 seconds of electrofishing effort was expended within a 285-m reach, resulting in the capture of 97 fish from 6 species. Slimy Sculpin were the most abundant species encountered, with 16 YOY, 19 juveniles and 35 adults collected. One YOY, 7 juvenile and 5 adult Lake Chub, 2 YOY and 5 juvenile Burbot, 2 YOY and 1 juvenile Northern Pike, 1 juvenile and 1 adult Arctic Grayling and 2 juvenile White Sucker were also captured. In addition, Walleye was observed but not captured. CPUE was 4.58 fish/minute of electrofishing. Eighteen adult White Suckers were captured by gillnet at this location during the spring 2017 survey. The list of fish species identified was reviewed by Bobby John, and is considered inclusive and comprehensive.</p>

REF: Wheeler River Project EIS – Appendix 8-F: Wetland Effects Assessment Report

Notes from Appendix 8-B, Appendix D (2011):

SA-2  
Streamflow monitoring station SA-2 flows into the northwest end of LA-1. The monitoring station at SA-2 is located several meters downstream of the transition between an upstream meandering channel and a downstream riffle section. The monitoring site has a cross-section width of approximately 11 m, is relatively shallow with high velocity flow. The substrate is primarily composed of boulders and cobble, with well-defined and stable vertical banks vegetated with shrubs and trees. SA-2 produces a fair stage-discharge relationship; however the slope is nearly linear, so it may overestimate low and high flows. Further measurements at extreme flows would help verify the accuracy of this rating curve.

- Reference to EIS, appendices, or supporting documentation: Section 8.2.3.3, Existing Surface Water Quality

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, June 28, 2024)	IR (ROUND 4, Sept. 16, 2024)	Denison Response (ROUND 4, October 11, 2024)
IR-107	-	<p><b>Context:</b> Under the methodology and metrics section (8.2.3.1) it is stated baseline water quality was sampled in 2016, 2018, and 2019. Looking at the data in Appendix A of Appendix 8D it seems that some waterbodies have little data available for baseline characterization. For example, Whitefish Lake only has 3 and 5 samples taken between its two sample stations, with sampling frequency seeming intermittent.</p> <p><b>Rationale:</b> The amount of data available for baseline water quality characterization does not seem sufficient to adequately characterize the baseline and the variation it would experience. An effective baseline characterization is vital to ensure water quality is indeed not being affected by the project. In addition, it is not clear if data quality objectives were applied to determine baseline information was adequate.</p> <p>To meet CEAA 2012 requirements, and CNSC expectations outlined in REGDOC 2.9.1, Environmental Principles Assessments and Protection Measures, the applicant is required to complete a characterization of the baseline environment.</p> <p>As described in REGDOC 2.9.1 Appendix B.2, Characterization of the Baseline Environment for Environmental Assessment Under CEAA 2012, the "baseline information should be sufficient to support the use of an aquatic dispersion model to conduct the site-specific ERA and to support an assessment of the effects of the environment on the facility or activity"</p> <p>In addition, the "applicant or licensee should include an assessment of any limitations or gaps in the quality and extent of baseline data and methods, as well as the method(s) by which they have been addressed."</p>	<p>Please clarify what data quality objectives were used for the baseline characterization data. Please provide justification whether the number of datapoints collected with inconsistent frequency in baseline surface water characterization is sufficient to meet data quality objectives and to adequately characterize the baseline, and whether Denison is confident that the data collected is enough for a robust water quality baseline characterization.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> CNSC recommends that additional water samples are collected and analyzed at a consistent frequency to ensure a robust baseline</p>	<p>Surface water quality was sampled through 2016, 2018, and 2019 on a monthly basis which is generally consistent with federal requirements for assessing potential impacts through EA. Hydrological assessment has occurred from 2011 to 2019. Mean Annual Discharge (MAD) (m³/s) as measured at the Water Survey Canada (WSC) Wheeler River Watershed Station (06DA005) during 2016, 2018 and 2019 was 17.07, 17.34 and 19.23, respectively, all of which were slightly above the 43 year (1977 to 2019) average of 16.82. The MAD in 2016 and 2018 can be considered near average, with 2019 being considered an average-high flow year, but well below the maximum observed for the timeseries (27.62 m³/s). Since this period, there have been no land use changes within the area that would constitute a major change in water quality.</p> <p>Baseline water quality samples were collected during years of average to average-high flows in the Wheeler River system and therefore representative of background conditions for assessment of potential impacts in the EIS. Additional conservatism was included in the impact assessment by using the 95<sup>th</sup> percentile values for baseline parameter concentrations when modelling potential effluent effects. As such, the surface water quality data collected are suitable for the intended purpose of assessing potential impacts and the additional conservativisms that were included as part of the assessment were precautionary.</p> <p>Given the above, Denison feels strongly that the baseline water quality data collected are suitable for the purposes of the EIS and the application of additional conservativisms in the use of the data provide a conservative (i.e., protective) framework for evaluating potential effects.</p> <p>Denison commits to the collection of additional surface water quality baseline data prior to project development starting to ensure updated baseline information is available for identification of any changes that might influence estimates of Project impacts. These data will be used to support permitting and licensing through updates to the ERA.</p>	<p>This response has not been accepted.</p> <p>From the baseline water quality data table (Table A-1 of Appendix 8D) it remains unclear that water quality was sampled on a monthly basis in 2016, 2018, and 2019, mainly due to Table A-1 referring to specific sampling dates, instead of an mean value of 12 samples/year. It is also unclear which federal requirements Denison is referring to using in their response. Staff are supportive of continued baseline monitoring to maintain an accurate dataset of baseline conditions.</p> <p>CNSC and ECCC staff have the following expectations:</p> <ol style="list-style-type: none"><li>1. Provide the monthly monitoring data referenced in the response or indicate where it can be found within the EIS and its appendices.</li><li>2. Confirm which federal requirements were used when assessing potential impacts through EA.</li><li>3. Confirm which data quality objectives were used to establish the baseline, provide references if available</li><li>4. Incorporate the additional available baseline data collected into the analysis and conclusions of the finalized EIS and ERA to increase the robustness of the established baseline.</li></ol>	<p>The response to this IR is provided in Attachment IR-107 (below).</p>	<p>Before this IR is accepted, the Proponent is requested to provide the statistical correlation analysis to confirm that data is correlated.</p> <p>Additionally, the four expectations set out in the rationale for status have not been adequately responded to. The Proponent should incorporate the following information into the EIS and ERA:</p> <ol style="list-style-type: none"><li>1. Provide raw baseline data (perhaps in an appendix).</li><li>2. Provide summary statistics for baseline datasets, which at a minimum should include: mean, standard deviation, 95th percentiles, minimum, maximum, and number of samples. Present summary statistics by season (i.e., freshet, summer, fall and under-ice), and include comparisons to relevant water quality guidelines.</li><li>3. Identify potential gaps in baseline datasets, and indicate how data gaps will be addressed. Describe the planned baseline monitoring to be conducted including, but not limited to, addressing any data gaps.</li><li>4. Demonstrate that the combined existing baseline data and planned baseline monitoring will yield dataset(s) that provide robust water quality baseline characterization of seasonal conditions (i.e., freshet, summer, fall, under-ice during winter), including a range of flow conditions.</li></ol> <p>The Proponent should also incorporate the additional baseline data collected into the analysis and conclusions of the finalized EIS and ERA.</p> <p>Concerning the other aspects of the IR, these responses are accepted based on Denison's commitment to conduct periodic sampling prior to construction to strengthen existing environmental data. CNSC staff will review this information to ensure EA predictions remain valid and recommend collecting samples in the fall to spring timeframe, as samples from these seasons is sparse in the current dataset.</p>	<p>Information specific to the statistical correlation or consistency in data between waterbodies during baseline investigations is provided in Attachment IR-107-R3 (below).</p> <p>Additionally, the four expectations outlined by ECCC are discussed herein.</p> <ol style="list-style-type: none"><li>1. All raw baseline data was provided in Appendix A-1 of Appendix 8-D of the EIS.</li><li>2. Appendix A-1 of Appendix 8-D included the following: mean, SD, 75<sup>th</sup> percentile, 95<sup>th</sup> percentile, minimum, maximum, sample size (n) and screening against criteria by date.</li><li>3. Denison and its SME does not consider that there are data gaps per se, as it concerns the data used for the purpose of the EIS. Denison and its SME feel strongly that the baseline water quality data collected are suitable for the purposes of the EIS and the application of additional conservativisms in the use of the data provide a conservative (i.e., protective) framework for evaluating potential effects. The data are spatially robust (in that they cover various sampling nodes in potentially affected watersheds that at this time are all subject to the same land use (or lack thereof) and samples have been collected during multiple seasons. Denison is in agreement that regular water quality data collection should be instituted and commits (Commitment 8-48 to beginning such periodic sampling prior to construction to provide a more robust dataset and following the CCME Guidance Manual for Optimizing Water Quality Monitoring Program Design (2015). Sampling will be conducted monthly during the open water period and twice under ice. Any new water quality data will be integrated into Denison's application for a licence to operate, along with updated effluent quality data</li><li>4. As noted above, information specific to the statistical correlation or consistency in data between waterbodies during baseline investigations is provided in Attachment IR-107-R3 (below).</li></ol> <p>Given the above (as well as the information provided in Attachment IR-107-R3), Denison and its SME do not feel additional analyses with additional baseline data are needed at this time, as suggested by ECCC, to inform EIS conclusions. Nevertheless, Denison will commit to update the analysis and predictions incorporating any new data collected during pre-construction baseline and licensing for operations, but there is no expectation that there would be any change to the EIS conclusions (see IRs 113, 114 and 115 for more detail in his regard).</p>	<p>Denison has addressed item 1 in the IR Round 3 requests, but has not adequately addressed items 2, 3 and 4.</p> <p>In Appendix A-1 of Appendix 8-D Denison has provided summary statistics; however, these summary statistics are for the pooled dataset and not for individual waterbodies and watercourses. Summary statistics should be provided for each individual waterbody/watercourse so that within and between-lake variation can be identified. Denison has not acknowledged or discussed current gaps and limitations in the baseline data and studies and has not demonstrated how the current baseline data is sufficiently robust to characterize natural variation. It is not clear how Denison meets the requirements of the Generic Guidelines for the Preparation of an Environmental Impact Statement – Pursuant to the Canadian Environmental Assessment Act, 2012 (referred to as “The Guidelines” from this point forward). In The Guidelines Section 8.1 Baseline Environment, it states:</p> <p>“The EIS will include a description of the environment, including the components of the existing environment and environmental processes, their interrelations and interactions, and the variability in these components, processes, and interactions over time scales appropriate to the EIS. In characterizing the environmental effects of the project, the proponent will consider the current baseline environment and environmental trends within the project area.”</p> <p>Denison currently has only conducted three water quality sampling events with one sample each in LA-5, on August 8<sup>th</sup>, 2012, April 1<sup>st</sup>, 2014, and September 10<sup>th</sup>, 2016. Not only is most of the data over 10 years old, but sampling was also only conducted in two seasons. It is not possible to adequately characterize environmental processes, trends and natural variation with the current dataset, and pooling data from multiple lakes further reduces the understanding of these factors.</p> <p>The correlation analysis that Denison provided in their supplemental information Round 3 response did not contain a statistical analysis comparing baseline data between sampled lakes in the LSA and RSA, therefore no determination could be made regarding the similarities between waterbodies. A comparison of mean percent differences between pooled datasets does not conclude that there is no significant difference without supporting statistical tests. Additionally, at no point was LA-5 the primary receiving waterbody compared individually to other waterbodies, LA-5 data continued to be pooled with data from other lakes to form the Key Assessed Lakes pooled dataset, which was then compared to the full LSA dataset. Pooling data, use of reference lake data with exposure lake data in pooled datasets, and use of the geometric mean are all uncertainties and data limitations that should be acknowledged and addressed as minimizing the ability to detect natural variation, including seasonal variation, within-lake</p>	<p><i>Note: Denison and the CNSC had a number of meetings and discussions on this Round 4 IR between Sept. 16, 2024 and October 9, 2024. The response provided here is focused on the central questions coming out of these discussions.</i></p> <p>Routine surface water quality sampling has started at the Wheeler River Project site. Denison made the commitment to collect additional pre-operational surface water quality data in commitment 8-48 and this work has been initiated. The list of surface water quality sampling stations, sample frequency, and analyte list is included in Attachment IR-107 (Round 4).</p> <p>For the CNSC's consideration, a comparison of June, July, August, and September 2024 water samples collected at Whitefish Lake (LA-5) is provided in Attachment IR-107 (Round 4) Table 1. As shown in the table, the results collected in 2024 are within the range (minimum to maximum) of pooled results for both the full LSA dataset and key assessed lakes. The majority of minor differences between recently collected samples and pooled datasets are related to differences in analytical detection limits. We note that a low-level trace metal analysis was used in 2024 and this resulted in lower detection limits for some parameters compared to previous results.</p> <p>We note that pooling of data to establish a background is not an uncommon approach. For example, such an approach is contemplated by Guidance on the Site-Specific Application of Water Quality Guidelines in Canada: Procedures for Deriving Numerical Water Quality Objectives (CCME 2003). This procedure acknowledges the use of "regional" data to derive background concentrations assuming the sites from which data are used "... are generally located nearby the site under consideration but have not been adversely affected by human activities." This description is accurate for the Wheeler River Project aquatic LSA which is in an unimpacted, remote area of Saskatchewan's boreal forest.</p> <p>We refer the reviewer to Appendix 10-A, Appendix A Section 3.2 for consideration of modelled average water baseline concentrations of COPCs and a comparison to measured values. The plots show trends over time for selected COPCs and the generally good agreement between the measured and modelled concentrations.</p> <p>Based on the data presented and methodology provided in relevant guidance, the baseline water quality data collected are suitable for the purposes of the EIS and the application of additional conservativisms in the use of the data provide a conservative (i.e., protective) framework for evaluating potential effects.</p> <p>As shown in Attachment IR-107 (Round 4) Table 2, surface water quality sampling will be conducted monthly during the open water period and twice</p>

								<p>variation at sampling sub-stations, year-to-year variation and between-lake variation. The requests below will serve to satisfy the principles of the Precautionary Approach and address these deficiencies.</p> <p>In order to resolve this IR, Denison are expected to:</p> <ol style="list-style-type: none"><li>1. Meet the requirements of the CNSC's guiding principles for protection of the environment REGDOG 2.9.1 Section 2.1 that "the licensee's license application shall demonstrate (through performance assessments, monitoring or other assessments) that their environmental protection measures are assessed against performance indicators and targets that are based on sound science", Denison should provide a statistical analysis including a power analysis comparing LA-5 baseline water quality data individually to other waterbody water quality data to determine if there is a statistically significant difference between water quality at various sites in the LSA. Denison should provide the methodology they will use to conduct the statistical analysis and power analysis for CNSC review and acceptance prior to completing the analysis. Pending the results of the statistical analysis:<ol style="list-style-type: none"><li>a. If the statistical analysis demonstrates that there is not enough statistical power to detect a significant difference between waterbodies, or that there is enough power and a significant difference between LA-5 and other waterbodies in the LSA, Denison will be required to provide additional baseline data to update the modelling during the EA process and update risk and significance conclusions as needed.</li><li>b. If the statistical analysis demonstrates that there is enough statistical power to detect a significant difference and that there is no statistical difference between LA-5 and the other waterbodies in the LSA, then Denison will not be required to provide further baseline data for the purposes of the EA, however Denison will still be expected to conduct further baseline characterization as per their commitments to collect more baseline data. Denison is also expected to still satisfy the other requirements in this IR.</li></ol></li><li>2. If currently available, incorporate any existing new data (post-2019) into the baseline dataset and update the analysis for submission in the finalized</li></ol>	<p>under ice. Per CNSC licensing requirements, the new water quality data along with updated effluent quality data will be integrated into the environmental risk assessment used to support Denison's application for a CNSC licence to operate and prior to effluent release to Whitefish Lake.</p>
--	--	--	--	--	--	--	--	---	---

									<div>EIS. Modelling should incorporate:<ul style="list-style-type: none"><li>a. Near-field modelling (LA-5) should utilize the 95th percentile values of data measured at LA-5 (i.e., not the pooled dataset); and</li><li>b. Far-field modelling of the downstream environment should utilize the 95th percentile values of the pooled dataset.</li><li>c. Water quality predictions should be updated accordingly.</li></ul></div> <div>3. Provide a commitment that, prior to the detailed design phase/ licensing to construct, the Proponent will:<ul style="list-style-type: none"><li>a. Conduct additional baseline monitoring to yield dataset(s) that provide robust water quality baseline characterization of seasonal conditions (i.e., freshet, summer, fall, under-ice during winter), including data collection for a range of flow conditions, at the receiver (LA-5) and downstream monitoring locations. At a minimum, data collection should prioritize collecting baseline water quality data for the immediate receiving environment (LA-5);</li><li>b. Update the baseline water quality characterization of seasonal conditions for LA-5 using the 95th percentile values of data measured at LA-5 (i.e., not the pooled dataset) and downstream environment using the 95th percentile values of location-specific data instead of pooled data.</li><li>c. Update the water quality modelling and predictions of risk as needed.</li></ul></div>	
--	--	--	--	--	--	--	--	--	--	--

## **Attachment IR-107 (included in Round 2 submission)**

### **Denison's Response:**

The water quality sampling for baseline was conducted over several years from 2011 to 2019. In years 2015 and 2017 sampling did not occur. Sampling occurred during the open water period and most consistently in May, June, August, September and October. The reviewer is correct in that sampling did not occur on a monthly basis at each of the sampling locations over all years. The table below provides a summary of the periodicity of sampling as it occurred over the described period at each station.

Station ID	2011		2012			2013		2014		2016	2018		2019		Total

1. The table above identifies that monthly sampling was not completed at each station on an annual basis.
2. For the purposes of the EA, a statistical analysis was conducted to identify the correlation between the water quality data for LA-1, LA-5, LA-6, and McGowen Lake and the full dataset for the LSA. Datasets were highly correlated and therefore the full dataset for the LSA was used as background concentrations in the IMPACT model. This approach was taken to meet the criteria of REGDOC 2.9.1 Appendix B.2, Characterization of the Baseline Environment for Environmental Assessment Under CEAA 2012, the “baseline information should be sufficient to support the use

of an aquatic dispersion model to conduct the site-specific ERA and to support an assessment of the effects of the environment on the facility or activity”.

3. Samples were collected following applicable field protocols and analysis was conducted by CALA accredited laboratories. The conceptualization of sampling in this remote location loosely followed the CCME Guidance Manual for Optimizing Water Quality Monitoring Program Design (2015). However, due to the remote nature during the baseline sampling, monthly sampling was not deemed feasible.
4. There are no additional data to add to the analysis at this time for either the near-field or far-field water quality models. It is noted that some additional sampling occurred at Whitefish Lake offshore in the general, vicinity of the proposed discharge (diffuser) location in 2022 and continued in 2023. The concentration of constituents from samples collected in 2022 and 2023 were in the range of those measured previously and as a result no changes to the outcomes of the analyses presented in the Draft EIS and its supporting documents would be expected. Denison agrees that regular water quality data collection at a wider range of sampling stations should be instituted and commits to beginning such periodic sampling prior to construction to provide a more robust dataset and following the CCME Guidance Manual for Optimizing Water Quality Monitoring Program Design (2015). These data would be used to support the licensing process and contribute to the longer term data records for the site.

## **Attachment IR-107 (Round 3 submission)**

Water quality of the waterbodies within the local study area (LSA) of the Wheeler River Project was surveyed over the period 2011 through 2019 as part of the aquatic environment baseline studies. Generally, surface waters within the LSA are soft and have typically low levels of alkalinity, nutrients (nitrate and phosphorus), total dissolved solids, and total suspended solids. The pH of surface waters within the LSA is slightly acidic to neutral. The concentrations of metals and metalloids are similar throughout the study area. Radionuclide concentrations are low, with the majority of measurements lower than their respective laboratory detection limits.

To determine which dataset was more appropriate to be used as baseline concentrations in the IMPACT model for the purposes of the Environmental Assessment, a statistical analysis of water quality data was undertaken to identify the correlation between the water quality data for only the key assessed lakes (LA-1, LA-5, LA-6, LA-7, and Russell Lake) and the full dataset for all waterbodies surveyed within the LSA.

For the purposes of the Environmental Assessment, a statistical analysis was undertaken to identify the correlation between water quality data from the key assessed lakes (LA-1, LA-5, LA-6, LA-7 and Russell Lake) and from the full dataset for the local study area (LSA), to determine which dataset was more appropriate for use as background concentrations in the IMPACT model.

The following provides methods and results and a summary of findings of this analysis.

Water quality data for lakes and creeks in the LSA were obtained for multiple monitoring events from June 2011 to September 2019. The data consisted of measurements of chemical parameters including physical tests (e.g., major ions and metals concentrations), nutrient tests (e.g., ammonia), and radionuclides (e.g., Pb-210). Data were inputted into the Ecometrix database software Environmental Monitoring Modeling Application (EMMA) and contained indicators for when measurements were less than the reported detection limit (RDL). The parameters examined herein are those chemicals of potential concern (COPC) for purposes of the Environmental Assessment (Table 1).

For the comparison, summary statistics were generated for two datasets: the full dataset and a subset of the key assessed lakes and creeks that link the key assessed lakes. The summary statistics including the number of measured samples (N), the number of measured samples below the reported detection limit (N<RDL), the minimum, the 95th percentiles, the maximum, and the geometric mean and standard deviation were calculated for both datasets using EMMA. For measurements below RDL, the detection limit value was used when generating summary statistics. Finally, the percent difference between geometric mean values of the two datasets were calculated per COPC.

The mean percent difference of key assessed lakes relative to the full LSA dataset across all COPC's was 0% (n = 24) with a minimum absolute percent difference of 0% and an absolute maximum percent difference of 16%. There were 20/24 (83%) with an absolute maximum percent difference of 5% and 22/24 (92%) with an absolute maximum percent difference of 10% (Table 1).

These low percent differences indicated that the datasets are highly correlated and because the full dataset also contained more datapoints and waterbodies, the full dataset for all waterbodies surveyed within the LSA was deemed most appropriate to be used as baseline concentrations in the IMPACT model.

Table 1 Summary statistics and percent difference calculations for COPC water quality parameters in the full LSA dataset (shaded) and key assessed lakes (unshaded).

	Full LSA dataset
	Key assessed lakes dataset

**Notes:** N is number of lakes/creek sampling locations; SD is standard deviation.  
Analysis of 2024 samples included low-level trace metal analysis, resulting in lower detection limits for some parameters compared to previous results.  
<sup>1</sup> These 2024 results were higher than pooled maximum value because of a higher detection limit.

Attachment IR-107 (Round 4) Table 2: Wheeler River Project sampling locations, frequencies, and parameters for the pre-operational surface water monitoring program

Station ID	Description	Sampling frequency	Water quality and water chemistry parameters
SA4	LA6 inlet tributary	Monthly during the open water period and twice under ice.	Field water quality measurements (dissolved oxygen, pH, conductivity, temperature) and water chemistry laboratory analysis (the following analytes are currently included in surface water quality monitoring: Bicarbonate; Carbonate; Chloride; Chloride, dissolved; Hydroxide; P. alkalinity; pH; Specific conductivity; Sum of ions; Total alkalinity; Total hardness; Ammonia as nitrogen; Nitrate; Total Kjeldahl nitrogen; Mercury; Methylmercury; Organic carbon; Organic carbon, dissolved; Fluoride; Total dissolved solids; Lead-210; Polonium-210; Radium-226; Thorium-228; Thorium-230; Thorium-232; Calcium; Calcium, dissolved; Magnesium; Magnesium, dissolved; Potassium; Potassium, dissolved; Sodium; Sulfate; Sulfate, dissolved; Aluminum; Aluminum, dissolved; Antimony; Antimony, dissolved; Arsenic; Arsenic, dissolved; Barium; Barium, dissolved; Beryllium; Beryllium, dissolved; Bismuth; Bismuth, dissolved; Boron; Boron, dissolved; Cadmium; Cadmium, dissolved; Chromium; Chromium, dissolved; Cobalt; Cobalt, dissolved; Copper; Copper, dissolved; Iron; Iron, dissolved; Lead; Lead, dissolved; Lithium; Lithium, dissolved; Manganese; Manganese, dissolved; Molybdenum; Molybdenum, dissolved; Nickel; Nickel, dissolved; Rubidium; Rubidium, dissolved; Selenium; Selenium, dissolved; Silicon, soluble; Silicon, soluble, dissolved; Silver; Silver, dissolved; Strontium; Strontium, dissolved; Sulfur; Sulfur, dissolved; Thallium; Thallium, dissolved; Tin; Tin, dissolved; Titanium; Titanium, dissolved; Uranium; Uranium, dissolved; Vanadium; Vanadium, dissolved; Zinc; Zinc, dissolved; Zirconium; Zirconium, dissolved; Phosphorus; Phosphorus, dissolved. Note that metal analysis (both total and dissolved) are being done using a low-level analytical techniques)

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, July 5, 2024)	IR (ROUND 4, Sept. 6, 2024)	Denison Response (ROUND 4, October 15 2024)
IR-114	-	<p><b>Context:</b> Tables 8.2-9, 8.2-10 and 8.2-13 demonstrate predicted maximum effluent concentrations of COPCs and maximum predicted receiving environment concentrations in the near- and far-field. General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, TSS and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization.</p> <p>For zinc, it is unclear how guidelines have been calculated when CCME thresholds can only be derived with hardness values &lt;250 mg/L. Additionally, water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment baseline concentrations.</p> <p>Mercury has been identified as a COPC of interest to Indigenous groups for the proposed Project. Table 8.2-8 indicates that background concentrations of mercury in LA-5 are low, and predicted effluent concentrations are also low. However, no information has been provided on background methylmercury concentrations or expected atmospheric deposition of mercury from Project related emissions. Predicted effluent concentrations of 3915 mg/L of sulphate are quite high, and sulphate is known to increase mercury methylation rates in aquatic environments.</p> <p><b>Rationale:</b> A review of all modelling results for all COPCs under the MDMER will assist ECCC in understanding the potential risks to the receiving environment. ECCC recommends the use of the most stringent guidelines for the protection of aquatic biota. All water quality thresholds should be derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC exceedances of water quality thresholds.</p> <p>Increased sulphate availability can lead to increased methylation rates of mercury and methylmercury in sediment and surface water. Methylmercury is a toxin that can bioaccumulate within the food chain and present risks to aquatic biota and wildlife consuming aquatic biota. Potential changes to methylmercury concentrations in water quality, sediment and fish tissues should be assessed due to the proposed sulphate loadings in effluent.</p> <p>Additionally, in accordance with the MDMERs, Denison will be required to demonstrate that their effluent quality meets the limits in the MDMER. Denison is expected to provide the predicted effluent quality for lead, nickel, and un-ionized ammonia to demonstrate compliance with the MDMERs.</p>	<p>1. Update all tables to include all COPCs with required monitoring under the MDMER including acute and chronic thresholds.</p> <p>2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and use water quality guidelines that are protective of aquatic biota.</p> <p>3. Provide baseline data on the concentrations of methylmercury in surface water, sediment and fish tissues (i.e., large- bodied sports fish and small-bodied forage fish) in the LSA and RSA receiving environment to establish a baseline prior to potential Project impacts.</p> <p>4. Provide an assessment of risk from methylmercury to ecological receptors due to changes in sulphate concentrations in effluent, and potential deposition of mercury from Project related atmospheric emissions in the receiving environment.</p>	<p>See response in Attachment IR-114.</p>	<p>This response has not been accepted.</p> <p>The Proponent has not updated all tables to include missing data for mercury, aluminum, total suspended solids, iron, thallium, manganese, nitrate, and phosphorous, all of which are COPCs with monitoring requirements under the MDMER.</p> <p>The Proponent has not updated tables to include predictions of total hardness concentration in effluent and the receiving environment or acute water quality thresholds, and water quality thresholds have not been derived using baseline receiving environment concentrations.</p> <p>All water quality thresholds should be derived from receiving environment parameters to determine if any baseline receiving environment and effluent COPCs exceed water quality thresholds.</p> <p>Please:</p> <p>1. Update all tables to include missing data for mercury, aluminum, total suspended solids, iron, thallium, manganese, nitrate and phosphorus.</p> <p>2. Update tables to include predictions of total hardness concentrations (in mg/L CaCO3) in effluent and the receiving environment.</p> <p>3. Update tables to include acute water quality thresholds to ensure COPCs do not have the potential to be acutely lethal at the end-of-pipe.</p> <p>4. Ensure that all selected water quality thresholds are derived using baseline receiving environment concentrations and use water quality guidelines that are protective of aquatic biota.</p>	<p>Please see Attachment IR-114. Briefly, Tables 8.2-9, 8.2-10 and 8.2-13 have been updated in the revised Draft EIS as requested.</p>	<p>In response to the FIRT’s previous review, Denison provided responses to the following outstanding requests from ECCC:</p> <p>1. Update all tables to include missing data for mercury, aluminum, total suspended solids, iron, thallium, manganese, nitrate and phosphorus.</p> <p>2. Update tables to include predictions of total hardness concentrations (in mg/L CaCO3) in effluent and the receiving environment.</p> <p>3. Update tables to include acute water quality thresholds to ensure COPCs do not have the potential to be acutely lethal at the end-of-pipe.</p> <p>4. Ensure that all selected water quality thresholds are derived using baseline receiving environment concentrations and use water quality guidelines that are protective of aquatic biota.</p> <p>The Proponent has resolved item two and four of the above, but items one and three require additional follow up.</p> <p>Regarding item one, further corrections to Table 8.2-13 are necessary:</p> <ul style="list-style-type: none"><li>• There are several inconsistencies in the footnotes:<ul style="list-style-type: none"><li>◦ numbers 2 &amp; 3 are missing in the footnotes at the bottom;</li><li>◦ there is no reference to footnote 2 in the table; and</li><li>◦ The asterisk “*” , which is sometimes used to qualify the source of screening concentration, is not defined.</li></ul></li><li>• Screening criteria are missing for aluminum and iron, and should be sourced from CCME or SEQG rather than the MDMER as listed in the table.</li><li>• Uranium-234 and uranium-238 are missing from the table, even though they have been identified as contaminants of potential concern.</li><li>• Proposed screening criteria for cobalt, copper, manganese, nickel, phosphorous and un-ionized ammonia are inadequate, see comment in IR-108 &amp; IR-108-R1.</li></ul>	<p>Item 1 – further corrections to Table 8.2-13 have been made (please see updated Table 8.2-13 in Attachment IR-114-R3) as follows:</p> <ul style="list-style-type: none"><li>• Footnotes were restructured and are provided in Attachment IR-114-R3 for each of the tables that were updated.</li><li>• Screening criteria were added for aluminum and iron, and sourced from CCME or SEQG.</li><li>• Uranium-234 and uranium-238 were added to the table.</li><li>• Proposed screening criteria for cobalt, copper, manganese, nickel, phosphorous and un-ionized ammonia were changed as applicable and are consistent with other tables as associated with IR-108 &amp; IR-108-R1.</li><li>• Un-ionized ammonia is updated to only be provided in one line. The first line provided previously was associated with a miscalculation of the un-ionized ammonia value and was the unionized ammonia-N value. The values provided as part of Attachment IR-114-R3 should be considered correct for unionized ammonia for comparison against the guideline.</li><li>• The column with screening values now is consistent across all tables that are presented as part of Section 8 and in Attachments for IRs 108/108-R1, 114 and 115.</li><li>• Table 8.2-14 was updated with corrections to screening criteria necessary for this IR as well as for IR-108 and IR-115 (please see Attachment IR-114-R3).</li><li>• Table 8.2-10 was updated to include the source for the short-term screening criteria value for arsenic (please see Attachment IR-114-R3 for updated Table 8.2-10).</li></ul>	<p>In a supplementary submission provided on July 5th, Denison provided corrections to some tables. However, errors and conflicting information remain within and between tables.</p> <p>In order to resolve this IR, Denison are expected to correct the following issues:</p> <p>1) Provide the following updates to Tables 8.2-8, 8.2-10, 8.2-13, and 8.2-14 to correct the errors outlined. Additionally, in Table 8.2-13 MDMER Schedule 4, the maximum authorized effluent concentration limits are not appropriate for use as short-term benchmark water quality guidelines. The Schedule 4 limits are only applicable to effluent and represent concentrations in effluent that cannot be exceeded at end-of-pipe, not to receiving environment surface water concentrations, and are not a reliable indicator of acutely lethal concentrations of constituents in receiving environment surface water.</p> <ul style="list-style-type: none"><li>• Tables 8.2-8 and 8.2-10: A) Temperature: long-term screening criteria is “ambient temp” and should be updated to “narrative”, as has been used in updated Tables 8.2-2. The narrative is already included in the footnotes of Table 8.2-8 and 8.2-10, so the tables should be updated as well.</li><li>• Table 8.2-13: A) Cadmium: both short-and long-term benchmarks are erroneous and should be corrected to values found in updated Table 8.2-2. B) Chloride: long-term benchmark is erroneous and should be corrected to value found in updated Table 8.2-2. C) Iron, Lead-210, and Uranium-234 &amp; -238: long-term benchmarks are missing and should be the same values found in updated Table 8.2-2 or Table 8.2-8. Alkalinity and nitrate have been added to the table as requested, however predicted maximum concentrations are only presented for Whitefish Lake Middle and South. The proponent should describe why there are no estimates for these parameters in other lakes, and how they intend to fill these gaps.</li></ul> <p>•Table 8.2-14:</p> <p>A.The removal of constituents of potential concern from future centuries review need to be justified by the proponent. Otherwise, all parameters included in Table 8.2-13 should also be included in Table 8.2-14. Presently alkalinity, nitrate, uranium-234 &amp; -238 are missing.</p> <p>B.Uranium: the long-term screening concentration is erroneous and should be corrected to the value found in all other tables.</p> <p>•Footnotes:</p> <p>A.The footnotes for each table should reflect what is in the table.</p> <p>B.All tables: acronyms used in the references that need explanations in the footnotes include: “CCME”, “HC”, “BC MOE”, “FEQG” and “MDMER”.</p> <p>C.All tables: explanations in the footnotes for acronyms that were not used in the tables: “SSWQO”, “TKN”, and “TOC”.</p>	<p>1) The updates were completed as requested. In Table 8.2-13 MDMER Schedule 4 maximum authorized effluent limits were removed and tables updated.</p> <p>Tables 8.2-8 and 8.2-10</p> <p>A) Table were updated to include “narrative” rather than “ambient temp” as requested.</p> <p>Table 8.2-13:</p> <p>A) Cadmium values were checked and were correct, however, chloride values were incorrect and had the cadmium footnote associated with them. This was corrected.</p> <p>B) Chloride long term benchmark was corrected to the value found in Table 8.2-2.</p> <p>C) Iron, Lead-210 and Uranium-234 and Uranium-238 long-term benchmarks were missing but have been added as per the values consistent with Table 8.2-2 and 8.2-8.</p> <p>D) Alkalinity and nitrate were not collected for other locations during baseline assessments. It is intended that these constituents will be added to the pre-construction water sampling suite of parameters to ensure consistency and completeness for additional analysis conducted for licencing.</p> <p>Table 8.2-14</p> <p>A) <b>Nitrate:</b> Nitrate was not included in the Geochemical Reactive Transport Model (Appendix 7C of the Final EIS) as it is not considered a COPC associated with the ISR mining process for this project. Nitrate concentrations were below laboratory reported detection limits in the metallurgical testing, where tested, as shown in Table F-2 of Appendix 7C of the EIS. Further, nitrate concentrations are, with one exception for a groundwater monitoring well in overburden (GWR-036), below or very close to the laboratory reported detection limit, as shown in Table D-2 of Appendix 7C of the Final EIS. Baseline nitrate concentrations are low ( &lt; 0.5 mg/L) in surface water bodies assessed for the</p>

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, July 5, 2024)	IR (ROUND 4, Sept. 6, 2024)	Denison Response (ROUND 4, October 15 2024)
							<ul style="list-style-type: none"> <li>Alkalinity and nitrate have been added to the table as requested, however predicted maximum concentrations are only presented for Whitefish Lake Middle and South. The proponent should describe why there are no estimates for these parameters in other lakes, and how they intend to fill these gaps.</li> <li>Un-ionized ammonia appears in two separate lines in the table with concentrations differing by 3-4 orders of magnitude and different screening values. A single line entry with accurate values should be retained. The Proponent should provide an explanation for the error in order to give the reviewer confidence that the correct values are retained.</li> <li>The column with screening values does not always use the most conservative value from Table 8.2-8. See comment IR-115 for request to provide justifications.</li> </ul> <p>Table 8.2-14 should be updated with corrections to screening criteria necessary for this IR as well as for IR-108 and IR-115. Additional follow up for Table 8.2-10 can be found under IR-108 and IR-108-R1.</p> <p>In the Proponent’s response to item three of the IR, Table 8.2-10 is missing the source for the short-term screening criteria value for arsenic. The Proponent should update Table 8.2-10 to include the source for the short-term screening criteria value for arsenic.</p>		<p>Removing these would increase clarity. D. Footnote “*” should be removed. It explains how ammonia concentration is calculated and is not referred to in Tables 8.2-8, 8.2-10 &amp; 8.2-13. In Table 8.2-14 it is associated by cadmium, which does not make sense. E. Footnote (4) should be removed. It states the short-term screening criterion for chloride limit is “<i>Based on water hardness &gt;0 to &lt;17 mg/L</i>”. This appears erroneous since neither the CCME guideline nor the SEQG is hardness based. F. Tables 8.2-13 &amp; 8.2-14 do not refer to the footnotes “TDS”, “narrative”, (4) and (7), and removing them would help clarity.</p> <p>2) CNSC/ECCC staff agree that the minor baseline exceedances of copper concentrations in water do not constitute the use of a guideline that is a magnitude of order greater than the copper FEQG. The copper FEQG guideline is the most restrictive guideline and based on current science and site-specific conditions, whereas the CCME guideline is quite dated and does not incorporate the use of site-specific environmental modifying factors. As there are background concentrations of copper that do exceed the copper FEQG, there is the potential that biota may already be stressed due to these exceedances. However, there is not currently enough baseline characterization data within the immediate receiving environment to conclude the level of risk to receptors and if there are consistent exceedances of water quality guidelines. Following the principles of the Precautionary Approach, to be conservative Denison are expected to:</p> <p>A) Update the screening criteria used for the EIS and ERA (and all relevant tables) to utilize the more stringent FEQG guideline of 0.0002 mg/L as calculated using the currently available baseline data.</p> <p>B) Update the ERA effects assessment for copper to utilize the FEQG with regards to selected Toxicity Reference Values (TRVs) and risk characterization to receptors.</p> <p>C) Collect further baseline data in the immediate receiving environment (LA-5) to adequately characterize copper concentrations in water and sediment quality and any potential exceedances of baseline water quality guidelines.</p>	<p>project, as reported in Table 8.2.2 of Chapter 8 of the final EIS. Nitrate concentrations are thus expected to remain at baseline levels in future centuries. A note has been added to Table 8.2-14 to indicate that nitrate is not a COPC in the future centuries and as such is expected to remain at baseline levels.</p> <p><b>Alkalinity:</b> was included in the Geochemical Reactive Transport Model (Appendix 7C of the Final EIS) but not included in the future centuries assessment in IMPACT. Using the output from the geochemical reactive transport model (i.e., the mass flux of alkalinity, reported as “C” in Table 4-4 of Appendix 7C of the Final EIS), the approach and input parameters used in the IMPACT model (described in Appendix A to Appendix 10-A of the Final EIS), and assuming that alkalinity (as bicarbonate ion primarily at the circumneutral pH value Whitefish Lake) does not interact with the sediments, maximum alkalinity values in Whitefish Lake (LA-5) were calculated to be 8.1 mg/L as CaCO3 versus the mean baseline value of 7.7 mg/L as CaCO3 (Table 8.2-2 of Chapter 8 of the Final EIS). This value has been included in Table 8-2.14, is within the range of baseline alkalinity values observed in that lake (3-15 mg/L as CaCO3 in Whitefish Lake South (LA-5)) and represents a 5.2 % increase from mean baseline concentrations. The alkalinity in the future centuries was not calculated for the other lakes as changes with respect to baseline conditions will be negligible (i.e., not outside of the range of values in each lake observed at baseline). <b>U-234 and U-238:</b> Uranium was modelled in the future centuries scenario and U-234 and U-238 (Bq/L) were calculated. The results have been added to Table 8.2-14.</p> <p>B) Uranium long-term screening value was</p>

										<p>updated to be consistent with all other tables</p> <p>Footnotes:</p> <p>A) Footnotes for each table have been updated</p> <p>B) All table acronyms have been explained as applicable.</p> <p>C) Acronyms that were not used in a table were removed from the footnotes</p> <p>D) “*” has been removed from the document where explaining ammonia concentration calculation.</p> <p>E) Confirmed that this statement was correct. Footnote 4 was removed from all tables, and all footnote numbering adjusted to reflect changes.</p> <p>F) TDS and “Narrative” footnotes were removed. Footnote 7 was missing in the table, so was added. Footnote 4 removed from all tables.</p> <p>2)</p> <p>A) The screening criteria used for the EIS and ERA (and all relevant tables) has been updated to utilize the more stringent FEQG guideline of 0.0002 mg/L. See Attachment IR-114 Round 4.</p> <p>B) The TRVs have been re-evaluated using the FEQG Biotic Ligand Model. See Attachment IR-114 Round 4.</p> <p>C) Denison is committed to collection of further baseline data in the immediate receiving environment (LA-5) to adequately characterize copper concentrations in water (refer to response to Round 4 IR-107 for water quality results from Whitefish Lake from June to September 2024) and sediment quality and any potential exceedances of water quality guidelines and this information will be further presented and analyzed as part of licencing.</p>

## **Attachment: IR-114 (included in Round 1 Submission)**

1) Please see updated Tables 8.2-9 and 8.2-10 from the draft EIS below. Water quality predictions for the well mixed portion of LA-5 for each of the three flow scenarios (described in Section 8.2.4.2.3 and Table 8.2-7 of the draft EIS) are provided in the updated Table 8.2-10 below. Predicted site discharge concentrations that exceed respective receiver WQOs are bolded. Chloride, sulphate, TDS, arsenic, cadmium, chromium, cobalt, copper, selenium, and uranium, thorium-230, radium-226, lead-210, and polonium-210 predicted discharge concentrations are above receiver WQOs. However, under all three flow scenarios, the predicted water quality for all constituents is below respective WQOs within the well mixed portion of LA-5, indicating that sufficient dilution is present within LA-5 to meet objectives. Updated Table 8.2-13 is provided below. Water quality predictions have been added for MDMER constituents listed under Schedule 4 and Schedule 5. There are no predicted exceedances of water quality guidelines for any of the COPCs during Construction, Operation, or Decommissioning

2) The predictive water quality analysis considered the effects of toxicity modifying factors, such as hardness, on water quality. Specifically, the analysis considered induced hardness - that is hardness that is derived from or includes contributions from on site sources and in this case discharge from the IWWTP. It is a reasonable in this case to utilize induced hardness since the water quality assessment directly considers the potential effect of IWWTP discharge on the receiving environment. The hardness added to the receiver from the discharge represents a constant source during periods of discharge. The effluent hardness value used in the analysis was derived from bench scale testing and is considered to be a reasonable estimate of expected hardness in effluent. With that in mind, the predictive water quality analysis reflects the water quality conditions that are anticipated to prevail in the receiver and therefore presents an appropriate platform on which to base the effects assessment.

3) The table below (IR-114 Table 1) shows a summary of baseline concentrations of total mercury in surface water within the LSA. Sediment was not analyzed for mercury during previous baseline surveys. Baseline water quality in the LSA and RSA showed no indication of total mercury present above detectable limits and as such, the potential for methyl-mercury to be detected was unlikely. Generally, 60 to 95% of total mercury concentrations in fish muscle tissues are present in the form of methyl-mercury. Table 8.5-2 of Section 8.5 of the EIS provides a full summary of tissue constituent concentrations for key species from the Icelder River and Russell Lake. A conservative approach of assuming 95% of mercury in the tissues is present in the methylated form could be used for comparative purposes. These data supplemented with more current baseline data for water, sediment and fish tissues specific to total and methyl-mercury prior to the onset of site development will provide a robust database for comparative purposes during the subsequent development and operation on site.

4) Consistent with CSA N288.1-20, Clause 5.1.5, atmospheric depositions to large water bodies such as lakes, are considered negligible; therefore, the air to surface water pathway has been excluded for the ecological risk assessment. The rationale for exclusion of atmospheric deposition to lakes and rivers is explained in detail in Section G9, Appendix G of the COG DRL Guidance Document (Hart, 2019). Typical transfer parameters from source to air and source to water are on a similar magnitude to each other. The transfer parameter from air to water is orders of magnitude lower indicating that atmospheric deposition to the lake would have a negligible effect. Rationale on the exclusion of the air to water pathway can be included in the ERA in Appendix 10-A. The

following statement will be added to Section 2.2 in Appendix A to Appendix 10-A "Atmospheric deposition to Whitefish Lake is considered negligible. This is consistent with the COG DRL guidance (COG, 2019) which shows (assuming a modest flow rate for a lake of 0.1 m/s and an assumed water depth of 10 m) that the transfer of constituents from the atmosphere to large bodies of water (including lakes and rivers) is considered negligible."

As baseline surface water did not identify measurable concentrations of total mercury in the LSA or RSA (See IR-114 Table 1 below) and deposition to large water bodies such as lakes is not likely to contribute to the methyl mercury concentration in the Wheeler River receiving waters, it is most reasonable to conclude that changes in total and methyl mercury can be adequately monitored in relation to sulphate inputs. Denison will undertake monitoring of total and methyl mercury as it relates to the discharge of sulphate to Whitefish Lake.

Notes:

- (1) Saskatchewan Water Quality Objectives, SEQG on-line (<https://envrbrportal.crmp.saskatchewan.ca/seqg-search/>), SEQG for the protection of aquatic life were selected, based on total concentrations, a temperature of 15°C and a pH of 7.0.
- (2) Hardness dependent WQOs are for very soft water (hardness <25 mg CaCO<sub>3</sub>/L). Site-specific hardness is 5.26 mg/L (95th percentile of LA-5 and LA-6).
- (3) Scientific Criteria Document for the Development of the Canadian Water Quality Guidelines for the Protection of Aquatic Life - Manganese, Appendix B - Canadian Water Quality Guidelines Calculator (pH = 7.5, hardness = 15 mg/L). Guideline is based on dissolved manganese. Benchmark = exp(0.878[ln(hardness)] + 4.76) where the benchmark is expressed in dissolved manganese concentration (µg/L), and hardness is measured as CaCO<sub>3</sub> equivalents in mg/L.
- (4) Total ammonia-N calculated from the total ammonia guideline for a temperature of 15°C and a pH of 7.0, Un-ionized Ammonia from Table 1 of temperature and pH Canadian Water Quality Guidelines for the Protection of Aquatic Life - Ammonia (<https://ccme.ca/en/res/ammonia-en-canadian-water-quality-guidelines-for-the-protection-of-aquatic-life.pdf>)
- (5) Based on a pH of >6.5.
- (6) Based on water hardness >0 to <17 mg/L.
- (7) Based on water hardness >0 to <82 mg/L.
- (8) Based on water hardness >0 to ≤60 mg/L equation used at hardness of 5.26. At hardness >180 mg/L, the CWQG is 7 µg/L
- (9) Guideline is based on dissolved zinc.
- (10) Environment Canada 2017. Federal Environmental Quality Guidelines, Cobalt, May. Based on equation and site-specific baseline hardness of 15 mg/L.
- (11) ECCC 2020. Federal Environmental Quality Guidelines Strontium. July.

(15) BC MECCS 2020. Source Drinking Water Quality Guidelines, Guideline Summary Ministry of Environment & Climate Change Strategy Water Protection & Sustainability Branch .

(16) WHO 2017. Guidelines for Drinking Water Quality. Fourth Edition Incorporating The First Addendum.

(17) Framework - guideline for meso-eutrophic waterbody 20-35 µg/L

(18) Based on water hardness of >0 to <5.3 mg/L

(19) Based on hardness of 5 mg/L (Short-term equation is  $(e^{[0.979123[\ln(\text{hardness})]-8.64497}]) * 1000$  (SEQQ via AEP 1996b)

(20) Based on benchmark =  $\exp(0.833[\ln(\text{hardness mg}\cdot\text{L}^{-1})] + 0.240[\ln(\text{DOC mg}\cdot\text{L}^{-1})] + 0.526)$ . Site-specific background hardness is 5.26 mg/L (95th percentile of LA-5 and LA-6). Site-specific DOC is 2.2 (arithmetic mean for LA-5 and LA-6), induced hardness of 250.5 used as upper limit of extrapolation available.

(21) based on water hardness of > 250 mg/L (CaCO<sub>3</sub>) (251 mg/L)

(22) MDMA Schedule 4 - maximum authorized monthly mean concentration

(23) Bold numbers indicate exceedance of long-term criteria

SEQG – Saskatchewan Environmental Quality Guidelines – Water Quality Guidelines for Freshwater Aquatic Life.

CWQG – Canadian Council of Ministers of the Environment – Canadian Water Quality Guidelines for the Protection of Aquatic Life.

SSWQO – Saskatchewan Surface Water Quality Objectives.

DOC – Dissolved organic carbon.

TDS – Total dissolved solids.

TKN – Total Kjeldahl Nitrogen.

TOC – Total organic carbon.

TSS – Total suspended solids.

Notes

Notes

Estimates of mercury concentration are based on 50% of the detection limit in both background and effluent.

(1) Estimated from near-field model

NE = No estimate for this lake for this parameter

Saskatchewan Water Quality Objectives, SEQG on-line (<https://envrbrportal.crmf.saskatchewan.ca/seqg-search/>), SEQG for the protection of aquatic life were selected, based on total concentrations, a temperature of 15°C and a pH of 7.0.

Hardness dependent WQOs are for very soft water (hardness <25 mg CaCO<sub>3</sub>/L). Site-specific hardness is 5.26 mg/L (95th percentile of LA-5 and LA-6).

(4) Total ammonia-N calculated from the total ammonia guideline for a temperature of 15°C and a pH of 7.0, Un-ionized Ammonia from Table 1 of temperature and pH Canadian Water Quality Guidelines for the Protection of Aquatic Life - Ammonia (<https://ccme.ca/en/res/ammonia-en-canadian-water-quality-guidelines-for-the-protection-of-aquatic-life.pdf>)

(5) Based on a pH of >6.5.

(6) Based on water hardness >0 to <17 mg/L.

(7) Based on water hardness >0 to <82 mg/L.

(8) Based on water hardness >0 to ≤60 mg/L equation used at hardness of 5.26. At hardness >180 mg/L, the CWQG is 7 µg/L

(9) Guideline is based on dissolved zinc.

Notes:

All parameters listed as total concentrations unless otherwise specified

Saskatchewan Water Quality Objectives, SEQG on-line (<https://envrbrportal.crm.p.saskatchewan.ca/seqg-search/>), SEQG for the protection of aquatic life were selected, based on total concentrations

Bold numbers indicate exceedance of long-term criteria

Bold and italicized indicate exceedance of short-term criteria and long-term criteria.

SEQG – Saskatchewan Environmental Quality Guidelines – Water Quality Guidelines for Freshwater Aquatic Life.

CWQG – Canadian Council of Ministers of the Environment – Canadian Water Quality Guidelines for the Protection of Aquatic Life.

SSWQO – Saskatchewan Surface Water Quality Objectives.

DOC – Dissolved organic carbon.

TDS – Total dissolved solids.

TKN – Total Kjeldahl Nitrogen.

TOC – Total organic carbon.

TSS – Total suspended solids.

Narrative – Temperature - Maximum Weekly Average Temperature: Thermal additions to receiving waters should be such that the maximum weekly average temperature is not exceeded. Short-term Exposure to Extreme Temperature: Thermal additions to receiving waters should be such that the short-term exposures to maximum temperatures are not exceeded. Exposures should not be so lengthy or frequent as to adversely affect the important species.

- \* A pH of 7 and a temperature of 15°C were assumed to convert total ammonia to un-ionized ammonia in accordance with CCME (2002).
- (1) Long-term criterion for aluminum based on CCME/SEQG of 0.1 mg/L for dissolved aluminum when pH is greater than 6.5.

(2) Total ammonia-N calculated from the total ammonia guideline for an average annual temperature of 15°C and a pH of 7.0, Un-ionized Ammonia from Table 1 of temperature and pH, Canadian Water Quality Guidelines for the Protection of Aquatic Life - Ammonia (<https://ccme.ca/en/res/ammonia-en-canadian-water-quality-guidelines-for-the-protection-of-aquatic-life.pdf>).

(3) Based on water hardness of >0 to <5.3 mg/L (Site-specific background hardness is 5.26 mg/L (95th percentile of LA-5 and LA-6).

(4) Based on water hardness >0 to <17 mg/L.

(5) Guideline specific to Chromium VI for conservative comparison to baseline water quality

(6) Based on hardness of 5.26 mg/L (Short-term equation is (e<sup>(0.979123[ln(hardness)]-8.64497)</sup>)\*1000 (SEQQ via AEP 1996b)

(7) Federal Water Quality Guideline for Copper Biotic Ligand Model (BLM) Tool and User Manual, (Site-specific background hardness is 5.26 mg/L, DOC is 2.24 mg/L, pH is 6.61 (95th percentile of LA-5 and LA-6)

(8) Short Term Guideline is based on dissolved manganese. Benchmark = exp(0.878[ln(hardness)] + 4.76) where the benchmark is expressed in dissolved manganese concentration (µg/L), and hardness is measured as CaCO3 equivalents in mg/L. (Site-specific hardness is 5.26 mg/L (95th percentile of LA-5 and LA-6).

(9) Long-term guideline for manganese based on Scientific Criteria Document for the Development of the Canadian Water Quality Guidelines for the Protection of Aquatic Life - Manganese, Appendix B - Canadian Water Quality Guidelines Calculator (pH = 6.61, hardness = 5.26 mg/L.

(10) Framework provides Trigger Ranges for Total Phosphorus (µg/L) - guideline for oligotrophic waterbody 4 - 10 µg/L

(11) MDMER Schedule 4 - maximum authorized monthly mean concentration

(12) Guideline is based on dissolved zinc.

(13) Short term guideline is based on Benchmark = exp(0.833[ln(hardness mg·L-1)] + 0.240[ln(DOC mg·L-1)] + 0.526). (Site-specific background hardness is 5.26 mg/L, DOC is 2.24 mg/L, pH is 6.61 (95th percentile of LA-5 and LA-6). Note – extrapolated for value outside the hardness range.

(14) Long term guideline is based on CWQG = exp(0.947[ln(hardness mg·L-1)] - 0.815[pH] + 0.398[ln(DOC mg·L-1)] + 4.625). (Site-specific background hardness is 5.26 mg/L, DOC is 2.24 mg/L, pH is 6.61 (95th percentile of LA-5 and LA-6). Note – extrapolated for value outside the hardness range.

(15) Environment Canada 2017. Federal Environmental Quality Guidelines, Cobalt, May. Based on equation and lowest hardness for equation of 52 mg/L

(16) Environment Canada 2017. Federal Environmental Quality Guidelines, Cobalt. Based on equation and hardness of 250 mg/L for equation of FWQG =  $\exp\{((0.414[\ln(\text{hardness})] - 1.887)\}$ .

Table 8.2-10: Near-field Receiving Water Quality Results

Parameter	Units	Short-term Screening Criteria (background hardness)	Short-term Screening Criteria (Hardness induced [>250 mg/L])	Source	Note	Long-term Screening Criteria (background hardness)	Long-term Screening Criteria (Hardness induced [>250 mg/L])	Source	Note	Discharge Concentration (max predicted)	LA-5 Well Mixed (7Q10)	LA-5 Well Mixed (Monthly Low)	LA-5 Well Mixed (Average)

Notes:

All parameters listed as total concentrations unless otherwise specified

Saskatchewan Water Quality Objectives, SEQG on-line (<https://envrbrportal.crmf.saskatchewan.ca/seqg-search/>), SEQG for the protection of aquatic life were selected, based on total concentrations

Bold numbers indicate exceedance of long-term criteria

Bold and italicized indicate exceedance of short-term criteria and long-term criteria.

SEQG – Saskatchewan Environmental Quality Guidelines – Water Quality Guidelines for Freshwater Aquatic Life.

CWQG – Canadian Council of Ministers of the Environment – Canadian Water Quality Guidelines for the Protection of Aquatic Life.

SSWQO – Saskatchewan Surface Water Quality Objectives.

DOC – Dissolved organic carbon.

TDS – Total dissolved solids.

TKN – Total Kjeldahl Nitrogen.

TOC – Total organic carbon.

TSS – Total suspended solids.

Narrative – Temperature - Maximum Weekly Average Temperature: Thermal additions to receiving waters should be such that the maximum weekly average temperature is not exceeded. Short-term Exposure to Extreme Temperature: Thermal additions to receiving waters should be such that the short-term exposures to maximum temperatures are not exceeded. Exposures should not be so lengthy or frequent as to adversely affect the important species.

\* A pH of 7 and a temperature of 15°C were assumed to convert total ammonia to un-ionized ammonia in accordance with CCME (2002).

(1) Long-term criterion for aluminum based on CCME/SEQG of 0.1 mg/L for dissolved aluminum when pH is greater than 6.5.

(2) Total ammonia-N calculated from the total ammonia guideline for an average annual temperature of 15°C and a pH of 7.0, Un-ionized Ammonia from Table 1 of temperature and pH, Canadian Water Quality Guidelines for the Protection of Aquatic Life - Ammonia (<https://ccme.ca/en/res/ammonia-en-canadian-water-quality-guidelines-for-the-protection-of-aquatic-life.pdf>).

(3) Based on water hardness of >0 to <5.3 mg/L (Site-specific background hardness is 5.26 mg/L (95th percentile of LA-5 and LA-6).

(4) Based on water hardness >0 to <17 mg/L.

(5) Guideline specific to Chromium VI for conservative comparison to baseline water quality

(6) Based on hardness of 5.26 mg/L (Short-term equation is (e<sup>[0.979123[ln(hardness)]]-8.64497]</sup>)\*1000 (SEGQ via AEP 1996b)

(7) Federal Water Quality Guideline for Copper Biotic Ligand Model (BLM) Tool and User Manual, (Site-specific background hardness is 5.26 mg/L, DOC is 2.24 mg/L, pH is 6.61 (95th percentile of LA-5 and LA-6)

(8) Short Term Guideline is based on dissolved manganese. Benchmark = exp(0.878[ln(hardness)] + 4.76) where the benchmark is expressed in dissolved manganese concentration (µg/L), and hardness is measured as CaCO3 equivalents in mg/L. (Site-specific hardness is 5.26 mg/L (95th percentile of LA-5 and LA-6).

(9) Long-term guideline for manganese based on Scientific Criteria Document for the Development of the Canadian Water Quality Guidelines for the Protection of Aquatic Life - Manganese, Appendix B - Canadian Water Quality Guidelines Calculator (pH = 6.61, hardness = 5.26 mg/L.

(10) Framework provides Trigger Ranges for Total Phosphorus (µg/L) - guideline for oligotrophic waterbody 4 - 10 µg/L

(11) MDMER Schedule 4 - maximum authorized monthly mean concentration

(12) Guideline is based on dissolved zinc.

- (13) Short term guideline is based on Benchmark =  $\exp(0.833[\ln(\text{hardness mg}\cdot\text{L}^{-1})] + 0.240[\ln(\text{DOC mg}\cdot\text{L}^{-1})] + 0.526)$ . (Site-specific background hardness is 5.26 mg/L, DOC is 2.24 mg/L, pH is 6.61 (95th percentile of LA-5 and LA-6). Note – extrapolated for value outside the hardness range.
- (14) Long term guideline is based on CWQG =  $\exp(0.947[\ln(\text{hardness mg}\cdot\text{L}^{-1})] - 0.815[\text{pH}] + 0.398[\ln(\text{DOC mg}\cdot\text{L}^{-1})] + 4.625)$ . (Site-specific background hardness is 5.26 mg/L, DOC is 2.24 mg/L, pH is 6.61 (95th percentile of LA-5 and LA-6). Note – extrapolated for value outside the hardness range.
- (15) Environment Canada 2017. Federal Environmental Quality Guidelines, Cobalt, May. Based on equation and lowest hardness for equation of 52 mg/L
- (16) Environment Canada 2017. Federal Environmental Quality Guidelines, Cobalt. Based on equation and hardness of 250 mg/L for equation of FWQG =  $\exp\{(0.414[\ln(\text{hardness})] - 1.887)\}$ .

(12) Guideline is based on dissolved zinc.

(13) Short term guideline is based on Benchmark = exp(0.833[ln(hardness mg-L-1)] + 0.240[ln(DOC mg-L-1)] + 0.526). (Site-specific background hardness is 5.26 mg/L, DOC is 2.24 mg/L, pH is 6.61 (95th percentile of LA-5 and LA-6). Note – extrapolated for value outside the hardness range.

(14) Long term guideline is based on CWQG = exp(0.947[ln(hardness mg-L-1)] - 0.815[pH] + 0.398[ln(DOC mg-L-1)] + 4.625). (Site-specific background hardness is 5.26 mg/L, DOC is 2.24 mg/L, pH is 6.61 (95th percentile of LA-5 and LA-6). Note – extrapolated for value outside the hardness range.

(15) Environment Canada 2017. Federal Environmental Quality Guidelines, Cobalt, May. Based on equation and lowest hardness for equation of 52 mg/L.

## Attachment IR-114 (Round 4)

Part 2 of IR-114 (Round 4) requested that Denison use the copper Federal Environmental Quality Guideline (FEQG). The copper FEQG guideline is the most restrictive guideline and based on current science and incorporates the use of site-specific environmental modifying factors.

A)

Baseline conditions for the Wheeler River include a background hardness of 5.26 mg/L, DOC of 2.24 mg/L, and pH of 6.61 (95th percentile of LA-5 and LA-6). Using ECCC's Biotic Ligand Model for copper, the calculated HC<sub>5</sub> is below 0.0002 mg/L, however, 0.0002 mg/L is considered by the FEQG to be the lowest concentration routinely measured and therefore replaces the calculated HC<sub>5</sub> value for this water chemistry. Therefore, at baseline conditions the FEQG is 0.0002 mg/L.

Table 3-1, Table 3-3, and Table 3-5 of the ERA (Appendix 10-A) were updated to include the copper FEQG of 0.0002 mg/L as the screening criterion. Likewise, Tables 8.2-2, 8.2-3, 8.2-10, 8.2-13 and 8.2-14 in Section 8 of the EIS were updated to include the copper FEQG of 0.0002 mg/L as the screening criteria.

B)

As identified in Section 5.3.1.1 of the ERA (Appendix 10-A), toxicity reference values (TRVs) for copper were obtained from the USEPA Ecotoxicology Database (ECOTOX) for aquatic organisms. The selected TRVs were 20% Effect Concentrations (i.e., EC<sub>20</sub> values), which are concentrations at which only 20% of the test organisms respond. The TRVs are shown in Table IR-114-1 below. Where the TRVs derived from ECOTOX were lower than the CCME guideline the CCME guideline was selected.

**Table IR-114-1: Copper Toxicity Reference Values Used for Aquatic Organisms in the ERA**

COPC	Biotic Group	TRV	Unit	Rationale	Data Source
<b>Copper</b>	Forage fish	0.002	mg/L	5th percentile of estimated chronic EC <sub>20</sub> distribution (n=237)	ECOTOX
	Predator fish	0.003	mg/L	5th percentile of estimated chronic EC <sub>20</sub> distribution (n=89)	ECOTOX
	Zooplankton	0.002	mg/L	5th percentile of estimated chronic EC <sub>20</sub> distribution (n=117)	ECOTOX; CCME
	Benthic invertebrates	0.002	mg/L	5th percentile of estimated chronic EC <sub>20</sub> distribution (n=264)	ECOTOX; CCME
	Phytoplankton	0.0092	mg/L	5th percentile of estimated chronic EC <sub>20</sub> distribution (n=101)	ECOTOX
	Aquatic plants	0.038	mg/L	5th percentile of estimated chronic EC <sub>20</sub> distribution (n=28)	ECOTOX

As requested in IR-114, the TRVs have been re-evaluated using the FEQG and the BLM. The BLM was run based on baseline site-specific conditions. The test species and concentrations identified as used to generate the BLM were evaluated to develop TRVs for the applicable biotic groups. The most restrictive effect concentration for each biotic group was identified. The test endpoint was either an EC<sub>10</sub> or an IC<sub>10</sub>. Based on the protocol identified in Table 5-11 of the ERA, the EC<sub>10</sub> (or IC<sub>10</sub>) was multiplied by 2 to obtain an EC<sub>20</sub>, which was then utilized as the TRV. A summary of the TRVs for baseline conditions is identified in Table IR-114-2.

Considering that while the facility is in operation it is expected that hardness will increase to approximately 250 mg/L and pH will increase to approximately 7, the BLM was re-run under updated site conditions and the TRVs were re-evaluated based on the test species and concentrations used to generate the BLM. The copper TRVs under site conditions are presented in Table IR-114-3.

**Table IR-114-2: Copper Toxicity Reference Values from Baseline Conditions BLM**

COPC	Biotic Group	TRV	Unit	Rationale	Data Source
<b>Copper</b>	Forage fish	0.0052	mg/L	Fathead minnow, growth (IC <sub>10</sub> = 0.0026 mg/L)	FEQG BLM
	Predator fish	0.0008	mg/L	White sturgeon, growth (EC <sub>10</sub> = 0.0004 mg/L)	FEQG BLM
	Zooplankton	0.0009	mg/L	Daphnia magna, reproduction (EC <sub>10</sub> = 0.0004 mg/L)	FEQG BLM
	Benthic invertebrates	0.0004	mg/L	Pond snail, growth (EC <sub>10</sub> = 0.0002 mg/L)	FEQG BLM
	Phytoplankton	0.0091	mg/L	Rotifer, intrinsic (EC <sub>10</sub> = 0.0046 mg/L)	FEQG BLM

	Aquatic plants	0.0212	mg/L	Duckweed, root length (EC <sub>10</sub> = 0.01 mg/L)	FEQG BLM
--	----------------	--------	------	--	----------

Notes:

BLM based on hardness of 5.26 mg/L, DOC of 2.24 mg/L, pH of 6.61, temperature of 13°C.

TRV is an EC<sub>20</sub>, adjusted from an EC<sub>10</sub> or IC<sub>10</sub>.

**Table IR-114-3: Copper Toxicity Reference Values from Site Conditions BLM**

COPC	Biotic Group	TRV	Unit	Rationale	Data Source
<b>Copper</b>	Forage fish	0.025	mg/L	Fathead minnow, growth (IC <sub>10</sub> = 0.012 mg/L)	FEQG BLM
	Predator fish	0.005	mg/L	White sturgeon, growth (EC <sub>10</sub> = 0.002 mg/L)	FEQG BLM
	Zooplankton	0.005	mg/L	Daphnia magna, reproduction (EC <sub>10</sub> = 0.003 mg/L)	FEQG BLM
	Benthic invertebrates	0.003	mg/L	Pond snail, growth (EC <sub>10</sub> = 0.001 mg/L)	FEQG BLM
	Phytoplankton	0.040	mg/L	Rotifer, intrinsic (EC <sub>10</sub> = 0.02 mg/L)	FEQG BLM
	Aquatic plants	0.014	mg/L	Duckweed, root length (EC <sub>10</sub> = 0.007 mg/L)	FEQG BLM

Notes:

BLM based on hardness of 250 mg/L, DOC of 2.24 mg/L, pH of 7, temperature of 13°C.

TRV is an EC<sub>20</sub>, adjusted from an EC<sub>10</sub> or IC<sub>10</sub>.

The hazard quotients (HQs) for aquatic organisms were re-evaluated using both sets of TRVs, baseline conditions and site conditions during operation where hardness and pH are increased (Table IR-114-4). Consistent with Section 5.4.1 of the ERA (Appendix 10-A) an HQ less than or equal to 1 suggests low risk to the ecological receptor, and an HQ above 1 needs further investigation to determine if adverse effects are possible. Conservatively using baseline conditions, HQs for all aquatic organisms are less than 1 with the exception of predator fish in Whitefish Lake, and benthic invertebrates at all locations where HQs are slightly above 1. As such, further consideration was given to changes in site conditions when the facility is in operation. Using more realistic site conditions for hardness and pH, HQs for all aquatic organisms are less than 1 at all locations, indicating no adverse effects to aquatic organisms from facility related copper. It is relevant to consider all aspects of the receiving environment and this includes induced hardness since the scenario being evaluated only occurs during periods of effluent discharge. This approach is used in other jurisdictions (e.g., water licences in northern Canada issued through local water boards) and therefore the concept of induced hardness is not unique.

The copper predictions in the ERA are considered conservative based on the following assumptions:

- Baseline concentrations of copper are predominantly below the detection limit, indicating that baseline concentrations of copper are likely overestimated in the ERA.
- The effluent predictions in the ERA are based on available information from test studies at the time the ERA was prepared. Denison will be refining the effluent quality through the BATEA assessment and licensing process.
- Based on the effluent quality and quantity released to Whitefish Lake, the maximum copper concentration in Whitefish Lake and downstream waterbodies was evaluated as part of the HQ. This is a conservative assumption.
- Once the facility is operational, site conditions will change which includes increased hardness and pH; therefore, the predicated HQs under baseline conditions are considered conservative and overestimate risk.

Denison is in the process of collecting additional baseline water quality data which will be used in future ERA iterations to reconsider the baseline copper concentration in the Wheeler River. The ERA is a living document that will continue to be updated at defined intervals and will integrate new data when it is available. Denison has also committed to an ongoing environmental monitoring program which will be used to determine if there are any adverse effects to aquatic organisms from copper and other constituents of potential concern.

**Table IR-114-4: Re-Evaluated Hazard Quotients for Copper in Aquatic Organisms**

Location	Maximum Copper Concentration in Water (mg/L)	Hazard Quotients (unitless) – Baseline Conditions						Hazard Quotients (unitless) – Site Operation Conditions

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, June 28, 2024)	IR (ROUND 4, Sept. 6 2024)	Denison Response (ROUND 4 October 15, 2024)																																															
IR- 126	-	<p><b>Context:</b> The Proponent has used the US Environmental Protection Agency (US EPA) guidelines for the assessment of selenium fish tissue concentrations in Section 8.5.3 of the draft EIS and in the Environmental Risk Assessment (ERA) in Appendix 10-A (ERA) of Section 10.</p> <p><b>Rationale:</b> ECCC’s Federal Environmental Quality Guidelines of 6.7 ug/g dry weight fish whole body tissue for selenium should be used, as it is more protective than the US EPA guidelines.</p>	Update the selenium fish tissue assessment in the draft EIS and the Wheeler River ERA (Appendix 10-A (ERA) in Section 10) as needed using ECCC’s FEQG.	Denison is aware of the ECCC Federal Environmental Quality Guideline for selenium in fish. The ECCC FEQG is for fish tissue egg-ovary and whole-body. Denison selected the US EPA guideline over the ECCC guideline since US EPA provides guidelines for fish tissue muscle as well. The fish assessed in the ERA were large-bodied fish including northern pike and white sucker. A fish tissue muscle TRV is appropriate for assessment of large-bodied fish; therefore, the US EPA selenium fish tissue muscle benchmark was preferred over the whole body value from ECCC.	<p>ECCC acknowledges that the Proponent prefers the use of the US EPA guidelines due to the ability to perform fish tissue muscle TRV, however, Environmental Effects Monitoring (EEM) would require a study on fish tissue selenium whole-body or egg-ovary concentrations. The current baseline data will not be comparable to future EEM studies using fish tissue muscle concentrations of selenium and US EPA guideline methodology. There is currently EEM guidance under development for conducting selenium fish tissue sampling in fish populations that will utilize the FEQG which applies to fish tissue egg-ovary and whole-body concentrations of selenium. Additionally, the Proponent has made a commitment to utilize the most stringent guidelines available.</p> <p>Based on the Project’s proposed effluent concentrations of selenium, fish tissue sampling will be required as part of the EEM monitoring for the Project. The ECCC FEQG is the guideline applied to these studies, and the current use of this guideline will facilitate the comparison to future monitoring studies.</p> <p>Furthermore, the Proponent has not provided sufficient explanation in their response for the use of the less stringent US EPA guideline compared to the more conservative FEQG.</p> <p>The Proponent should explain their use of the US EPA guidelines over the ECCC FEQG or update the selenium fish tissue assessment in the draft EIS and the Wheeler River ERA as needed using ECCC’s FEQG.</p> <p>As noted in IR-126, please update the selenium fish tissue assessment in the draft EIS and the Wheeler River ERA (Appendix 10- A (ERA) in Section 10) as needed using ECCC’s FEQG. If the FEQG will not be used, provide further rationalization for the use of the US EPA guidelines when creating the study on fish tissue selenium concentration in the EEM.</p>	<p>The EIS assessed selenium in fish in terms of muscle tissue because the available baseline data were for muscle tissue. Since the review comment highlights the EEM program and the fish tissue selenium study component more specifically we note that the MDMER (2023) allows use of muscle tissue in the EEM study of selenium in fish (see Schedule 5, 12(1)(e)(iv). It is further noted that Denison has committed to a pre-operational EEM study and will conduct that study in accordance with the regulation and available federal guidance. The pre-operational EEM study will include a study respecting selenium in fish tissue.</p> <p>Regarding the EIS, Denison and its SME stand by the current assessment approach, using muscle tissue. Nevertheless, to address the reviewer’s concern, we have calculated whole-body concentrations from the predicted selenium in muscle (Table B.5 of the revised draft EIS Appendix 10-A), using EPA (2021) conversion factors. The resulting whole-body concentrations do not exceed either EPA (2021) or ECCC (2022) guidelines for whole-body tissue, which are 8.5 µg/g dw and 6.7 µg/g dw, respectively, and therefore the conclusions of the risk assessment are unchanged. No change to the EIS is warranted.</p> <table><tr><th>Fish Species</th><th>Lake</th><th>Muscle ug/g fw</th><th>Muscle ug/g dw</th><th>Whole ug/g dw</th></tr><tr><td rowspan="5">N. Furthermore, in their response the Proponent does not use available species-specific moisture content and conversion factors available for northern pike and lake whitefish when converting muscle selenium concentrations to whole-body selenium concentrations. This means that the Proponent’s prediction likely underestimates the selenium tissue concentrations in the fish. Consequently, the hazard quotients reported are lower than expected.</p> <p>Additionally, the method used by the Proponent to predict selenium concentrations in northern pike and lake whitefish does not appear to include dietary uptake and bioaccumulation of selenium, only direct contact with pore water and overlying water is considered (Table 5-5 in Appendix 10A; Section 2.2.2 of Appendix A to Appendix 10-A). Selenium uptake through the aquatic food web has been shown to result in bioaccumulation of selenium in aquatic-dependent wildlife and resulting in reproductive impairments and malformations (ECCC 2022). Dietary sources of selenium would typically be expected to be the main contribution to tissue concentrations of selenium compared to selenium uptake from water. In most situations, the conversion of inorganic selenium to organic selenium through uptake from water into periphyton/algae is the rate limiting step of selenium bioaccumulation into higher level organisms including benthic invertebrates and fish. This step is affected by many environmental parameters (e.g. temperature, substrate, lentic/lotic environment). Considering that the effluent discharge contains 42 ug/L selenium, consideration of dietary selenium is warranted.</p> <p>The Proponent should update the final EIS with the following information:</p> <div><div>1. Update the ERA with the assessment of selenium concentrations in fish tissue to include a comparison of selenium fish tissue concentrations to ECCC FEQG guidelines for either fish whole body tissue (6.7 ug/g dry weight) or fish egg/ovary tissue (14.7 ug/g dry weight) using species-specific moisture content and muscle : whole body and/or egg-ovary : muscle conversion factors (see Tables B-1b, Table B-3, Table B-4, and Table B-5 in US EPA (2021)).</div><div>2. Update the ERA for the assessment of selenium concentrations in fish tissue using a method that considers dietary uptake and bioaccumulation in order to determine predicted fish tissue</div></div>	<ol style="list-style-type: none"><li>1. The Round 2 IR response provided a comparison against the ECCC FEQG by converting the muscle tissue concentrations to whole-body tissue concentrations using generic conversion values. The dry weight to fresh weight conversion factor used was 0.25. Based on Denison’s measured dry weight content in fish (northern pike and white sucker) the dry weight content ranged from 0.24 to 0.26 which is consistent with literature values; therefore, there is minimal difference in the moisture content. The species specific conversion factors for whole body and egg ovary for northern pike and white sucker from US EPA (2021) have been used to calculate the whole body and egg ovary tissue concentrations. (see Table in Attachment IR-126 Round 3 below for results). All predicted tissue concentrations for northern pike and white sucker in all lakes are below the FEQG.</li><li>2. The ERA utilizes a bioaccumulation factor (BAF) model from water to tissue to conservatively reflect all the multi-media contributions to uptake. The BAFs are provided in Appendix A to the ERA in Section 3.6.1. The selenium BAF for northern pike is a non-linear BAF where BAF = 949x<sup>0.827</sup> (x is in units of µg/L). The selenium BAF for white sucker is 4425 L/kg (the rounded value shown in Figure IR-126-1 is 4400 L/kg). Both BAFs are based on publicly available regional data from other uranium mine sites in northern Saskatchewan (see Appendix A to Appendix 10-A, Section 3.6.1). Additional information on the derivation of the BAFs is provided below in Attachment IR-126 Round 3.</li><li>3. The fish tissue selenium concentrations represent the maximum concentration over the Project phases. This is the most conservative result.</li></ol> <p>References:</p> <p>US EPA. 2021. 2021 Revision to: Aquatic Life Ambient Water Quality Criterion for Selenium 2016. EPA 822-R-21-006. U.S. Environmental Protection Agency.</p> <p>ECCC. 2022. Federal Environmental Quality Guidelines. Selenium. Environment and Climate Change Canada.</p>	<p>Following a supplementary submission by Denison on July 2nd, it has been determined that item one and two of this IR have been resolved, but item three remains outstanding.</p> <p>Denison has not provided the information requested to address Item 3 of the Round 3 IR. Including the estimates of error for the predicted selenium concentrations in fish is necessary as the maximum predictions for Northern Pike in Whitefish Lake North and Middle are within 1-2 ug/g dw of the Egg/Ovary FEQG guideline of 14.7 ug/g dw.</p> <p>In order to resolve this IR, Denison are expected to:</p> <ol style="list-style-type: none"><li>1) Provide an estimate of error associated with the Northern Pike BAF.</li><li>2) Include this estimate of error for the results in Table -IR-126-2 and consider this in the effects assessment.</li></ol>	<ol style="list-style-type: none"><li>1. An estimate of the error associated with the Northern Pike BAF is included in Attachment IR-126 Round 4.</li><li>2. An estimate of the whole body and egg-ovary concentrations using the range of uncertainty (low to high) is included in Attachment IR-126 Round 4.</li></ol> <p>Denison will include the information on selenium BAF sensitivity analysis from this IR response in a new section in the final EIS of Appendix 10-A, Section 6.2.3.</p>

## Attachment IR-126 Round 3

The whole-body concentrations were recalculated from the predicted selenium in muscle tissue concentrations (Table B.5 of the revised draft EIS Appendix 10-A), using site-specific moisture content and the species-specific US EPA (2021) conversion factors. The values used for moisture content and conversion factors for muscle to whole body and egg-ovary to whole body are shown in Table IR-126-1 below. The resulting whole-body concentrations (Table IR-126-2) do not exceed either EPA (2021) or ECCC (2022) guidelines for whole-body tissue, which are 8.5 µg/g dw and 6.7 µg/g dw, respectively, and therefore the conclusions of the risk assessment are unchanged. Note that selenium was identified as a COPC in the risk assessment and a full quantitative risk assessment was completed including calculation of hazard quotients. No change to the EIS is warranted based on the results shown in the Table below. The calculations do not change the conclusions of the EIS of no significant adverse effect. Selenium is included as part of the environmental monitoring program throughout all phases of the Project.

Selenium bioaccumulation factors (BAFs) were derived using regional data. Using measured fish tissue data and measured water concentrations to develop the BAF incorporates the selenium bioaccumulation through the food chain and would represent the transfer (enrichment function and trophic transfer) as shown in the figure below.

Image adapted from Chapman *et al.* (2009)

Large- and small-bodied fish were considered separately because selenium concentrations are based on different tissue analyses for these two groups: wet weight muscle and wet weight whole body, respectively. Tissue data were available for northern pike, cisco, lake trout, longnose sucker, lake whitefish, white sucker, lake chub and spottail shiner. The data comparisons resulted in the following conclusions:

- The same BAF can be applied to a fish species at different lakes;
- The BAF values for longnose sucker, cisco and lake trout were not significantly different from those for northern pike, therefore data from these species were combined to derive a BAF for northern pike;
- The BAF values for lake whitefish and white sucker were significantly different ( $p < 0.05$ ) from that for northern pike; and
- The BAF values for lake chub and spottail shiner were not significantly different ( $p > 0.05$ ) from each other, therefore data for these two species were combined to derive a BAF for small-bodied fish.

Most of the data from fish species evaluated demonstrated a linear relationship between fish tissue and water concentrations. The linear regression line was shown to underestimate selenium in northern pike tissue at low water concentrations. Therefore, a non-linear relationship was adopted for northern pike, where the  $BAF = 949x^{0.827}$  ( $x$  is in units of  $\mu\text{g/L}$ ). As shown in the figure, the

linear (dotted line) and power function (solid red curve) are quite similar except where the water concentrations were less than 0.001 mg/L. The  $R^2$  values for the linear and power function are similar but the better fit at the lower water concentration values provided a basis for selecting the power function as the preferred model for the northern pike. Correlation analyses of the tissue and water concentration data for selenium indicated that a significant relationship ( $p < 0.05$ ) existed between the water and tissue concentrations in northern pike, white suckers, lake whitefish and small-bodied fish.

## Attachment IR-126 Round 4

As identified in Attachment IR-126 Round 3, selenium bioaccumulation factors (BAFs) were derived using regional data. Using measured fish tissue data and measured water concentrations to develop the BAF incorporates the selenium bioaccumulation through the food chain. For northern pike, a non-linear relationship was adopted where the  $BAF = 949x^{0.827}$  ( $x$  is the water concentration in units of  $\mu\text{g/L}$ ).

The whole-body concentrations were calculated from the predicted range of selenium in muscle tissue concentrations, using site-specific moisture content and the species-specific US EPA (2021) conversion factors. The resulting whole-body concentrations do not exceed either EPA (2021) or ECCC (2022) guidelines for whole-body tissue, which are  $8.5 \mu\text{g/g dw}$  and  $6.7 \mu\text{g/g dw}$ , respectively, and therefore the conclusions of the risk assessment are unchanged. Note that selenium was identified as a COPC in the risk assessment and a full quantitative risk assessment was completed including calculation of hazard quotients.

To evaluate the range of uncertainty in the northern pike BAF, a power-regression (log-log) of the water and fish tissue selenium data was used to generate the expected relationship between selenium in water and selenium in tissue. The model was a good fit to the data ( $R^2 = 0.88$ ). The regression equation ( $y = ax^b$ ) was:

$$Se_{[\text{tissue}; \mu\text{g/g ww}]} = a \times Se_{[\text{water}; \text{mg/L}]}^b,$$

where the 95% confidence interval for ' $a$ ' was 295–3060 and for ' $b$ ' was 0.66–0.99.

The predicted mean response and confidence ribbon for those values are shown in Figure IR-126-1 and Table IR-126-1. Analysis was completed in *R* v. 4.4.4 using base functions (e.g., *lm()*) and associated *predict()*. Plots were generated using *ggplot* v. 3.5.5.

Note: Blue dots are Wheeler River predictions, black dots are regional data

**Figure IR-126-1: Predicted Mean Response and Confidence Ribbon – Selenium in Fish**

**Table IR-126-1: Predicted Mean Lower and Upper Fish Tissue Selenium Concentrations**

Fish Species	Lake	Water Concentration LA-5 mg/L	Fish Muscle Tissue (Mean Value) µg/g fw	Fish Muscle Tissue (Low Value) µg/g fw	Fish Muscle Tissue (Upper Value) µg/g fw
Northern Pike	Reference	3.35E-05	1.89E-01	1.06E-01	3.36E-01
	Whitefish Lake North	3.28E-05	1.86E-01	1.04E-01	3.31E-01
	Whitefish Lake Middle	4.33E-04	1.57E+00	1.23E+00	2.00E+00
	Whitefish Lake South	4.12E-04	1.51E+00	1.18E+00	1.93E+00
	McGowan Lake	2.59E-04	1.02E+00	7.65E-01	1.37E+00
	Russell Lake	1.95E-04	8.12E-01	5.85E-01	1.12E+00

Using the range of the uncertainty in the northern pike BAF (from Table IR-126-1), fish muscle tissue selenium concentrations were calculated for the various lakes, using site-specific moisture content and the species-specific US EPA (2021) conversion factors (see Table IR-126-2).

For reference, as indicated previously the whole body tissue and egg-ovary concentrations do not exceed the ECCC (2022) guidelines for the mean BAF. The resulting whole-body tissue and egg-

ovary concentrations do not exceed the ECCC (2022) guidelines for the BAF lower range of uncertainty. At the upper range of the BAF, the egg-ovary concentration in Whitefish Lake exceeds the whole body guideline of 6.7 µg/g dw and the egg-ovary guideline of 14.7 µg/g dw from ECCC (2022). At all other lakes the predicted whole body and egg-ovary concentrations are below the selenium guidelines (see Table IR-126-3).

The results of the EIS are interpreted based on the expected mean BAF. Based on the expected selenium BAF, no significant adverse effects are predicted to northern pike from exposure to selenium. The uncertainty results requested by the CNSC provide a range (lower and upper) around the risk; however, there are numerous conservative assumptions in the overall assessment that would indicate the expected BAF is sufficiently conservative. The effluent quality in the EIS provides a bounding assessment and a conservative representation of risk; however, Denison plans to continue to refine effluent quality predictions as part of the BATEA assessment and licensing process. Additionally, selenium is included as part of the environmental monitoring program throughout all phases of the Project. Continued monitoring will provide the ability for adaptive management throughout the life of the mine, which is commensurate with the level of risk associated with the upper bound BAF.

**Table IR-126-2: Calculated Whole Body and Egg-Ovary Selenium Concentrations – Expected Mean BAF**

Fish Species	Lake	FEQG (µg/g dw)		6.7	14.7
		Muscle µg/g fw	Muscle µg/g dw <sup>(a)</sup>	Whole Body µg/g dw <sup>(b)</sup>	Egg-Ovary µg/g dw <sup>(c)</sup>
Northern Pike	Ref	1.89E-01	8.58E-01	0.68	1.61
	Whitefish Lake North	1.86E-01	8.45E-01	0.67	1.59
	Whitefish Lake Middle	1.57E+00	7.13E+00	5.61	13.40

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, July 8, 2024)	IR (ROUND 4, Sept. 16, 2024)	Denison Response (ROUND 4, Sept. 27 2024)
IR-142		<p><b>Context:</b> The Proponent did not conduct any field work to identify potential wolverine dens in the Project area and therefore did not present any mitigations for the potential impacts to wolverine dens.</p> <p>In Section 9.3.3.2.1, the Proponent states: “Denning females are sensitive to disturbance during denning season in February to April and may abandon their dens and, in some cases, their litter, which may decrease their reproductive success.”</p> <p>In Section 9.3.6, the Proponent states: “In the Project Area, 145.0 ha or 100% of available wolverine habitat is assumed to be removed and will not be available to wolverine for the duration of the Project (Table 9.3-13). Similarly, 145.0 ha (3.4%) of available wolverine habitat within the Wildlife LSA is anticipated to be removed, all from the Project Area, during site clearing in Construction. In the Terrestrial RSA, up to 0.5% (145.0 ha; from the Project Area) of available wolverine habitat is anticipated to be removed during site clearing in Construction.”</p> <p>The residual effect assessment estimates that 8.2% of available wolverine habitat within the Terrestrial RSA may be altered or lost (Table 9.3-20).</p> <p><b>Rationale:</b> As Wolverine is a Species at Risk Act Schedule 1 listed species, effects need to be identified, avoided, lessened and monitored. Mitigations, such as setback distances, should be used to protect important habitat features, such as dens.</p> <p>Wolverine occupy large home ranges and, therefore, need vast tracts of undisturbed land to maintain viable populations. The species avoids most human footprint types and linear features</p>	<p>1. Please provide additional information on whether the lost and/or altered wolverine habitat overlaps with wolverine home ranges.</p> <p>2. Describe any important wolverine habitat feature (i.e., dens) that may be lost as a result of the Project.</p> <p>3. Assess the need for pre-construction/pre-clearing surveys to identify any wolverine denning sites.</p> <p>4. Please provide additional information on whether the remaining, available, undisturbed wolverine habitat size is suitable to maintain populations.</p>	<p>1. While wolverine were not observed during baseline studies for the Project, it is assumed that the Project (Project Area, LSA) may overlap with wolverine home ranges. As described in the EIS, wolverine occur in low densities across all forest stand and vegetation types but are generally absent from areas of human development and activities.</p> <p>2. No wolverine dens were identified during any of the baseline studies. It is not anticipated that wolverine denning sites will be lost and/or altered because there are no specific landscape features typically used by wolverine as potential denning sites located in the Project footprint. Further, much of the proposed Project footprint will be developed within previously disturbed areas, including roads and cutlines.</p> <p>3. Pre-construction surveys will be completed to identify all sensitive wildlife habitat features, including wolverine denning sites.</p> <p>4. Most of the Project footprint is already disturbed through previous exploration activities. The total expected direct habitat loss of 169.6 ha includes the already disturbed areas. In the Terrestrial RSA, 8.2% of available wolverine habitat may be altered or lost; this includes 0.5% that will be cleared within the Project Area during Construction, and an additional 7.7% that may be altered through indirect effects (sensory disturbance). The magnitude of this effect was characterized as being "moderate" and the residual effect is not expected to result in a change that will alter wolverine habitat integrity to the point where it would not be able to sustain the regional populations of wolverine. This considers that no wolverine were observed during the baseline investigations, the small Project footprint, and the typically large size of a wolverine home range.</p>	<p>The information provided by the Proponent is complete, however, a follow up IR regarding survey methods for all pre-construction and pre-clearing surveys is required. See follow-up IR-142-159-167.</p>	n/a	n/a	n/a	n/a	n/a
IR-159		<p>Context and Rationale: Information presented in the draft EIS is insufficient to accurately predict Project impacts to breeding birds. The Proponent collected a single year of breeding songbird point counts and aerial waterfowl surveys (including avian species at risk). A single year of surveys in which birds may be unusually scarce or abundant could severely compromise interpretation of post-construction monitoring data.</p> <p>Additionally, data presented in the draft EIS is from 2017 and ECCC advises that more recent data is needed for a comprehensive baseline to verify Project impacts.</p> <p>Data from the Saskatchewan Conservation Data Centre (HABISask), the Saskatchewan Breeding Bird Atlas and the Boreal Avian Modelling project contain information on avian densities and avian species at risk that could supplement field data.</p> <p>The national standard for major projects recommends a minimum of two years of field surveys to be provided, so that temporal variability can be considered when comparing post-construction against baseline records and other available data.</p>	<p>Supplement breeding bird point count data and aerial waterfowl data collected during 2017 with additional pre-construction field data or existing post-2017 data/modelling to provide a comprehensive baseline that can be used to verify Project impacts during construction and operational phases.</p>	<p>The baseline data presented in the draft EIS are sufficient for the intended purpose – that is the data are sufficient, in conjunction with regionally available data, to identify potential project effects. The data collected as part of the baseline studies for birds was focused on the habitat types and areas most likely to be disturbed as a result of the Project. Conducting additional baseline surveys for waterfowl, raptors, and breeding birds is not anticipated to result in changes to the assessment outcomes and predictions made as part of the effects assessment, which was habitat-based, for avian species. The assessment methods used a conservative approach with the assumption that following the implementation of site-specific mitigation measures, the proposed Project activities would have a residual effect on these species guilds regardless of species presence on site.</p> <p>As described in the EIS, pre-construction surveys will be conducted prior to the commencement of any vegetation clearing or soil disturbance. Avian species will also be routinely monitored throughout the life of the Project. Results from the surveys and monitoring activities are expected to inform the adaptive management process to update Project design and identify the need for additional mitigation measures, if required. Note: Section 9.4.3.3 of the draft EIS includes all available information from the HABISask database at the time of the assessment. While recent surveys from Environment and Climate Change Canada and the Saskatchewan Breeding Bird Atlas have expanded surveys into the northern boreal forest, these data are not yet publicly available or published to make inferences on population trends for</p>	<p>This response has not been accepted.</p> <p>The Proponent’s response indicated that their opinion is that the data presented in the draft EIS is sufficient and that no updates to the draft EIS are needed.</p> <p>However, a single year of baseline data from 2017 is insufficient to assess Project impacts during the follow-up and monitoring program. Although pre-construction surveys prior to clearing can give a very localized picture of the avian community, it does not provide a baseline within the Regional Study Area (RSA) of the bird community and will be of limited use for comparing construction and operational monitoring data to baseline conditions. Use of more recent data or supplemental data</p>	<p>Denison and its SME continue to be of the opinion that the data on which the effects assessment is based are sufficient and fit for purpose as it concerns the EA process. The effects assessment was not based on the 2017 field survey data alone. The EA used an accepted, proven habitat-based EA approach to address the variability of population surveys. Further, the EA used all available, recent/relevant survey data collected in appropriately timed and executed methodologies, including IK. The supplemental avian data received from records from the Saskatchewan Breeding Bird Atlas downloaded through the NatureCounts web portal (Saskatchewan Breeding Bird Atlas 2017), which also includes data received as part of the Saskatchewan Boreal Monitoring Strategy program. These data represent bird observations from 24-point counts conducted on June 7 and June 9, 2019. Nine point-counts are located approximately 6.5 km east of the Project footprint, the majority of which are located in the BS3 ecosite type; 15 point-counts are located approximately 7.7 km south of the Project footprint, the majority of which are located in the BS3/BS7 ecosite type. During this survey effort, 24 migratory songbird species were documented. A summary of the total number of individuals observed for each species across all plots is provided in Appendix 9-F of the revised Draft EIS. While the supplemental data do provide further context for the RSA, they would not be expected to alter the findings or the mitigation measures proposed, nor the conclusions reached in the EA.</p> <p>The above does not preclude the implementation of further breeding bird surveys prior to site development and operations. Denison accepts the comment that additional, more recent information, as well as supplemental data as available, and will provide</p>	n/a (accepted)	n/a	n/a	n/a

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, July 8, 2024)	IR (ROUND 4, Sept. 16, 2024)	Denison Response (ROUND 4, Sept. 27 2024)
				migratory songbirds that could use the available habitat in the Terrestrial RSA.	can account for interannual variation and any regional effects and will allow for a more accurate review of mitigation and follow-up measures.  See follow-up IR-142-159-167-R1	the basis for a more effective review of mitigation and follow-up measures as the Project moves forward. The details of such follow-up monitoring will be defined as part of the further consideration of planning related to follow up programs.  For clarification the pre-clearance wildlife sweeps are intended to identify sensitive wildlife features (e.g., hibernacula, roosting habitat, dens, nests, mineral licks) that would require site-specific mitigation measures to limit or avoid adverse effects. The spatial scale of where these pre-construction sweeps would be completed could be expanded to include other areas beyond the Project Area but within the RSA.				
IR-167	-	<p><b>Context and Rationale:</b> The Proponent has stated that when it is not practicable to clear outside of the breeding bird window, they will conduct pre-clearing surveys. Section 9.4.5.2.1 states: “Prior to commencing any site clearing (i.e., vegetation clearing and/or soil disturbance) during the nesting season, pre-clearing nest surveys will be conducted at that location within the Project Area.”</p> <p>ECCC does not recommend the use of nest searches or pre-clearing surveys for active bird nests during the breeding season as a mitigation, given the difficulty associated with finding nests reliably and the high likelihood of disturbing nesting birds when searching. Instead, ECCC recommends that clearing and grubbing activities not be conducted during the breeding bird season.</p> <p>The Migratory Birds Regulations 2022 (MBR 2022) brings new scenarios that need to be considered:</p> <ol style="list-style-type: none"> <li>Most migratory birds: <ul style="list-style-type: none"> <li>Nests are protected only when they are in use or when live eggs or chicks are present.</li> </ul> </li> <li>Migratory birds listed in MBR 2022 Schedule 1: <ul style="list-style-type: none"> <li>For the 18 species of migratory birds identified on Schedule 1, the MBR 2022 provide year-round nest protection until they can be deemed abandoned.</li> </ul> </li> <li>Migratory birds listed under SARA: <ul style="list-style-type: none"> <li>For some SARA listed migratory birds, the residence prohibition (s.33) will protect nests that are not active, but are re-used in subsequent years, and the critical habitat prohibition (s.58) will protect nests that are part of the critical habitat identification. Those prohibitions apply everywhere in Canada and at all times of the year. In these cases, a SARA permit will be required.</li> </ul> </li> </ol>	<p>Provide the following information:</p> <ul style="list-style-type: none"> <li>details on how vegetation clearing related to site development will be conducted to minimize risk to migratory birds and species at risk (SAR).</li> <li>the timing window that will be used for vegetation removal to reduce risk to migratory birds and SAR</li> </ul>	<p>Site clearing and other works that involve disturbance of vegetation and/or soil will be completed during least-risk timing windows for migratory birds and SAR (i.e., winter), where practical, to avoid disturbance during sensitive time periods. It is noted that additional information related to timing windows and species as it concerns Project activities has been provided in response to IR-134.</p> <p>Pre-clearing surveys will be conducted and set-back buffers implemented, as needed. The pre-clearance surveys will be completed prior to all clearing events, regardless of the time of year / season when clearing is set to occur. If nests or tree cavities should be encountered during pre-construction surveys or ongoing monitoring activities, any subsequent Project activities will be in accordance with the 2022 Migratory Birds Regulations.</p>	<p>Response is accepted, but also see AD-57 in the Advice to Proponent table and follow-up IR-142-159-167-R1.</p>	n/a	<p>Response is accepted, but also see AD-57 in the Advice to Proponent table and follow-up IR-142-159-167-R1.</p>	See response to IR-142-159-167-R1 below.	n/a	n/a
n/a	IR-142, IR-159, IR-167 - R1		n/a	n/a	<p>Provide survey methodology and timing for all preconstruction and pre-clearing surveys, including avian and species at risk surveys (caribou, wolverine).</p>	<p>As noted in the August 2023 IR responses, site clearing and other works that involve disturbance of vegetation and/or soil will be completed during least-risk timing windows for migratory birds and SAR (i.e., winter), where practical, to avoid disturbance during sensitive time periods.</p> <p>However, in the event that site clearing activities or other works are anticipated to occur during a sensitive timing window for migratory birds and SAR, the pre-disturbance wildlife sweeps would be conducted by qualified biologists at least 7 days prior to any scheduled vegetation/land disturbance. The biologist would search the proposed area to be cleared, plus a 100 m buffer, for sensitive wildlife features that may be used by avian SAR (e.g., nests and/or nesting cavities), woodland caribou, and bats (e.g., roosting sites/cavities). The wildlife sweeps will not be species-specific surveys focused on species at risk per se, but will be based on timing of Project related activities (i.e., will be completed in advance of site clearing activities). These surveys are intended to identify sensitive wildlife features such as hibernacula, dens, nests, cavities, mineral licks, that would require specific mitigation measures to avoid or minimize adverse effects on identified features and are not species-specific. Nevertheless, the methods associated with these pre-construction and pre-clearing sweeps will be</p>	<p>The Proponent notes that:</p> <ul style="list-style-type: none"> <li>Site clearing and other works that involve disturbance of vegetation and/or soil will be completed in winter.</li> <li>Pre-disturbance wildlife sweeps would be conducted by qualified biologists at least seven days prior to any scheduled vegetation/land disturbance.</li> <li>Mitigation measures to avoid or minimize adverse effects on identified features are not species specific.</li> <li>The methods associated with these pre-construction and pre-clearing sweeps will be</li> </ul>	<p>The requested information on species at risk pre-clearance sweeps are summarized below in Attachment IR-142, IR-159, IR-167-R1 (Round 3).</p> <p>Denison and its SMEs believe we have provided sufficient information and analysis in the EIS, associated supporting documents and IR responses for the federal government to make a determination as to the effect of the Project on SAR, within the approved scope of the Project and CEAA 2012.</p> <p>Commensurate with the stage of the Project and EA process conceptual level detail for monitoring and follow-up programs (see EIS Appendix 16F) and a description of the programs fit into the overall environmental management system (EIS Section 2.9) have been provided. Further details regarding these programs</p>	<p>The Proponent notes that they will use visual searches for several bird SAR. This includes Bank Swallow, Barn Swallow, Common Nighthawk, and Horned Grebe. While visual observations are an appropriate method for detecting Barn and Bank Swallow nests, it is not suitable for detecting Common Nighthawk. The province of Saskatchewan provides appropriate protocols for detection of Common Nighthawk.</p> <p>The Proponent also notes that they will conduct call-playback or visual searches for Olive-sided Flycatcher and Short-eared Owl. While the call-playback surveys would be more likely to detect individuals in areas to be cleared, the visual searches are unlikely to be effective for these species. The Proponent should consider following the provincial detection survey protocols for Short-eared Owl and Olive-Sided Flycatcher.</p>	<p>1. To address this part of the Round 4 IR, the wildlife species at risk pre-clearance sweep methods and timing table (now included in the final EIS Appendix 9-D as Table 4-1) has been updated.</p> <p>In this table, the column “survey techniques” has been updated as follows:</p> <ul style="list-style-type: none"> <li>common nighthawk – “visual search” changed to “call-playback”</li> <li>short-eared owl – “call-playback or visual searches” changed to “call-playback.”</li> <li>olive-sided flycatcher – “call-playback or visual searches” changed to “call-playback.”</li> </ul> <p>A reference to the Saskatchewan SDSPs have been added to the last column of Table 4-1.</p> <p>Finally, a footnote has been added to the table: “Surveys will be completed by qualified professional biologists; in their capacity as professional biologists, they will refer to available guidance such as the Saskatchewan species detection survey protocols to develop details of the surveys (e.g.,</p>

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, July 8, 2024)	IR (ROUND 4, Sept. 16, 2024)	Denison Response (ROUND 4, Sept. 27 2024)
						<p>tailored to species at risk that may potentially be using habitats at certain times of the year. For example, methods will include searching prominent topographic features such as rock outcropping or downed forest trees and debris where wolverine may establish denning sites. In the event the sweeps are conducted during the winter period, methods related to snow tracking would identify wolverine presence based on tracks and potential denning sites in the snow pack within ravines or drainages within the forested areas within the study areas (as per Resources Inventory Committee 1999). Additionally, methods will include searching for potential roost trees for bat species, as per protocols included in the Wildlife Habitat Features Field Guide (BC Ministry of Environment and Climate Change Strategy, Ecosystems Branch 2019). Depending on the results of these sweeps, appropriate mitigation measures will be developed and implemented.</p> <p>If sensitive wildlife features are found, they will be documented (e.g., photographs, GPS location recorded). The data collected would inform the development and implementation of appropriate mitigation measures (e.g., appropriate set-back distances for Project activities and/or consideration of timing windows as per SK MOE (2017), in consideration of applicable laws and regulations (e.g., Migratory Birds Conservation Act, Wildlife Act), as appropriate.</p> <p><b>References:</b></p> <p>B.C. Pp. 119</p> <p>Resources Inventory Committee. 1999. Inventory Methods for Medium-Sized Territorial Carnivores: Coyote, Red Fox, Lynx, Bobcat, Wolverine, Fisher and Badger. Standards for Components of BC’s Biodiversity No. 25. Ministry of Environment, Lands and Parks.</p> <p>Saskatchewan Ministry of Environment (SK MOE). 2017. Saskatchewan Activity Restriction Guidelines for Sensitive Species. <a href="https://publications.saskatchewan.ca/api/v1/products/79242/formats/89555/download">https://publications.saskatchewan.ca/api/v1/products/79242/formats/89555/download</a> (accessed July 2021).</p>	<p>tailored to species at risk that may potentially be using habitats at certain times of the year. For example, methods will include searching prominent topographic features such as rock outcropping or downed forest trees and debris where wolverine may establish denning sites. In the event the sweeps are conducted during the winter period, methods related to snow tracking would identify wolverine presence based on tracks and potential denning sites in the snow pack within ravines or drainages within the forested areas within the study areas (as per Resources Inventory Committee 1999). Additionally, methods will include searching for potential roost trees for bat species, as per protocols included in the Wildlife Habitat Features Field Guide (BC Ministry of Environment and Climate Change Strategy, Ecosystems Branch 2019). If sensitive features are found, then they will be documented, and data collected would inform the development and implementation of appropriate mitigation measures.</p> <p>It is unclear what is meant by “surveys are not species-specific” but sweeps will be “tailored to the species at risk”. It is also unclear how mitigation measures will be developed and implemented in a seven-day period.</p> <p>In order for ECCC and CNSC to provide advice on potential effects to SAR based on the habitat potential mapping, the development of species-specific mitigation measures needs to be produced for review during this assessment process. The Proponent also needs to provide details on follow up and monitoring programs that are in place to confirm that the mitigation measures implemented are effective.</p> <p>In addition, ongoing monitoring is required for SAR. Denison is expected to describe the planned monitoring and follow-up programs for SAR. Denison must justify how the proposed methods are adequate to provide a baseline for each SAR, to verify that mitigation measures are effective, and to allow for statistically robust comparison to assess potential impacts on SAR over the lifecycle of the project.</p>	<p>have been provided in response to various IRs. Denison continues to refine the program level detail, and in parallel develop its plan level documentation to support CNSC licensing and provincial permitting. Any ongoing monitoring for SAR will be detailed in the Wheeler River Project’s Environmental Management Program documentation, including for example the Biodiversity Management Plan. We also note that ongoing SAR management is under Provincial jurisdiction. For reference, within the EIS, the EMS framework is described in Section 2.9, wildlife monitoring plans are provided in Section 9.3.8, avian monitoring plans are provided in 9.4.8, and a summary of general and species-specific mitigation measures is provided in Appendix 9-D. Briefly, wildlife and avian species will be routinely monitored throughout the life of the Project in accordance with the wildlife monitoring plans. An adaptive management process will be employed, after applicable consultations and approvals, where implemented mitigation measures are found to be unsuccessful.</p>	<p>In order to resolve this IR, Denison are expected to:</p> <ol style="list-style-type: none"> <li>1. Modify the Table in “Attachment IR-142, IR-159, IR-167-R1 (Round 3)” to incorporate appropriate protocols for detection of Common Nighthawk, Short-eared Owl, and Olive-Sided Flycatcher, as suggested by ECCC.</li> <li>2. Incorporate the Table into the EIS documentation, e.g., Appendix 9-D.</li> <li>3. Update any related commitments for pre-clearance / pre-disturbance surveys in their commitments register.</li> </ol>	<p>selecting the appropriate time of day for the survey).”</p> <p>2. The table is now available in the final EIS (Appendix 9-D Table 4-1).</p> <p>3. Existing commitment 9-3 has been updated and now reads (additions in <b>bold</b>): “To adequately address potential effects, regardless of the wildlife, seasonal or species-specific sensitivities, pre-disturbance wildlife clearance surveys (i.e., not species-specific surveys) will be completed prior to any work commencing. Results of the wildlife clearance surveys will be used to inform the design and delineation/establishment of suitable setback distances (i.e., specific to species, habitat, life-cycle sensitivities), work delays and/or other species-specific mitigation measures at that location, with discussions with ENV as appropriate. <b>The details on the methodology of species-specific pre-clearance sweep protocols and timing are provided in the Appendix 9-D of the final EIS.</b>”</p>

Attachment IR-142, IR-159, IR-167-R1 (Round 3)

Table 1: Species at Risk Survey Methods

Species of Concern	Baseline Survey Results	Assessed in the EIS	Important Habitat and Needs	Survey Target Areas	Survey Technique	Timing	Action if Species Detected	Information Source
Northern Leopard Frog	Not observed.	Appendix 9-D	From winter sites, adult frogs travel up to 1.6 km to breed.	Wetlands/ water/ riparian / wet/ moist/ scrublands/ bogs/ fens.	Visual searches for egg masses or frogs.	Snow/ice-free early spring and spring season.	Pond setback; 10m (low); 200m (Mod) and 500m (High);	MOE (2017)
			They breed in the shallow, warm waters of a variety of wetlands including marshes, springs, flooded ditches, dugouts, borrow pits, beaver ponds, margins of lakes, and slow-moving waters of streams and rivers.		Auditory call surveys.	April 20 to June 10.		
			After breeding, adults and sub-adults may disperse up to 8 km from breeding ponds.		Visual searches for egg masses or frogs.	Snow/ice-free early spring and spring season.		
			Northern Leopard Frogs usually do not utilize areas that are heavily wooded		Visual searches for egg masses or frogs.	Snow/ice-free early spring and spring season.		
			They forage in the summer in riparian or upland habitats. These areas are moist habitats including meadows, pastures, scrublands, riparian corridors, and drainage or irrigation ditches.		Visual searches for egg masses or frogs.	Snow/ice-free early spring and spring season.		
Little Brown Myotis and Northern Bat	34 ultrasonic detections of little brown/northern myotis.	Appendix 9-D	The presence of large snags, tree cavities, is an important attribute in old growth forest stands that provides maternity roosts and day roosts for northern myotis and little brown bats. Building are also used.	Treed areas with the largest diameter and/or older trees. Focus on older forest, or areas with large snags in younger forest within the project footprint (majority is regenerating forest 1-5m).	Daytime visual search of trees and potential roost sites. Systematic meandering search of areas to be cleared during active bat season. Focus on searching for roost features (snags, cracks, stumps, cavities, bark peeling) and bat sign (e.g., guano).	May to Sept	Should a roosting bat be discovered the area will be afforded protection from clearing for 24 hours and re-surveyed. The area will only be cleared if no bats are discovered. A 100 m buffer will be given to nursery roots and 50 m to daily roosting bats. If many roosting bats are recorded compensation will be considered (e.g., bat houses).	COSEWIC (2013a); Resources Information Standards Committee (RISC) (2022)

Species of Concern	Baseline Survey Results	Assessed in the EIS	Important Habitat and Needs	Survey Target Areas	Survey Technique	Timing	Action if Species Detected	Information Source
			Foraging habitat in proximity to roosting sites is also an important factor in roost selection.	Treed areas in proximity to clearings, wetlands and open water.		Year Round	Roost/Foraging site; 100m(low); 500m (Mod) and 500m (High);	MOE (2017)
Wolverine	Not observed.	Section 9.3	A wide variety of forested and vegetation associations are used by wolverine. Habitats must have an adequate year-round supply of food, mainly consisting of smaller prey such as rodents and Snowshoe Hares, and the carcasses of large ungulates, like Moose, Caribou, and Muskox.	All areas of project activity.	Winter den searches.	Snow cover months.	Setback of 250m when occupied and 100m when unoccupied.	COSEWIC (2014); Environmental Protection and Management Guideline (2024)
			Females den under snow-covered rocks, logs or within snow tunnels. Wolverines reproduce in areas where snow cover persists at least into April.					
Woodland Caribou	Observed.	Section 9.3	Woodland caribou may occupy all potential project areas but prefer forests greater than 40 year of age.	All areas of project activity.	Visual search to ensure no caribou are in the area. Ongoing vigilance.	Year Round	If caribou are in the area cease operations until they are clear of the area.	SME (2021)
Rusty Blackbird	Not observed.	Section 9.4	Rusty blackbird primarily nests in small conifers, predominantly spruce. In Canada, nests have also been found in Balsam Fir, Eastern White Cedar, Paper Birch, Balsam Poplar, Red Maple, Pin Cherry, emergent sedges, cattails, and on the ground on a beaver dam	All habitat with spruce, white birch and balsam poplar. Very limited suitable (spruce) habitat within project footprint.	Visual search for nests.	MBCA window	A 75 m buffer around coniferous bogs, fens and other wetlands suitable for Rusty blackbirds (Odsen and Pyper 2019).	Environment Canada. (2015); Odsen and Pyper (2019); Wildlife Division (2020)
			We only have spruce, birch and poplar at Wheeler.			May 1 to July 31	Nest setback of 0-50m (low activity); 150m (Mod activity) and 300m (High activity);	Manitoba Conservation (2021)
Yellow Rail	Not observed.	Section 9.4	Yellow rails inhabit shallow wetlands and other wet areas with grass-like vegetation.	Using available mapping conduct daytime Ecosite verification and stratify surveys in appropriate habitat only. Based on available mapping, no suitable habitat within project footprint.	Mid May to mid to late June. Triplicate nocturnal (23:00-03:00) call-playback surveys spaced at least 4 days apart. Or use Autonomous Recording Units throughout the breeding season.			Environment Canada (2012); SME (2014)
			They breed in wetlands such as damp hay fields or meadows, floodplains, bogs, upper levels of estuaries, salt marshes					
			These wetlands are generally dominated by short, fine-stemmed herbaceous vegetation, especially sedges (Carex spp.), as well as other graminoid vegetation of the families Cyperaceae, Poaceae, and Juncaceae. Vegetation structure (e.g. short, grass-like, and dense) is likely more important than its taxon					

Species of Concern	Baseline Survey Results	Assessed in the EIS	Important Habitat and Needs	Survey Target Areas	Survey Technique	Timing	Action if Species Detected	Information Source
			Breeding habitats may have up to 50 cm of standing water, but typically nesting sites are less than 15 cm deep			May 1 to July 15	Nest site setback; 100m(low); 150m (Mod) and 350m (High);	MOE (2017)
Bank Swallow	Not observed.	Appendix 9-D	The Bank Swallow readily breeds in a wide variety of low-elevation (< 900 m), natural and anthropogenic habitats, including: lake and ocean bluffs; stream and river banks; sand and gravel pits; roadcuts; and piles of sand, topsoil, sawdust, coal ash, and other materials.	Survey key habitat features identified as important.	Visual survey during timing window.	May 15 to July 31	Nesting Colony Setback; 50m (low); 150m (Mod) and 300m (High);	Manitoba Conservation (2021)
			Nest burrows are nearly always in a vertical or near-vertical bank (range: 76-105° slope;					COSEWIC (2013b)
			In some cases, Bank Swallows have nested in drain pipes and in structures designed and built specifically for nesting Bank Swallows					
Barn Swallow	Four visual/auditory detections.	Appendix 9-D	Nest on horizontal and vertical structures that include natural sites, such as cliffs and caves, as well as human-made structures, such as barns, bridges, and culverts . The nesting substrate must be rough, or have a ledge or projecting objects, such as bolts or light fixtures, to provide additional structural support to the nest.	Open areas in proximity to water. All buildings and man made structures.	Visual.	May 15 to Sept 30	Nest site setback; 50m (low); 100m (Mod) and 100m (High);	Manitoba Conservation (2021)
			Nesting sites must provide access to open areas with an abundant supply of aerial insects to feed on; features such as wetlands, waterbodies, watercourses, meadows, grazed grassland, and farmland are preferred . Proximity to a waterbody or moist area with a supply of wet mud is needed to facilitate nest construction.					COSEWIC (2021a)
Common Nighthawk	Two nests, five visuals and 76 auditory/visual detections.	Section 9.4	Nests are typically in open sites with dry, well-drained substrates that will not overheat and that have shade nearby for young to shelter from the sun and predators. Nest sites include forest clearings, bare patches in grassland, gravel pits, outcrops, road or rail sides, and, rarely, fenceposts.	All upland habitat.	Visual searches.	May 1 to Aug 31	Nest site setback; 0-50m (low); 150m (Mod) and 300m (High);	MOE (2017)
Horned Grebe	One observation.	Appendix 9-D	More than 90% of the Horned Grebes in North America breed in ponds and lakes in western and northern Canada.	Water bodies within the project area.	Visual searches.	May 1 to Sept 15	Nest site setback; 100m (low); 200m (Mod) and 400m (High);	Manitoba Conservation (2021)
								COSEWIC (2009)

Species of Concern	Baseline Survey Results	Assessed in the EIS	Important Habitat and Needs	Survey Target Areas	Survey Technique	Timing	Action if Species Detected	Information Source
Olive-sided Flycatcher	Fourteen observations.	Section 9.4	Olive-sided Flycatcher has been widely observed in open coniferous or mixed coniferous forests, often located near water or wetlands with the presence of tall snags or trees	All conifer and/treed upland areas.	Call-playback or visual searches.	May 1 to Aug 31	Nest setback; 100m (low); 300m (Mod) and 500m (High);	MOE (2017)
			Data gathered from points across Canada indicate that mature conifer stands within patchy landscapes influenced by natural disturbance (e.g., recent burns) support the highest densities					Environment Canada (2016)
			Olive-sided Flycatcher prefers post-burn areas or wetlands that create open habitats for the species to forage					
Short-eared Owl	Not observed.	Section 9.4	Nesting generally occurs in large open areas	Open upland and lowland areas with no trees and some shrub cover.	Call-playback or visual searches.	March 25 to Aug 1	100m (low); 300m (Mod) and 500m (High);	MOE (2017)
			Requires a minimum area of about 50-100 ha, consistent with the mean territory size of 82 ha reported in Manitoba.					COSEWIC (2021b)
			In the north, nests are primarily in tundra (Sinclair et al. 2003), and sometimes beside a small shrub that provides cover

IR-170

- Department: ECCC
- Project Effects Link: Migratory birds
- Reference to EIS, appendices, or supporting documentation: Section 9.4.6.4, Residual Effects Evaluation for Bird SAR, Table 9.4-19

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, July 8, 2024)	IR (ROUND 4, Sept. 16, 2024)	Denison Response (ROUND 4, Sept. 27 2024)
IR-170	-	<p><b>Context and Rationale:</b> The table and map presented by the Proponent do not appear representative of all available habitat for common nighthawk (CONI). Although CONI do preferentially use open areas such as gravel (often an anthropogenic disturbance) and regenerating forest, as identified in the draft EIS, they also use rock outcrops that can be within forested areas. As this area lies within the pre- Cambrian shield, there are likely rock outcrops that are also available habitat.</p> <p>As aerial insectivores, CONI select nesting areas in close proximity to wetlands or lakes where there is abundant forage.</p> <p>Habitat requirements and preferences for all species at risk is required for developing effective mitigations and adaptive management.</p>	<p>1. Provide an updated table and map that considers all available habitat for common nighthawk.</p> <p>2. Additionally, as part of environmental management plans the Proponent should include species-specific mitigations that are biologically relevant to all the species at risk for all Project phases and components.</p>	<p>1. The methodology for the habitat-based assessment appropriately evaluated potential adverse effects on avian species. The VCs and KIs were selected following extensive consultation with Indigenous nations and communities and other Interested Parties; the VCs and KIs appropriately focused the EA; no updated table or map is considered to be required. In addition, further mapping is not expected to affect or change the findings and conclusions of the draft EIS.</p> <p>2. Common Nighthawk were observed in the Project study areas during the baseline studies and are considered to be present and breeding. Rocky outcrops were not reported during the baseline studies (see Section 9.2.3). Pre-clearing surveys will be conducted, set-back buffers implemented, and pre-clearing survey and monitoring results will be used for adaptive management purposes (see also response to IR-159). Species-specific mitigation appropriate for Common Nighthawk is largely related to loss and/or alteration of habitat (including both direct and indirect effects).</p>	<p>This response has not been accepted.</p> <p>Part 1 of the IR was addressed, however, part 2 has not been addressed. ECCC requires this information to properly assess potential the mitigations and adaptive management for Common Nighthawk.</p>	<p>Based on the baseline field survey observations (n=38) for common nighthawk, the majority of observations (n=20) were in association with anthropogenic (disturbed) ecosite types, while the remainder (n=10) were associated with the jack pine-blueberry/black spruce-blueberry/lich (BS3/BS7) ecosite.</p> <p>Updates to Figure 9.4-7, Figure 9.4-12 and Table 9.4-19 of the revised draft EIS have been completed to include all habitat (ecosite) types. See separate response to IR-170: Available Habitat for Common Nighthawk. Figure 9.4-12 in the revised draft EIS has been replaced in the EIS with a revised figure that includes all ecosite types.</p> <p>Mitigation measures that would pertain to common nighthawks are included in Section 9.4.5.2.1 Work Timing Windows and Habitat Disturbance, which state that site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the nesting season, whenever practicable. The nesting season for the Raptors, Migratory Breeding Birds, and Bird Species at Risk VCs in Saskatchewan spans a period from March 15 to August 31. Further, in the event site clearing is necessary within this time frame, pre-clearance wildlife sweeps will be completed where common nighthawks are suspected of nesting; if an occupied nest is found, applicable activity restriction guidelines would be implemented (as per SK MOE 2017).</p> <p><b>References:</b></p> <p>Saskatchewan Ministry of Environment (SK MOE). 2017. Saskatchewan Activity Restriction Guidelines for Sensitive Species. <a href="https://publications.saskatchewan.ca/api/v1/products/79242/formats/89555/download">https://publications.saskatchewan.ca/api/v1/products/79242/formats/89555/download</a> (accessed July 2021).</p>	<p>Item one was accepted, but item two remains outstanding. In Section 9.4.5.2.1, the Proponent has not included species specific mitigations for all species at risk, including common nighthawk. The Proponent should include species specific mitigations for all species at risk, including common nighthawk, so that ECCC can provide advice on the extent of Project impacts to these species.</p> <p>Additionally, the Proponent indicates that prior to site clearing during the nesting season (period from March 15 to August 31), pre-clearing nest surveys will be conducted. ECCC does not typically recommend nest surveys as a pre-clearing activity (please refer to the Advice to the Proponent relating to IR-170). In some instances, surveying for breeding activity using non-invasive methods could be required to determine species presence, and for some migratory birds SAR it may be required to survey for nest trees (residences) prior to clearing as these have year-round protection through SARA and a permit may be required.</p> <p>Specifically, it is not adequate to group SAR together (e.g., all birds) due to the unique life history and habitat requirements of each individual SAR. Denison is expected to provide species-specific mitigation measures for each SAR separately.</p>	<p>See response to IR-142-159-167-R1.</p>	<p>Following the supplementary information provided by Denison on July 8th, CNSC staff determined that Denison has not provided the requested information on species-specific mitigation measures for each SAR. It is not adequate to group SAR together (e.g., all birds) due to the unique life history and habitat requirements of each individual SAR. Denison is expected to provide species-specific mitigation measures for each SAR separately.</p> <p>In order to resolve this IR, Denison are expected to:</p> <p>•Provide species-specific mitigation measures for each individual SAR. Denison may provide this information through revision of Section 3.3 and Table 4.1 in EIS Appendix 9-D.</p>	<p>The requested updates have been made in Appendix 9-D of the final EIS (October 2024).</p>

# 1 Introduction

## 1.1 Background

On October 21, 2022, Denison Mines Corp. (Denison) submitted a draft Environmental Impact Statement (EIS) for the proposed Wheeler River Project (the Project). Based on their initial review, the Canadian Nuclear Safety Commission indicated that the submission contained the required information to proceed with the Federal-Indigenous Review Team (FIRT) technical review of the draft EIS. On March 20, 2023, the FIRT provided Denison with a list of information requests (IRs) for Denison to respond to and eventually submit a final EIS document.

This Appendix provides additional information to address several IRs provided by Environment and Climate Change Canada (ECCC) as part of the initial round of Federal Indigenous Review Team (FIRT) comments. These IRs were related to 16 wildlife species at risk (SAR) listed under Schedule 1 of the federal *Species at Risk Act* (SARA). The draft EIS approach was conservative in that it considered appropriate representative species as Valued Components (VCs) and Key Indicators (KIs) in sections 9.3 Ungulates, Furbearers, and Woodland Caribou and 9.4 Raptors, Migratory Breeding Birds, and Bird SAR. Of the 16 wildlife SAR listed in Table 1\_1, seven had been included as VCs or KIs in the EIS after a thorough scoping process (refer to Section 1.2 for additional information).

Nine of the sixteen were not included as individual VCs or KIs but are considered important from a regulatory perspective. The SARA-listed species identified by ECCC are listed in Table 1\_1. Those noted in bold font indicate those for which further assessment is provided in this appendix.

**Table 1-1-1 Wildlife Species at Risk Listed by Environment and Climate Change Canada**

Common Name	Scientific Name	Discussed in the <a href="#">Draft Section 9 of the draft EIS</a>
Nine-spotted lady beetle	<i>Coccinella ovemnotata</i>	No
Transverse lady beetle	<i>Coccinella transversoguttata</i>	No
Yellow-banded bumble bee	<i>Bombus terricola</i>	No
Northern leopard frog	<i>Lithobates pipiens</i>	No
Little brown myotis	<i>Myotis lucifugus</i>	No
Northern myotis	<i>Myotis septentrionalis</i>	No
Wolverine	<i>Gulo gulo</i>	Yes
Woodland caribou	<i>Rangifer tarandus caribou</i>	Yes
Bank Swallow	<i>Riparia riparia</i>	No
Barn Swallow	<i>Hirundo rustica</i>	No
Common Nighthawk	<i>Chordeiles minor</i>	Yes
Horned Grebe	<i>Podiceps auritus</i>	No
Olive-sided Flycatcher	<i>Contopus cooperi</i>	Yes

Common Name	Scientific Name	Discussed in the <a href="#">Draft-Section 9 of the draft EIS</a>
Rusty Blackbird	<i>Euphagus carolinus</i>	Yes
Short-eared Owl	<i>Asio flammeus</i>	Yes
Yellow Rail	<i>Coturnicops noveboracensis</i>	Yes

Of the 16 species listed in Table 1-1, seven had been included as VCs or KIs in the EIS after a thorough scoping process, as summarized below.

## 1.2 Valued Component Selection

The VCs considered in the effects assessment for the Project are aspects of the biophysical and human environments that were considered to be likely to be affected (adversely or positively) by the Project. The VCs reflect identified scientific, local knowledge, and Indigenous Knowledge, and community interests regarding the Project and its potential effects. The potential effects are typically identified early in the environmental assessment process as a result of questions and concerns raised through engagement with Indigenous and community groups, government departments and agencies, and the general public.

Denison reviewed and considered all received input to develop a VC list that reflects the key environmental, socio-economic, heritage, and human health components and interests to appropriately focus the EA.

The initial VCs selected to represent bird SAR in the habitat-based assessment that were provided in the Terms of Reference (Denison 2019) were evaluated, consolidated, and organized to allow for the logical assessment of Project effects, and are presented in Table 1-2 and Table 1-3, which formed the basis for the subsequent VC-specific assessment.

**Table 1-2 Wildlife Species at Risk Valued Component and Rationale for their Inclusion in the Habitat-based Environmental Assessment for the Denison Wheeler River Project**

Valued Component	Rationale
<b>Biophysical Environment</b>	
<b>Terrestrial Environment</b>	
Furbearers	Project activities and infrastructure may affect local furbearer populations, including species at risk (SAR), resulting in non-compliance with permit conditions (e.g., <i>Species at Risk Act</i> [SARA; Government of Canada 2022], <i>The Wildlife Act 1998</i> [Government of Saskatchewan 2020]).
Woodland Caribou	Project activities and infrastructure may affect woodland caribou populations, resulting in non-compliance with permit conditions (e.g., SARA [Government of Canada 2022], <i>The Wildlife Act, 1998</i> [Government of Saskatchewan 2020]).

Valued Component	Rationale
Bird Species at Risk	Project activities and infrastructure may affect bird SAR (specifically disturbance and/or destruction of eggs, young, and adults) resulting in non-compliance with regulatory requirements (e.g., SARA [Government of Canada 2022], <i>Migratory Birds Convention Act 1994</i> [Government of Canada 2017], <i>Saskatchewan Activity Restriction Guidelines for Sensitive Species</i> [Government of Saskatchewan 2017], <i>The Wildlife Act 1998</i> [Government of Saskatchewan 2020]).

**Table 1-3-3 Valued Components, Key Indicators, and Measurable Parameters for the Wildlife Component included in the Habitat-based Environmental Assessment for Denison Wheeler River Project**

Valued Component	Key Indicator	Measurable Parameter
Furbearers	Wolverine	Amount of habitat (km <sup>2</sup> ) (not necessarily occupied) that may be altered or lost relative to its availability in the Regional Study Area (RSA). The number of wolverine mortalities directly or indirectly attributable to the Project.
Woodland Caribou	Woodland caribou	Amount of habitat (km <sup>2</sup> ) (not necessarily occupied) that may be altered or lost relative to its availability in the RSA. The number of woodland caribou mortalities directly or indirectly attributable to the Project.
Bird Species at Risk	Common Nighthawk	Percentage of habitat for Common Nighthawk altered/lost directly or indirectly as a result of Project activities. The number of Common Nighthawk mortalities directly or indirectly attributable to the Project.
	Rusty Blackbird	Percentage of habitat for Rusty Blackbird altered/lost directly or indirectly as a result of Project activities. The number of rusty blackbird mortalities directly or indirectly attributable to the Project
	Olive-sided Flycatcher	Percentage of habitat for Olive-sided Flycatcher altered/lost directly or indirectly as a result of Project activities. The number of Olive-sided Flycatcher mortalities directly or indirectly attributable to the Project
	Short-eared Owl	Percentage of habitat for Short-eared Owl altered/lost directly or indirectly as a result of Project activities. The number of Short-eared Owl mortalities directly or indirectly attributable to the Project.

Valued Component	Key Indicator	Measurable Parameter
	Yellow Rail	<p>Percentage of habitat for Yellow Rail altered/lost directly or indirectly as a result of Project activities.</p> <p>The number of Yellow Rail mortalities directly or indirectly attributable to the Project.</p>

The five bird species identified in Table 1-3 were selected as SAR VCs for the habitat-based EA in consideration of information/responses received during extensive Indigenous and community engagement completed by Denison, and they represent wildlife species of local importance. For these five species, additional information is not be provided in this Appendix. Rather, the reader is referred to the applicable sections in the EIS where appropriate information on existing conditions (Section 9.4.3.3), potential project-related effects (Section 9.4.4), mitigation measures (Section 9.4.5), residual effects and their significance (Section 9.4.6), and cumulative effects (Section 9.4.7) is provided.

## 2 Supplemental Information

---

As requested by ECCC, the following subsections provide supplemental information for the remaining nine species listed in Table 2-1 that were not included as VCs or KIs in the EIS. For these nine species, a brief overview of life history requirements (existing environment), a discussion on the effects assessment and mitigation measures, and a summary of residual and cumulative effects are included.

Table 2-12-1 Wildlife Species At Risk Considered in the Wheeler River Project Environmental Impact Statement

Common Name	Scientific Name	Provincial Status	Federal Status <sup>1</sup>	Preferred Habitat	Documented Occurrence in the Local Study Area <sup>2</sup>	Reference in the Environmental Impact Statement (EIS)
Arthropods						
Nine-spotted lady beetle	<i>Coccinella novemnotata</i>	S4	Endangered	Habitat generalist – uses a diverse range of habitats and consumes a variety of prey. See Section 2.1.1 for further details.	Local Study Area (LSA) is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date.	Not included as a Valued Component (VC) in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.
Transverse lady beetle	<i>Coccinella transversoguttata</i>	S4	Special Concern	Habitat generalist – uses a diverse range of habitats and consumes a variety of prey. See Section 2.1.2 for further details.	LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date.	Not included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.
Yellow-banded bumble bee	<i>Bombus terricola</i>	S4	Special Concern	Habitat generalist – uses a variety of habitats and consumes nectar and pollen from many different flowering plants. See Section 2.1.3 for further details.	LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date.	Not included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.
Amphibians						
Northern leopard frog	<i>Lithobates pipiens</i>	S3	Special Concern	Three district habitats: (1) overwintering waterbodies that are cold, well oxygenated, and do not freeze to bottom; (2) breeding and larval waterbodies with shallow, open habitats, neutral pH, and no fish; and (3) summering areas in shallow	LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date. Amphibian nocturnal call	Not included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.

				marshes, moist upland meadows where grass height is less than 1 m. See Section 2.2.1 for further details.	and visual search surveys were completed in the LSA and Regional Study Area (RSA) as part of the baseline program; however, only boreal chorus frogs ( <i>Pseudacris maculata</i> ) were detected (Appendix 9-C).	
Bats						
Little brown myotis	<i>Myotis lucifugus</i>	S4B, S4N	Endangered	Seasonal habitat requirements: (1) overwintering hibernacula that are sufficiently cool and humid and (2) summering areas that provide foraging areas and suitable locations for roosting and maternity colonies. See Section 2.3.1 for further details.	Documented during the acoustic bat surveys as part of the baseline field program as present in the LSA and RSA, and previously observed in the RSA (SKCDC 2023).	Not included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.
Northern myotis	<i>Myotis septentrionalis</i>	S3	Endangered	Seasonal habitat requirements: (1) overwintering hibernacula that are sufficiently cool and humid and (2) summering areas that provide foraging areas and suitable locations for roosting and maternity colonies. See Section 2.3.2 for further details.	Documented during the acoustic bat surveys as part of the baseline field program as present in the LSA and RSA (Appendix 9-C).	Not included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.

Common Name	Scientific Name	Provincial Status	Federal Status <sup>1</sup>	Preferred Habitat	Documented Occurrence in the Local Study Area <sup>2</sup>	Reference in the Environmental Impact Statement (EIS)
Terrestrial Wildlife Species						
Wolverine	<i>Gulo gulo</i>	S2	Special Concern	See Section 9.3.3.2 of the EIS for details.	LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date.	Included as a Key Indicator (KI) of the Furbearer VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Woodland caribou	<i>Rangifer tarandus caribou</i>	S3	Threatened	See Section 9.3.3.3 of the EIS for details.	Documented within the RSA during the baseline field program (Appendix 9-C)	Included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Avian Species						
Bank Swallow	<i>Riparia riparia</i>	S4B, S5M	Threatened	Nesting colonies are typically characterized by steep embankments with a sand, silt, or clay substrate that can be easily excavated for burrows. They are often adjacent to slow-moving or still waterbodies and may occur in natural habitats or in anthropogenic features. Bank Swallows are aerial insectivores that forage over a variety of open habitats. See Section 2.4.1 for further details.	LSA is located within COSEWIC range; no historical observations documented by the SKCDC (2023) and no Project-specific observations to date.	Not included as a KI of the Bird Species at Risk (SAR) VC in the EIS (Common Nighthawk was used as a surrogate species). A review of life history requirements and discussion on effects assessment are included in this Appendix. Any new species-specific mitigation measures identified in this appendix will be added to the final EIS (Section 9.4.5).
Barn Swallow	<i>Hirundo rustica</i>	S4B	Threatened	Breeding habitat typically requires a suitable nesting site with a vertical or horizontal surface underneath a roof of	Documented during the breeding bird surveys as part of the baseline field	Not included as a KI of the Bird SAR VC in the EIS (Common Nighthawk was used as a surrogate species). A review of life history

				some sort, open areas for foraging, and a waterbody with mud for nest building. Anthropogenic features such as barns, houses, bridges, and culverts are commonly used nesting sites. See Section 2.4.2 for further details.	program as present in the LSA (Appendix 9-C), and previously observed in the RSA (SKCDC 2023)	requirements and discussion on effects assessment are included in this Appendix. Any new species-specific mitigation measures identified in this appendix will be added to the final EIS (Section 9.4.5).
Common Nighthawk	<i>Chordeiles minor</i>	S4B	Special Concern	See Section 9.4.3.3 of the EIS for details.	Documented during the baseline field program as present in the LSA (Appendix 9-C), and previously observed in the RSA (SKCDC 2023)	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Horned Grebe	<i>Podiceps auritus</i>	S5B	Special Concern	Breeding habitat consists of small to medium-sized freshwater lakes, ponds, and marshes that are shallow with open water (at least 40%), emergent vegetation, anchorage for nests, and concealment for nests and young. See Section 2.4.3 for further details.	Documented during the baseline field program as present in the LSA (Appendix 9-C).	Not included as a KI of the Bird SAR VC in the EIS (Yellow Rail was used as a surrogate species). A review of life history requirements and discussion on effects assessment are included in this Appendix. Any new species-specific mitigation measures identified in this appendix will be added to the final EIS (Section 9.4.5).
Olive-sided Flycatcher	<i>Contopus cooperi</i>	S4B	Special Concern	See Section 9.4.3.3 of the EIS for details.	Documented during the baseline field program as present in the LSA (Appendix 9-C), and previously observed in the RSA (SKCDC 2023)	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.

Common Name	Scientific Name	Provincial Status	Federal Status <sup>1</sup>	Preferred Habitat	Documented Occurrence in the Local Study Area <sup>2</sup>	Reference in the Environmental Impact Statement (EIS)
Rusty Blackbird	<i>Euphagus carolinus</i>	S3B, SUN	Special Concern	See Section 9.4.3.3 of the EIS for details.	LSA is located within COSEWIC range; no historical observations documented by the SKCDC (2023) and no Project-specific observations to date.	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Short-eared Owl	<i>Asio flammeus</i>	S3B, S2N	Special Concern	See Section 9.4.3.3 of the EIS for details.	LSA is located within COSEWIC range; no historical observations documented by the SKCDC (2023) and no Project-specific observations to date.	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Yellow Rail	<i>Coturnicops noveboracensis</i>	S3B	Special Concern	See Section 9.4.3.3 of the EIS for details.	LSA is located within COSEWIC range; no historical observations documented by the SKCDC (2023) and no Project-specific observations to date.	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.

Note: shaded rows indicate SAR was included as a VC or KI in the draft EIS

- 1 Schedule 1 under the *Species at Risk Act*.
- 2 Potential for Occurrence – based on known species occurrence data from Saskatchewan Conservation Data Centre (2023), Omnia (Appendix 9-C), Birds of Saskatchewan (2019), and Atlas of Saskatchewan Birds (Smith 1996) and/or presence of suitable habitat.

## 2.1 Arthropods

### 2.1.1 Nine-Spotted Lady Beetle

The nine-spotted lady beetle is a small beetle species found across southern Canada and the continental United States (COSEWIC 2016a). Its northern range limit in Saskatchewan is reported to occur near Lake Athabasca (COSEWIC 2016a). Based on records provided by the Saskatchewan Conservation Data Centre Hunting, Angling and Biodiversity of Saskatchewan (HABISask) database (SKCDC 2023), there are no historical observations of this species documented in the Regional Study Area (RSA).

Source: COSEWIC (2016a).

The nine-spotted lady beetle is a habitat generalist that uses a diverse range of habitats (e.g., open to semi-open forests, grasslands, riparian areas) and consumes a variety of prey (e.g., many species of arthropods [particularly aphids], sap, nectar and pollen) (COSEWIC 2016a). Being a habitat generalist allows the nine-spotted lady beetle to exploit seasonally available prey sources, with prey availability influencing the species' distribution more than habitat availability (COSEWIC 2016a).

The nine-spotted lady beetle has four life stages (i.e., egg, larva, pupa, and adult) and may produce two generations per year (i.e., spring and fall) depending on regional climate conditions (COSEWIC 2016a). Lady beetles, in general, are highly mobile and may undertake short (few hundred metres) and long-distance (18 to 120 km) movements (COSEWIC 2016a). The nine-spotted lady beetle is not migratory nor does it display strong site fidelity (COSEWIC 2016a). The nine-spotted lady beetle overwinters in aggregations in well-ventilated habitats (e.g., in rock crevices, grass tussocks, or leaf litter, or under stones or tree bark), becoming active in the early spring when temperatures start to increase (COSEWIC 2016a).

The nine-spotted lady beetle is federally listed under Schedule 1 of SARA as Endangered (Government of Canada 2023) and is designated as an S4 species in Saskatchewan (i.e., Apparently Secure) (Saskatchewan Conservation Data Centre 2023). The species has undergone significant population declines in Canada since 1975, going from one of the more common lady beetles collected to being rarely collected relative to other lady beetles, despite comprehensive and targeted surveys (COSEWIC 2016a). Reasons for these population declines are currently unknown but are thought to be driven by competition, predation, and introduced diseases from non-native species (including non-native lady beetles), agricultural pesticide use to control aphids, habitat loss via urban expansion, and other human disturbances (COSEWIC 2016a).

### 2.1.2 Transverse Lady Beetle

The transverse lady beetle is a small beetle species found across the United States and Canada, including all provinces and territories (COSEWIC 2016b). The species is a habitat generalist and uses similar habitat types and consumes similar prey as the nine-spotted lady beetle, which means it is also able to exploit seasonally available prey sources (COSEWIC 2016b). According to the information from the HABISask database, there are no historical observations of this species documented in the RSA.

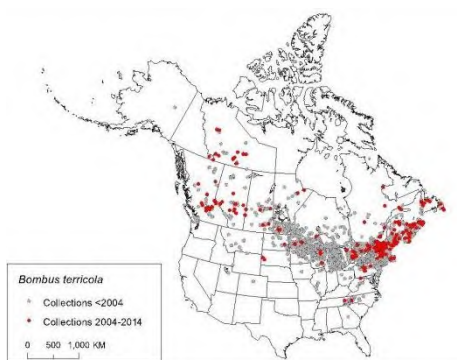

Source: COSEWIC (2016b).

The transverse lady beetle has four life stages (i.e., egg, larva, pupa, and adult) and may produce two generations per year (i.e., spring and fall) depending on regional climate conditions (COSEWIC 2016b). Lady beetles in general are highly mobile and may undertake short (few hundred metres) and long-distance (18 to 120 km) movements (COSEWIC 2016b). The transverse lady beetle is not migratory nor does it display strong site fidelity (COSEWIC 2016b). The transverse lady beetle overwinters in aggregations in well-ventilated habitats (e.g., in rock crevices, grass tussocks, or leaf litter, or under stones or tree bark), becoming active in the early spring when temperatures start to increase (COSEWIC 2016b).

The transverse lady beetle is federally listed under Schedule 1 of SARA as Special Concern (Government of Canada 2023) and is designated as an S4 species in Saskatchewan (i.e., Apparently Secure) (Saskatchewan Conservation Data Centre 2023). The species was once abundant across its range in Canada and was one of the most common lady beetles collected; however, since 1986, the species is now absent, below detection limits, or present in low numbers in many parts of its range (COSEWIC 2016b). The transverse lady beetle has not been detected in Saskatchewan since 2001 (COSEWIC 2016b). Reasons for these population declines are currently unknown but are thought to be driven by the same factors listed for the nine-spotted lady beetle in Section 2.1.1.

### 2.1.3 Yellow-banded Bumble Bee

The yellow-banded bumble bee is a medium-sized bumble bee species found throughout eastern North America, from eastern British Columbia (BC) to Newfoundland and Labrador and from the northern United States up to the southern portion of the territories (COSEWIC 2015). The species is a habitat generalist (e.g., boreal habitats, mixed woodlands, montane meadows) and consumes nectar and pollen from many different flowering plants (COSEWIC 2015). According to the information from the HABISask database, there are no historical observations of this species documented in the RSA.

Source: COSEWIC (2015).

The yellow-banded bumble bee has four life stages (i.e., egg, larva, pupa, and adult) and produces one generation per year, with mated queens establishing new colonies each year (COSEWIC 2015). After overwintering underground in loose soil or decomposing organic material, the mated queens emerge in the spring and search for potential nest sites, which are typically located underground in existing cavities (e.g., abandoned rodent burrows, rotten logs, openings in dead wood, and grassy hummocks) (COSEWIC 2015). Once a queen has found a suitable nest site, she forages for nectar and pollen and then returns to her nest site to lay eggs, which will develop into her future workers (i.e., unmated daughters that do not typically reproduce) (COSEWIC 2015). After the initial eggs hatch and the larva and pupa develop into adult workers, the workers take over nest and brood care, foraging duties, and colony protection while the queen continues to lay eggs (COSEWIC 2015). Males and potential queens are produced by late summer once the colony reaches maximum worker production, at which point they leave the colony and mate (COSEWIC 2015). All males and workers die by fall while the mated queens hibernate through the winter in suitable overwintering sites (COSEWIC 2015).

The yellow-banded bumble bee is federally listed under Schedule 1 of SARA as Special Concern (Government of Canada 2023) and is designated as an S4 species in Saskatchewan (i.e., Apparently Secure)

(Saskatchewan Conservation Data Centre 2023). Prior to the 1990s, the yellow-banded bumble bee was one of the more common bumble bees collected in eastern and boreal Canada (COSEWIC 2015, Environment and Climate Change Canada 2022a). Population declines started to occur in the early 1990s, with an average rate of decline of 66.5% in proportional abundance across central and southern Canada between 1992 and 2011 (COSEWIC 2015, Environment and Climate Change Canada 2022a). The species is no longer found at several historical collection sites (COSEWIC 2015).

The status of the yellow-banded bumble bee in boreal habitats and Arctic regions is unknown (COSEWIC 2015, Environment and Climate Change Canada 2022a). Reasons for these population declines are currently unknown but are thought to be driven by introduced diseases from managed bumble bee species, agricultural pesticide use, habitat loss via urban and agricultural expansion, and climate change (COSEWIC 2015). The species' unique type of sex determination, where colonies must reach maximum worker production to produce males and potential queens, has been identified as a limiting factor (COSEWIC 2015, Environment and Climate Change Canada 2022a).

## 2.2 Amphibians

### 2.2.1 Northern Leopard Frog

The northern leopard frog is found across most of west-central and northeastern North America (COSEWIC 2009a). The species is widespread in Canada, ranging from southeastern BC to Labrador, and from southcentral Northwest Territories (COSEWIC 2009a, NCC 2023).

Source: COSEWIC (2009a).

Three distinct habitats are used by the northern leopard frog on an annual basis: (1) overwintering waterbodies that are cold, well oxygenated, and do not freeze to bottom (e.g., rivers, streams, deep lake ponds and creeks, and spillways below dams); (2) breeding and larval waterbodies with shallow, open habitats (e.g., ponds, lakeshores, marshes, and slow-moving streams; may be permanent or semi-permanent), neutral pH, well vegetated, and no fish; and (3) summering areas in shallow marshes, moist upland meadows, forests and grasslands where grass height is less than 1 m (COSEWIC 2009a, NCC 2023). These habitats must be in proximity with suitable dispersal corridors interconnecting them (e.g., riparian areas and waterways) as the species is not capable of long-distance movements (COSEWIC 2009a, Environment Canada 2013).

Northern leopard frogs emerge from their overwintering waterbodies in early spring shortly after ice off (COSEWIC 2009a). The breeding season extends from mid-April to June, with exact timing dependent on location and latitude (COSEWIC 2009a). Females lay several thousand eggs, attaching them to submerged vegetation, which develop into tadpoles within two weeks depending on water temperatures (COSEWIC 2009a). The tadpoles in turn develop into small frogs over a two-to-three-month period, after which they migrate to their summering areas and forage on a variety of arthropods, worms, and snails, sometimes preying on small birds and smaller frogs (COSEWIC 2009a).

Three populations are recognized for the northern leopard frog in Canada: the Rocky Mountain, the Western Boreal/Prairie, and the Eastern (COSEWIC 2009a, NCC 2023). The Western Boreal/Prairie population is found in Alberta, Saskatchewan, Manitoba, and the Northwest Territories (COSEWIC 2009a,

NCC 2023). The Western Boreal/Prairie population is federally listed under Schedule 1 of SARA as Special Concern (Government of Canada 2023) and is designated as an S3 species in Saskatchewan (i.e., Vulnerable) (Saskatchewan Conservation Data Centre 2023).

Population data are limited for the northern leopard frog in Canada (COSEWIC 2009a, Environment Canada 2013). Large-scale population declines occurred in the early 1970s, with populations in western Canada (i.e., BC and Alberta) most dramatically affected (COSEWIC 2009a). Information is lacking on the current status of northern leopard frog populations in Saskatchewan (COSEWIC 2009a, Environment Canada 2013).

Threats to the northern leopard frog include emerging diseases (e.g., *Chytridiomycosis*), introduced non-native species, habitat loss and fragmentation, environmental contamination, and increased frequency and severity of droughts (COSEWIC 2009a). The species' specific habitat requirements and vulnerability to diseases and prolonged periods of drought have been identified as limiting factors (Environment Canada 2013).

## 2.3 Bats

### 2.3.1 Little Brown Myotis

The little brown myotis is a small bat species found across North America, including across Canada south of the treeline (COSEWIC 2013a). The species is considered a short-distance regional migrant between its summer and winter ranges, with the distance travelled dependent on the location of suitable overwintering hibernacula (COSEWIC 2013a).

Habitat for the little brown myotis is composed of (1) overwintering hibernacula that are sufficiently cool and humid and (2) summering areas that provide foraging areas and suitable locations for roosting and maternity colonies (COSEWIC 2013a). Hibernacula and maternity sites are the main limiting habitat features for this species (COSEWIC 2013a). Hibernacula occur in parts of caves, mines, and buildings that have stable and specific temperature (-4 to 13°C) and humidity (>80%) conditions (COSEWIC 2013a). Maternity sites occur in large-diameter trees, rock crevices, buildings, and bat houses that offer warm and relatively stable microclimate conditions that allow females to avoid going into torpor so they can focus on caring for their young (COSEWIC 2013a, Slough and Jung 2020). Males are more versatile in their summer roosting requirements and use tree cavities, raised bark, foliage, rock crevices, buildings, and bridges with a broader range of microclimate conditions (COSEWIC 2013a, Johnson et al. 2019). Foraging areas for the little brown myotis include a variety of habitats situated close to roosting and maternity sites, including over water (e.g., wetlands, lakes, ponds, and rivers), along riparian areas and forest edges, and in forest gaps (COSEWIC 2013a).

The little brown myotis is federally listed under Schedule 1 of SARA as Endangered (Government of Canada 2023) and is designated as an S4B, S4N species in Saskatchewan (i.e., Apparently Secure breeding population, Apparently Secure non-breeding population) (Saskatchewan Conservation Data Centre 2023).

Source: COSEWIC (2013a).

The current size of the little brown myotis population in Canada is unknown. Prior to the arrival of White-nose Syndrome in 2010, the population in Canada was estimated to be over one million individuals (COSEWIC 2013a, Environment and Climate Change Canada 2018). White-nose Syndrome is a disease that causes high rates of mortality among hibernating bats, and it has been identified as the main threat for bat populations in Canada (COSEWIC 2013a). Other threats to the little brown myotis include habitat loss, colony eradication, chemical contamination, and wind turbines (COSEWIC 2013a).

### 2.3.2 Northern Myotis

The northern myotis is a small bat species found across North America, including across Canada south of the treeline (COSEWIC 2013a). The species is considered a short-distance regional migrant between its summer and winter ranges, with the distance travelled dependent on the location of suitable overwintering hibernacula (COSEWIC 2013a).

Habitat for the northern myotis is composed of (1) overwintering hibernacula that are sufficiently cool and humid and (2) summering areas that provide foraging areas and suitable locations for roosting and maternity colonies (COSEWIC 2013a). Hibernacula and maternity sites are the main limiting habitat features for this species (COSEWIC 2013a). Hibernacula occur in parts of caves, mines, and buildings that have stable and specific temperature (0.6 to 14°C) and humidity (>80%) conditions (COSEWIC 2013a). Summer roosting trees are typically found in mature to old-growth forests, swamps, and riparian areas, although retained older trees and snags in younger forests may occasionally provide suitable roosting habitat (Environment and Climate Change Canada 2018). Females strongly prefer tall, large-diameter trees (both living and dead, typically deciduous) with early- to mid-decay for maternity sites (COSEWIC 2013a, Environment and Climate Change Canada 2018). Anthropogenic features (e.g., barns) may occasionally be used as maternity sites in fragmented landscapes with few potential roost trees (Environment and Climate Change Canada 2018). Maternity sites that maintain warm and relatively stable microclimate conditions are important to reproductive females and young as they allow more energy to be directed toward growth and development (Caceres and Barclay 2000, COSEWIC 2013a). Males are more versatile in their summer roosting requirements; they most frequently roost under exfoliating, raised bark but may also roost in the cavities and crevices of trees and snags with early- to mid-decay (Jung et al. 2004, COSEWIC 2013a).

The northern myotis is well adapted to flying in areas of dense or structurally complex vegetation where it catches flying insects on the wing or feeds by gleaning prey from foliage (Caceres and Barclay 2000, Henderson and Broders 2008). The species typically forages within the interior of mature to old-growth deciduous and mixedwood forests, but may also forage in forest gaps, along forest edges and riparian areas, and over rivers (Henderson and Broders 2008, COSEWIC 2013a).

The northern myotis is federally listed under Schedule 1 of SARA as Endangered (Government of Canada 2023) and is designated as an S3 species in Saskatchewan (i.e., Vulnerable) (Saskatchewan Conservation Data Centre 2023). The current size of the northern myotis population in Canada is unknown. Prior to the arrival of White-nose Syndrome in 2010, the population in Canada was estimated to be over one million individuals (COSEWIC 2013a, Environment and Climate Change Canada 2018). White-nose Syndrome has

Source: COSEWIC (2013a).

been identified as the main threat for northern myotis populations in Canada (COSEWIC 2013a). . Other threats to the northern myotis include habitat loss, colony eradication, chemical contamination, and wind turbines (COSEWIC 2013a).

## 2.4 Avian Species

### 2.4.1 Bank Swallow

The Bank Swallow is a small songbird that occurs on every continent (except Antarctica and Australia), breeds throughout Canada, and winters primarily in South America (COSEWIC 2013b). Nesting colonies are typically characterized by steep embankments with a sand, silt, or clay substrate that can be easily excavated for burrows (COSEWIC 2013b, Government of Canada 2019a). These steep sand, silt, or clay embankments are frequently subject to erosion or slumping (COSEWIC 2013b, Garrison and Turner 2020).

Nesting colonies are often adjacent to slow-moving or still waterbodies (e.g., low gradient rivers or lakes) and may occur in natural habitats or in anthropogenic features (e.g., quarries or road cuts) (COSEWIC 2013b, Government of Canada 2019a, Garrison and Turner 2020). Colony size can range from less than half a dozen burrows to hundreds or thousands of burrows (COSEWIC 2013b, Government of Canada 2019a). Individual burrows within colonies may be recolonized in subsequent years if the integrity of the colony remains intact (i.e., does not erode and collapse) (Garrison and Turner 2020). Bank Swallows are aerial insectivores that forage over a variety of open habitats such as lakes, ponds, rivers, wetlands, grasslands, and agricultural areas (COSEWIC 2013b, Garrison and Turner 2020).

The Bank Swallow is federally listed under Schedule 1 of SARA as Threatened (Government of Canada 2023) and is designated as an S4B, S5M species in Saskatchewan (i.e., Apparently Secure breeding population, Secure aggregating transient population [migrants]) (Saskatchewan Conservation Data Centre 2023). The most recent breeding population estimate for Canada is 2.4 million individuals (Environment and Climate Change Canada 2022b). Based on Breeding Bird Survey (BBS) data collected between 1970 and 2019, the Bank Swallow population in Canada has declined at a rate of 5.3% per year, for an overall decline of 98.0% (Environment and Climate Change Canada 2022b). The long-term population decline appears to be driven by several threats acting cumulatively, including loss of nesting and foraging habitats, incidental take during anthropogenic activities (e.g., aggregate extraction and erosion control), large-scale declines in aerial insect populations, and climate change (COSEWIC 2013b). Bank Swallows are also particularly vulnerable to collisions with vehicles partly due to the attraction of individuals to intraspecific carcasses; one swallow hit by a vehicle could attract several individuals to a road, potentially resulting in subsequent collisions and large mortality events (COSEWIC 2013b, Garrison and Turner 2020).

Although colonial nesting may provide advantages (e.g., predation protection and assistance with thermoregulation), it has been identified as a limiting factor for the Bank Swallow, potentially making

Source: COSEWIC (2013b).

them more vulnerable to natural events or anthropogenic activities, which may result in mass mortality events (Environment and Climate Change Canada 2022b).

#### 2.4.2 Barn Swallow

The Barn Swallow is a medium-sized songbird that occurs on every continent (except Antarctica), breeds throughout Canada, and winters in the southern United States, Mexico, and southwards (COSEWIC 2021a). Breeding habitat typically requires a suitable nesting site with a vertical or horizontal surface underneath a roof of some sort, open areas for foraging (e.g., grasslands, fields, wetlands, and shorelines), and a waterbody with mud for nest building (Government of Canada 2019b, Brown and Brown 2020, COSEWIC 2021a). Historically, suitable nesting sites were likely provided by caves, cliff faces, rock ledges, tree branches, and hollow trees (Brown and Brown 2020, COSEWIC 2021a). Today, nesting sites are usually located within agricultural and rural areas, and along roads and highways (Brown and Brown 2020, COSEWIC 2021a). Anthropogenic features such as barns, houses, bridges, and culverts are commonly used for nesting sites (COSEWIC 2021a). Barn Swallows nest in colonies or independently and typically return to the same nesting sites each year and may reuse old nests (Government of Canada 2019b, Brown and Brown 2020, COSEWIC 2021a).

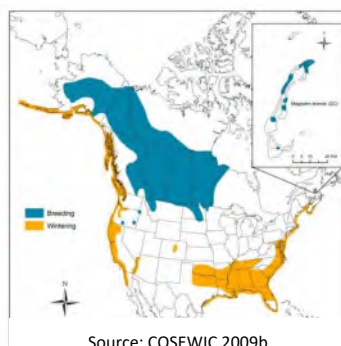

Source: COSEWIC (2021).

The Barn Swallow is federally listed under Schedule 1 of SARA as Threatened (Government of Canada 2023) and is designated as an S4B species in Saskatchewan (i.e., Apparently Secure breeding population) (Saskatchewan Conservation Data Centre 2023). An estimated 6.4 million individuals currently breed in Canada, with over 60% of the population breeding throughout the prairie provinces (COSEWIC 2021a). Based on BBS data collected between 1970 and 2019, the Barn Swallow population in Canada has declined at a rate of 2.34% per year, for an overall decline of 68.6% (COSEWIC 2021a). Intensification of agriculture, loss of nesting sites, large-scale declines in aerial insect populations, and climate change are cited as the most imminent threats for the Barn Swallow, and its dependence on aerial insects for prey and low post-fledging survival rates are cited as limiting factors for the species (COSEWIC 2021a). The repeated use of anthropogenic features for nesting makes Barn Swallows vulnerable to incidental take, especially if the anthropogenic features require routine maintenance. In addition, their frequent use of anthropogenic features for nesting makes Barn Swallows vulnerable to entrapment (e.g., buildings, pipes, vents, other enclosed spaces) as they search for potential locations to build a nest (COSEWIC 2021a).

#### 2.4.3 Horned Grebe

The Horned Grebe is a small waterbird that occurs in North America and Eurasia (COSEWIC 2009b). Within North America, the species breeds across western Canada from BC to Yukon across to the Magdalen Islands in Quebec and winters along the Pacific and Atlantic coasts (COSEWIC 2009b).

Breeding habitat for the Horned Grebe consists of small to medium-sized freshwater lakes, ponds, and marshes that are shallow with open water (at least 40%), emergent vegetation,

Source: COSEWIC 2009b

anchorage for nests, and concealment for nests and young (COSEWIC 2009b, Stedman 2020). Horned Grebes use a range of waterbody sizes for breeding, but typically prefer waterbodies between 0.3 and 2.0 ha in size (COSEWIC 2009b). Most pairs are solitary, but loose colonies of up to 20 pairs have been found on larger waterbodies with abundant food resources (COSEWIC 2009b, Stedman 2020). Nests are typically located in shallow water near shore on a floating or emerging mass of vegetation (COSEWIC 2009b). Horned Grebes are diving birds that feed on a variety of aquatic arthropods and fish (COSEWIC 2009b, Stedman 2020).

The Western population of the Horned Grebe is federally listed under Schedule 1 of SARA as Special Concern (Government of Canada 2023) and is designated as an S5B species in Saskatchewan (i.e., Secure breeding population) (Saskatchewan Conservation Data Centre 2023). An estimated 200,000 to 500,000 individuals occur in the Western population, with most breeding in southern Alberta and Saskatchewan (COSEWIC 2009b, Environment and Climate Change Canada 2022c). Based on BBS data collected between 1970 and 2019, the Western population of the Horned Grebe in Canada has declined at a rate of 1.7% per year, for an overall decline of 57.0% (Environment and Climate Change Canada 2022c). The reasons for this population decline are unknown. Probable threats include permanent habitat loss, temporary loss of habitat during droughts, eutrophication and degradation of habitat due to fertilizers, predator expansion on the prairies, Type E botulism in the Great Lakes, entanglement in commercial fishing gear, climate change and extreme weather, and oil spills on wintering grounds (COSEWIC 2009b).

## 3 Mitigation Measures

The Project will require the construction, operation, and decommissioning of several components (as described in Section 2 of the EIS). Expected interactions between these Project components and activities and the wildlife VCs and their associated KIs are summarized by Project phase and activity in Tables 9.3-6 and 9.4-5 of the EIS. Based on the timing and nature of interactions identified in Tables 9.3-6 and 9.4-5 of the EIS, the following adverse effects on the wildlife VCs, including SAR, are likely to occur during the lifetime of the Project:

- alteration and/or loss of habitat; and
- change in mortality.

These potential effects apply to Wildlife SAR as well. The potential effects are described in Sections 9.3.4.2 and 9.4.4.2 of the EIS for each Project phase as they may affect the wildlife VCs and associated KIs.

Mitigation in this EIS is defined as the elimination, reduction, or control of potential adverse effects of the Project on the environment throughout all Project phases. Project-specific mitigation measures include: Project design; implementation of best management practices; development of management plans; implementation of emergency response programs; and provision of training, education and awareness (Denison 2020). Mitigation measures for each potential effect are described in Sections 9.3.5 and 9.4.5 of the EIS. The following subsections summarize mitigation measures that will be implemented to avoid or minimize adverse effects on the Wildlife SAR.

### 3.1 Project Design Measures

Potential adverse effects on Raptors, Migratory Breeding Birds, and Bird SAR VCs will be avoided or minimized to the extent practical through Project design. All of the Project design measures listed here are consistent with those presented in Section 9 of the EIS (i.e., there are no new Project design measures proposed in this appendix):

- The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent practicable resulting in reduced habitat disturbance and noise propagation.
- Much of the proposed footprint will be developed within previously disturbed areas, including roads currently used for exploration activities, thereby minimizing additional habitat disturbance.
- The powerline to the main substation at the site is relatively short (i.e., approximately 7 km) and will be constructed from the existing provincial power line adjacent to Highway 914.
- During Operation, progressive reclamation activities will be completed where possible, and the progress and success of these activities will be assessed annually.
- Cleared brush will be stockpiled when possible, to be used in progressive reclamation.
- Ongoing decommissioning of Project components will be completed when possible.
- Dust deposition on vegetation and waterbodies (including potential deposition of trace metals and radionuclides) will be reduced by:
  - directing processing plant exhaust from drying and packaging areas through a stack prior to release outside of the building;
  - designing the stack height based on results of air dispersion modelling to be an appropriate height for optimal dispersion;

- controlling access to the property with both a north and south security gate (the north gate is on a decommissioned road and the south gate is manned);
  - making a wash bay available to clean items, equipment and vehicles that may have been in contact with potentially contaminated materials. Contaminated water from the wash bay will be collected in a sump tank and routed to the water treatment plant for treatment and discharge;
  - conducting radiological clearance scanning as required for any items, equipment, and vehicles leaving the Project Area; and
  - watering and traffic controls on roads.
- Battery-powered light vehicles and mobile equipment, and an AC powered dual rotary drill for ISR wellfield development instead of a traditional diesel-powered unit, will be employed, where practical, to reduce air emissions and noise levels and improve energy efficiency.
  - The main sources of noise will be related to transport of people and goods, drilling of holes for the freeze wall and wellfield, operation of the batch plant, operation of the processing plant, and operation of the pumphouses. The use of high-quality, low sound emission equipment and regular maintenance will reduce noise associated with Project activities.
  - Bulk storage tanks for processing chemicals such as sulphuric and/or hydrochloric acid, sodium hydroxide, and hydrogen peroxide will sit inside appropriately designed and sized secondary containment basins, physically separated from the containment basins for other chemical systems.
  - Surface pipelines will be designed to have secondary containment or catchment and have leak detection systems in place at key locations.
  - A freeze wall will be established around the uranium deposit to reduce groundwater disturbance.
  - Mining solution and process water will be reused throughout the mining process, reducing water use requirements to the extent feasible and reducing the volume of treated effluent requiring discharge. Make-up water will be preferentially sourced from site runoff where possible.
  - Double-walled, high-density polyethylene or equivalent piping will be used in the wellfields and will be freeze protected and secured to minimize pipe movement.
  - Contaminated wastes (e.g., mineralized drill cuttings, solid impurities removed from mining solution, dewatered reject solids) will be properly contained on a double lined waste pad with leak detection capabilities and an associated monitoring program. An adjacent pond will be used to collect runoff from the pad and water in the waste pond will be piped to the water treatment plant. Such waste will be disposed of either on site or off site at an approved facility.
  - The ISR wellfield and processing plant will be designed to re-use most of the solutions inside each circuit; any excess water will be released to a surface water body once acceptable water quality is achieved. All treated effluent released to surface water will meet federal and provincial regulatory discharge limits.
  - All contaminated areas, such as waste ponds and pads, and the domestic landfill will be fenced to avoid contact with workers and wildlife. Fences will be monitored and maintained.

## 3.2 General Mitigation Measures for Wildlife Species at Risk

Mitigation measures specific to the Wildlife SAR, in accordance with the *Migratory Birds Convention Act* and tailored to Project features will be incorporated into various Project management and monitoring plans such as the erosion and sediment controls, soil and vegetation monitoring, wildlife monitoring, the Decommissioning Plan, air quality monitoring, Spill Response Plan, Radiation Protection Plan, surface water and effluent monitoring and Waste Management Plan.

The management plans within the Environmental Management System (EMS) will provide specific mitigation measures based on proven and accepted mitigation measures following standard industry guidelines and best management practices. The EMS will provide guidance to avoid or minimize potential adverse effects of the Project on avian species and their habitat, including monitoring and follow-up programs, as appropriate. It will be in place during all phases of the Project and will be subject to ongoing review and revision as required. If monitoring identifies a need for additional or revised mitigation measures, a process of adaptive management (as described in the plan) will be triggered. The Project management plans provide direction on monitoring and adaptive management so that responses are timely and effective.

The following subsections provides a description of the mitigation measures that will be applicable during all Project phases and expected to be effective immediately following implementation. ~~Additional mitigation measures specific to the Wildlife SAR that were not included or that were revised from what was described in the draft EIS are provided in bold text.~~

### 3.2.1 Work Timing Windows and Habitat Disturbance

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the nesting season, when practical. **The nesting season for many Wildlife SAR in Saskatchewan spans a period from March 15 to August 31; however, the dates differ for certain species. The Wildlife Management Plans within the EMS will provide details on nesting windows for avian species, as well as other sensitive time periods (e.g., caribou calving periods) occurring in the Terrestrial RSA based on the Saskatchewan Activity Restriction Guidelines for Sensitive Species (SARGSS), which were established to support the avoidance of sensitive species' habitats during sensitive periods (SK MOE 2017).**
- **Prior to commencing any site clearing (i.e., vegetation clearing and/or soil disturbance) during the nesting and breeding season, pre-disturbance wildlife clearance surveys will be conducted a** by a Qualified Professional (QP) at that location within the Project Area to identify sensitive species and habitat features (e.g., nests as well as roosts and hibernacula used by bat species).
- Active and/or suspected breeding and roosting locations identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with regulatory guidelines (e.g., the 2017 SARGSS [SK MOE 2017]) in accordance with the level of the disturbance and species until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations). If guidelines cannot be met, due to safety or operational concerns, SK MOE will be contacted for advice on the appropriate response to the situation.
- In addition to the species listed under Schedule 1 of SARA, if any features (e.g., nests) of species included on the Saskatchewan Activity Restriction Guidelines for Sensitive Species (SK MOE 2017) are observed during the pre-clearing wildlife surveys, the applicable activity restrictions will be implemented, as appropriate, following discussion with SK MOE.

Formatted: Font: Not Bold

Formatted: Font: Not Bold

Formatted: Font: Not Bold

### 3.2.2 Wildlife Education and Awareness

- Employees and contractors will be provided with wildlife education and awareness training, including education about potential Wildlife SAR issues on site and training on the mitigation measures to avoid or minimize potential adverse Project effects on Wildlife SAR and their habitats.
- Employees and contractors will be educated on waste management policies that limit human-avian interactions.
- Designated employees will be trained in appropriate avian deterrent techniques to minimize avian interactions with the Project.
- Employees and contractors will be requested to report avian observations on site, injured or dead birds (which will be reported to SK MOE). Avian encounters and outcomes will be monitored, and logbooks will be used to record observations. Logbooks and reports will be available to employees.

Formatted: Font: Not Bold

### 3.2.3 Wildlife and Habitat Protection

- Personal firearms will be prohibited for employees and contractors within the Project Area to prevent hunting activities.
- If any individual were seeking access around the Project area to undertake Aboriginal and/or Treaty Rights, Denison staff would facilitate this, provided it were safe to do so given activities in the area.
- Policies will be implemented prohibiting employees and contractors from feeding, approaching, or harassing avian species within the Project Area.
- To support habitat regeneration, progressive reclamation and ecosystem-based revegetation will be conducted on disturbed areas as soon as practicable in accordance with the Reclamation and Closure Plan.

### 3.2.4 Wildlife Deterrence and Prevention of Wildlife Entrapment

- Buildings and other Project infrastructure will be designed and maintained to exclude birds (e.g., barn swallows) and bats as much as possible. This would include installing solid barriers (e.g., corner slope panels, wooden panels) or flexible barriers (e.g., netting, tarps or geotextiles) under roof eaves or other exterior surfaces.
- Physical, visual, and/or auditory deterrents will be used to discourage bird and bat use of buildings and other Project infrastructure (e.g., water or waste treatment ponds) for refuge, shelter, breeding, and roosting, and to deter birds and bats from potentially becoming entrapped.
- Noise emitting Project activities will be managed to minimize sensory disturbance of wildlife SAR species, especially during sensitive time periods (i.e., breeding and nesting).
- Low sound emission equipment, regular maintenance of equipment, and the use of silencers or mufflers (whenever practical) will be used to reduce noise associated with Project activities, to the extent practical.
- Directed lighting or light shielding, rather than broad lighting, will be implemented to minimize sensory disturbance on the wildlife SAR, and lighting will be focused on work sites and not surrounding areas.

Formatted: Font: Not Bold

Formatted: Font: Not Bold

- Dust generation and subsequent deposition on vegetation and in waterbodies (including potential deposition of trace metals and radionuclides) will be limited through dust suppression techniques such as road watering and traffic management.

### 3.2.5 Road and Traffic Management

- Traffic and access control measures will be implemented will include reducing traffic volume by scheduling truck convoys, using high-volume haul trucks, and restricting public access to the Project site and roads (e.g., private vehicles, snowmobiles, all-terrain vehicles, and foot traffic). It is important to note that if any individual were seeking access around the Project area to undertake Aboriginal and / or Treaty Rights, Denison staff would facilitate this, provided it were safe to do so given activities in the area.
- Appropriate road signage will be installed (e.g., speed limits) along Project roads to raise awareness and minimize the potential for wildlife SAR-vehicle collisions.
- Wildlife will have the right-of-way on Project roads, unless it is unsafe to stop (i.e., if a collision is imminent). Vehicles will not be used to encourage wildlife to move off Project roads.
- Processes will be implemented for employees and contractors to slow down and/or stop vehicles/equipment to allow animals to move away or off the road before resuming normal road speeds for the area.
- Employees and contractors will report and communicate the location and circumstances of any roadkill observed on or alongside Project roads. Large-bodied wildlife carcasses found will be reported to SK MOE and disposed of as directed to discourage avian scavengers.
- Vegetation management, such as mowing and brush cutting, will be implemented along Project roads to reduce site attractiveness for wildlife SAR and maintain appropriate sightlines for drivers to minimize wildlife-vehicle collisions.
- Alternative measures on Project roads for de-icing and winter traction (e.g., sand, gravel) or dust suppression (e.g., water) will be implemented, whenever practicable.
- Appropriately sized gaps in the roadside snowbanks during winter will be maintained to facilitate wildlife crossing and escape thereby reducing the risk of wildlife-vehicle collisions.
- New Project site and access roads will be designed to minimize sightlines for predators, whenever practicable, while still maintaining general road safety.
- Ditches and culverts along Project roads will be designed and maintained to minimize pooling of water. Roadside pools that form may attract wildlife.

Formatted: Font: Not Bold

Formatted: Font: Not Bold

### 3.2.6 Waste and Hazardous Materials Management

- A "no littering policy" for employees and contractors will be implemented within the Project Area.
- Vegetation management will be incorporated in the vicinity of waste ponds to discourage wildlife SAR use of potentially affected vegetation.
- Waste will be collected and temporarily stored in wildlife-proof containers to avoid attracting scavengers and with that increase the risk for human-wildlife interaction.
- The wildlife-proof containers will be inspected regularly for evidence of avian presence (e.g., gull species) or access to waste disposal facilities. If evidence of avian presence or access to waste disposal facilities is detected, modified systems will be implemented and/or off-site waste disposal frequencies will be increased.
- The use of hazardous materials will be limited as much as possible.

Formatted: Font: Not Bold

- Hazardous materials will be handled, stored, and disposed of appropriately and in accordance with a Waste Management Plan to avoid attracting avian scavengers (e.g., wildlife-proof containers, exclusion fencing).
- Physical deterrents (e.g., fencing) will be employed around contaminated areas (e.g., waste ponds and waste pads), the domestic landfill, or hazardous materials storage areas to discourage wildlife use.
- Appropriate hazardous materials management practices will be implemented in accordance with industry guidelines and a Waste Management Plan to minimize the risk of accidental spills or leakage.
- Appropriate spill response kits will be positioned adjacent to areas where hazardous materials are stored in accordance with the Spill Response Plan.
- A minimum 100 m distance from any waterbody will be maintained for fuel storage, refueling activities, or equipment servicing in accordance with the Spill Response Plan.
- Appropriate fuel, chemical, and materials management practices will be followed in accordance with the Spill Response Plan to minimize the risk of accidental spills or leakage of diesel fuel, other hydrocarbons, and other hazardous materials.
- Air emissions will be reduced to the extent practical through implementation of an air quality monitoring plan within the EMS.
- All vehicles and equipment will be equipped with industry-standard emission control systems; unnecessary idling of vehicles will be prohibited.
- Vehicles and equipment will be maintained in good working condition (e.g., no leaks) and furnished with industry-standard spill response kits.
- Mitigation measures to reduce the potential for dispersion of radiological contaminants of potential concern to vegetation will be implemented in accordance with the Radiation Protection Plan.
- Education on and enforcement of proper waste and hazardous materials management practices will be provided to employees and contractors.

### 3.3 Species-Specific Mitigation Measures for Wildlife Species at Risk

The following provides a summary of the species-specific mitigation measures that will be implemented during Project activities. Mitigation measures specific to the Wildlife SAR ~~that were not included or that were revised from what was described in the draft EIS are provided in bold text. These have been will be~~ added to ~~the~~ Section 9 of final EIS as applicable, with species-specific details provided here in the supporting appendix. For further information on methods and timing of SAR pre-clearance sweeps, refer to Section 4 of this appendix.

#### 3.3.1 Arthropod Species

##### 3.3.1.1 Nine-spotted lady beetle

- Mitigation measures designed for the Soil and Organic Matter / Peat (Section 9.1.5) and Vegetation and Ecosystems (Section 9.2.5) VCs are expected to mitigate adverse effects on nine-spotted lady beetle primarily related to limiting the loss and/or disruption of suitable habitat for these species. These include:
  - o The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent safely practicable resulting in reduced habitat disturbance and noise propagation.

Formatted: Heading 4,Heading 4-Denison

- Much of the proposed Project Footprint will be developed within previously disturbed areas, including roads currently used for exploration activities, thereby minimizing additional habitat disturbance.
- During Operation, progressive reclamation will be completed where possible, and the progress and success of these activities will be assessed annually.
- Herbicide use as part of vegetation management will be limited to the immediate Project Footprint and applied by licensed professional applicators, when necessary, to limit the potential for adverse effects on nine-spotted lady beetle.

#### 3.3.1.2 Transverse lady beetle

- Mitigation measures designed for the Soil and Organic Matter / Peat (Section 9.1.5) and Vegetation and Ecosystems (Section 9.2.5) VCs are expected to mitigate adverse effects on transverse lady beetle primarily related to limiting the loss and/or disruption of suitable habitat for these species. These include:
  - The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent safely practicable resulting in reduced habitat disturbance and noise propagation.
  - Much of the proposed Project Footprint will be developed within previously disturbed areas, including roads currently used for exploration activities, thereby minimizing additional habitat disturbance.
  - During Operation, progressive reclamation will be completed where possible, and the progress and success of these activities will be assessed annually.
- Herbicide use as part of vegetation management will be limited to the immediate Project Footprint and applied by licensed professional applicators, when necessary, to limit the potential for adverse effects on transverse lady beetle.

#### 3.3.1.3.1.3 Yellow-banded bumble bee

- Mitigation measures designed for the Soil and Organic Matter / Peat (Section 9.1.5) and Vegetation and Ecosystems (Section 9.2.5) VCs are expected to mitigate adverse effects on the arthropod species that are considered SAR (i.e., nine-spotted lady beetle, transverse lady beetle, and yellow-banded bumble bee.) primarily related to limiting the loss and/or disruption of suitable habitat for these species. These include:
  - The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent safely practicable resulting in reduced habitat disturbance and noise propagation.
  - Much of the proposed Project Footprint will be developed within previously disturbed areas, including roads currently used for exploration activities, thereby minimizing additional habitat disturbance.
  - During Operation, progressive reclamation will be completed where possible, and the progress and success of these activities will be assessed annually.
- Herbicide use as part of vegetation management will be limited to the immediate Project Footprint and applied by licensed professional applicators, when necessary, to limit the potential for adverse effects on arthropod species yellow-banded bumble bee.

### 3.3.2 Amphibian Species

#### 3.3.2.1 Northern leopard frog

- Mitigation measures designed for the Wetlands VC (Section 9.2.5) are expected to mitigate adverse effects on the northern leopard frog primarily related to limiting the loss and/or disruption of suitable habitat for these species. These include:
  - The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent safely practicable resulting in reduced habitat disturbance and noise propagation.
  - Much of the proposed Project Footprint will be developed within previously disturbed areas, including roads currently used for exploration activities, thereby minimizing additional habitat disturbance.
  - During Operation, progressive reclamation will be completed where possible, and the progress and success of these activities will be assessed annually.
- Pre-disturbance wildlife clearance surveys will be conducted to identify site-specific habitat features (e.g., amphibian-northern leopard frog breeding ponds) and implement the setbacks and/or timing windows (that will be defined in the Wildlife Management Plan).
- In addition to the species listed under Schedule 1 of SARA, if any features (e.g., breeding and overwintering habitat) of species included on the Saskatchewan Activity Restriction Guidelines for Sensitive Species (SK MOE 2017) are observed during the pre-clearing wildlife surveys, the applicable activity restrictions will be implemented, as appropriate, following discussion with SK MOE.
- Locations of site-specific habitat features used by northern leopard frog amphibians will be communicated to Project personnel and the requirement to limit disturbance in these areas will be implemented.
- Appropriate setback and buffer distances from wetland features where northern leopard frog amphibians are known to occur will be implemented and maintained under the direction of a wildlife QP.
- Vehicle traffic and construction activities will be restricted to the approved access routes and work areas and will not cross or enter a watercourse or wetland.

**Formatted:** Heading 4,Heading 4-Denison, Indent: Left: 0 cm, Hanging: 1.75 cm

**Formatted:** Font: Not Bold

**Formatted:** Font: Not Bold

### 3.3.3 Bat Species

#### 3.3.3.1 Little brown myotis

- Vegetation clearing activities will occur outside of little brown myotis roosting periods, when practical.
- Pre-disturbance wildlife clearance surveys will be completed to identify site-specific habitat features such as little brown myotis maternal roosting sites and hibernacula used by little brown myotis. If features are identified in the Project Footprint, appropriate setbacks and/or timing windows will be implemented (refer to Table 4-1 in final EIS Appendix 9-D which will also be defined in the Wildlife Management Plan).
- In the event a little brown myotis maternal roosting site is identified on the Project Footprint, exclusionary methods (e.g., installing a one-way bat exit) will be implemented following the summer maternity roost season. This installation would allow for little brown myotis to leave but not the ability to re-enter the roosting site.

**Formatted:** Font: Not Bold

**Formatted:** Font: Not Bold

**Formatted:** Font: Not Bold

**Formatted:** Font: Not Bold

- Locations of these site-specific habitat features used by little brown myotis will be communicated to the appropriate Project personnel and the requirement to limit disturbance in these areas will be implemented.
- Specific exclusion methods will be added as mitigation measures (Section 9.4.5 of the final EIS) to prevent access to buildings and other infrastructure.

Formatted: Bullet 1 - Denison

### **3.3.3.3.2 Northern myotis**

- Vegetation clearing activities will occur outside of northern myotis roosting periods, when practical.
- Pre-disturbance wildlife clearance surveys will be completed to identify site-specific habitat features such as northern myotis maternal roosting sites and hibernacula used by northern myotisbat species. If features are identified in the Project Footprint, appropriate setbacks and/or timing windows will be implemented (refer to Table 4-1 in final EIS Appendix 9-D which will also be defined in the Wildlife Management Plan).~~If features are identified in the Project Footprint, appropriate setbacks and/or timing windows will be implemented in accordance with the SARGSS (SK MOE 2017) (that will also be defined in the Wildlife Management Plan).~~
- In addition to the species listed under Schedule 1 of SARA, if any features (e.g., roost/foraging site) of species included on the Saskatchewan Activity Restriction Guidelines for Sensitive Species (SK MOE 2017) are observed during the pre-clearing wildlife surveys, the applicable activity restrictions will be implemented, as appropriate, following discussion with SK MOE.
- In the event a northern myotis maternal roosting site is identified on the Project Footprint, exclusionary methods (e.g., installing a one-way bat exit) will be implemented following the summer maternity roost season. This installation would allow for northern myotis bats to leave but not the ability to re-enter the roosting site.
- Locations of these site-specific habitat features used by northern myotisbats will be communicated to the appropriate Project personnel and the requirement to limit disturbance in these areas will be implemented.
- Specific exclusion methods will be added as mitigation measures (Section 9.4.5 of the final EIS) to prevent access to buildings and other infrastructure.

### **3.3.4 Avian Species**

#### **3.3.4.1 Bank Swallow**

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the bank swallow nesting season, when practical. The breeding and nesting season for bank swallow in Saskatchewan typically spans a period from May 15 to July 31.
- In the event Project activities such as vegetation clearing and/or soil disturbance are required during the bank swallow breeding and nesting season, pre-disturbance wildlife clearance surveys will be conducted by a QP at that location within the Project Area before activities commence to identify the presence of bank swallow nests.
- Active and/or suspected bank swallow nests identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with adopted regulatory guidelines (e.g., Manitoba Conservation [2021] as there is currently no activity restriction guidelines for bank swallow in Saskatchewan) in accordance with the level of

Formatted: Font: Not Bold

the disturbance until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations).

- Locations of nesting sites used by bank swallows will be communicated to appropriate Project personnel and the requirement to limit disturbance in these areas will be implemented.

Formatted: Bullet 1 - Denison

Formatted

#### 3.3.4.2 Barn Swallow

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the barn swallow nesting season, when practical. The breeding and nesting season for barn swallow in Saskatchewan typically spans a period from May 15 to September 30.
- In the event Project activities such as vegetation clearing and/or soil disturbance are required during the barn swallow breeding and nesting season, pre-disturbance wildlife clearance surveys will be conducted by a QP at that location within the Project Area before activities commence to identify the presence of barn swallow nests.
- Active and/or suspected barn swallow nests identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with adopted regulatory guidelines (e.g., Manitoba Conservation [2021] as there is currently no activity restriction guidelines for barn swallow in Saskatchewan) in accordance with the level of the disturbance until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations).
- Locations of nesting sites used by barn swallows will be communicated to appropriate Project personnel and the requirement to limit disturbance in these areas will be implemented.

Formatted: Font: Not Bold

#### 3.3.4.3 Common Nighthawk

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the common nighthawk nesting season, when practical. The breeding and nesting season for common nighthawk in Saskatchewan typically spans a period from May 1 to August 31.
- In the event Project activities such as vegetation clearing and/or soil disturbance are required during the common nighthawk breeding and nesting season, pre-disturbance wildlife clearance surveys will be conducted by a QP at that location within the Project Area before activities commence to identify the presence of common nighthawk nests.
- Active and/or suspected common nighthawk breeding and roosting locations identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with regulatory guidelines (e.g., the 2017 SARGSS [SK MOE 2017]) in accordance with the level of the disturbance until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations).

Formatted: Font: Not Bold

#### 3.3.4.4 Horned Grebe

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the horned grebe nesting season, when practical. The breeding and

nesting season for horned grebe in Saskatchewan typically spans a period from May 1 to September 15.

- In the event Project activities such as vegetation clearing and/or soil disturbance are required during the horned grebe breeding and nesting season, pre-disturbance wildlife clearance surveys will be conducted by a QP at that location within the Project Area before activities commence to identify the presence of horned grebe nests.
- Active and/or suspected horned grebe nests identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with regulatory guidelines (e.g., the 2017 SARGSS [SK MOE 2017]) for other grebe species (as there is currently no activity restriction guidelines for horned grebe in Saskatchewan) in accordance with the level of the disturbance until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations).
- Locations of nesting sites used by horned grebe will be communicated to appropriate Project personnel and the requirement to limit disturbance in these areas will be implemented.

Formatted: Bullet 1 - Denison

Formatted

#### 3.3.4.5 Olive-sided Flycatcher

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the olive-sided flycatcher nesting season, when practical. The breeding and nesting season for olive-sided flycatcher in Saskatchewan typically spans a period from May 1 to August 31.
- In the event Project activities such as vegetation clearing and/or soil disturbance are required during the olive-sided flycatcher breeding and nesting season, pre-disturbance wildlife clearance surveys will be conducted by a QP at that location within the Project Area before activities commence to identify the presence of olive-sided flycatcher nests.
- Active and/or suspected olive-sided flycatcher nests identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with regulatory guidelines (e.g., the 2017 SARGSS [SK MOE 2017]) in accordance with the level of the disturbance until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations).

Formatted: Font: Not Bold

Formatted: Font: Not Bold

#### 3.3.4.6 Rusty Blackbird

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the rusty blackbird nesting season, when practical. The breeding and nesting season for rusty blackbird in Saskatchewan typically spans a period from May 1 to July 31.
- In the event Project activities such as vegetation clearing and/or soil disturbance are required during the rusty blackbird breeding and nesting season, pre-disturbance wildlife clearance surveys will be conducted by a QP at that location within the Project Area before activities commence to identify the presence of rusty blackbird nests.
- Active and/or suspected rusty blackbird nests identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with regulatory guidelines (e.g., the 2017 SARGSS [SK MOE 2017]) in accordance with the level of the disturbance until the young have successfully fledged, the nest is confirmed as no longer active

Formatted: Font: Not Bold

Formatted: Font: Not Bold

(e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations).

#### 3.3.4.7 Short-eared Owl

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the short-eared owl nesting season, when practical. The breeding and nesting season for short-eared owl in Saskatchewan typically spans a period from March 25 to August 1.
- In the event Project activities such as vegetation clearing and/or soil disturbance are required during the short-eared owl breeding and nesting season, pre-disturbance wildlife clearance surveys will be conducted by a QP at that location within the Project Area before activities commence to identify the presence of short-eared owl nests.
- Active and/or suspected short-eared owl nests identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with regulatory guidelines (e.g., the 2017 SARGSS [SK MOE 2017]) in accordance with the level of the disturbance until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations).

#### 3.3.4.8 Yellow Rail

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the yellow rail nesting season, when practical. The breeding and nesting season for yellow rail in Saskatchewan typically spans a period from May 1 to July 15.
- In the event Project activities such as vegetation clearing and/or soil disturbance are required during the yellow rail breeding and nesting season, pre-disturbance wildlife clearance surveys will be conducted by a QP at that location within the Project Area before activities commence to identify the presence of yellow rail nests.
- Active and/or suspected yellow rail nests identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with regulatory guidelines (e.g., the 2017 SARGSS [SK MOE 2017]) in accordance with the level of the disturbance until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations).
- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the nesting season, when practical. The breeding and nesting season for most avian species in Saskatchewan typically spans a period from March 15 to August 31; however, the dates differ for certain species.
- In the event Project activities such as vegetation clearing and/or soil disturbance are required during the breeding and nesting season, pre-disturbance wildlife clearance surveys will be conducted by a QP at that location within the Project Area before activities commence to identify the presence of avian SAR and/or their nests.
- Active and/or suspected breeding and roosting locations identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with regulatory guidelines (e.g., the 2017 SARGSS [SK MOE 2017]) for other grebe species (as there is currently no activity restriction guidelines for horned grebe in

Formatted: Font: Not Bold

Formatted: Font: Not Bold

Formatted: Font: Not Bold

Formatted: Font: Not Bold

Saskatchewan) in accordance with the level of the disturbance and species until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations).

- In addition to the species listed under Schedule 1 of SARA, if any features (e.g., nests) of species included on the Saskatchewan Activity Restriction Guidelines for Sensitive Species (SK MOE 2017) are observed during the pre-clearing wildlife surveys, the applicable activity restrictions will be implemented, as appropriate, following discussion with SK MOE.
- Locations of nesting sites used by bank swallows, barn swallows, and horned grebe will be communicated to appropriate Project personnel and the requirement to limit disturbance in these areas will be implemented.
- Deterrents designed to discourage or prevent barn swallows from using buildings and other Project infrastructure have been described in Section 3.2.4 of the EIS.
- Buildings and other Project infrastructure will be designed and maintained to exclude birds (e.g., barn swallows) and bats as much as practical. This would include installing solid barriers (e.g., corner slope panels, wooden panels) or flexible barriers (e.g., netting, tarps or geotextiles) under roof eaves or other exterior surfaces.

## 4 Pre-clearance SAR Survey Methods

[The methods and timing of proposed SAR pre-clearance sweep are provided in Table 4-1.](#)

Table 4-1 Wildlife Species at Risk Pre-clearance Sweep Methods and Timing

Species of Concern	Baseline Survey Results	Assessed in the EIS	Important Habitat and Needs	Survey Target Areas	Survey Technique	Timing	Action if Species Detected	Information Source
Northern Leopard Frog	Not observed.	Appendix 9-D	<a href="#">From winter sites, adult frogs travel up to 1.6 km to breed.</a>	Wetlands/ water/ riparian / wet/ moist/ scrublands/ bogs/ fens.	<a href="#">Visual searches for egg masses or frogs.</a>	<a href="#">Snow/ice-free early spring and spring season.</a>	<a href="#">Pond setback; 10m (low); 200m (Mod) and 500m (High);</a>	<a href="#">MOE (2017)</a>
			<a href="#">They breed in the shallow, warm waters of a variety of wetlands including marshes, springs, flooded ditches, dugouts, borrow pits, beaver ponds, margins of lakes, and slow-moving waters of streams and rivers.</a>		<a href="#">Auditory call surveys.</a>	<a href="#">April 20 to June 10.</a>		
			<a href="#">After breeding, adults and sub-adults may disperse up to 8 km from breeding ponds.</a>					
			<a href="#">Northern Leopard Frogs usually do not utilize areas that are heavily wooded</a>		<a href="#">Visual searches for egg masses or frogs.</a>	<a href="#">Snow/ice-free early spring and spring season.</a>		
			<a href="#">They forage in the summer in riparian or upland habitats. These areas are moist habitats including meadows, pastures, scrublands, riparian corridors, and drainage or irrigation ditches.</a>		<a href="#">Visual searches for egg masses or frogs.</a>	<a href="#">Snow/ice-free early spring and spring season.</a>		
<a href="#">Little Brown Myotis and Northern Bat</a>	<a href="#">34 ultrasonic detections of little brown/northern myotis.</a>	<a href="#">Appendix 9-D</a>	<a href="#">The presence of large snags, tree cavities, is an important attribute in old growth forest stands that provides maternity roosts and day roosts for northern myotis and little brown bats. Building are also used.</a>	<a href="#">Treed areas with the largest diameter and/or older trees. Focus on older forest, or areas with large snags in younger forest within the project footprint (majority is regenerating forest 1-5m).</a>	<a href="#">Daytime visual search of trees and potential roost sites. Systematic meandering search of areas to be cleared during active bat season. Focus on searching for roost features (snags, cracks, stumps, cavities, bark peeling) and bat sign (e.g., guano).</a>	<a href="#">May to Sept</a>	<a href="#">Should a roosting bat be discovered the area will be afforded protection from clearing for 24 hours and re-surveyed. The area will only be cleared if no bats are discovered. A 100 m buffer will be given to nursery roots and 50 m to daily roosting bats. If many roosting bats are recorded compensation will be considered (e.g., bat houses).</a>	<a href="#">COSEWIC (2013a); Resources Information Standards Committee (RISC) (2022)</a>

Species of Concern	Baseline Survey Results	Assessed in the EIS	Important Habitat and Needs	Survey Target Areas	Survey Technique	Timing	Action if Species Detected	Information Source
			Foraging habitat in proximity to roosting sites is also an important factor in roost selection.	Treed areas in proximity to clearings, wetlands and open water.		Year Round	Roost/Foraging site; 100m(low); 500m (Mod) and 500m (High);	MOE (2017)
Wolverine	Not observed.	Section 9.3	A wide variety of forested and vegetation associations are used by wolverine. Habitats must have an adequate year-round supply of food, mainly consisting of smaller prey such as rodents and Snowshoe Hares, and the carcasses of large ungulates, like Moose, Caribou, and Muskox.	All areas of project activity.	Winter den searches.	Snow cover months.	Setback of 250m when occupied and 100m when unoccupied.	COSEWIC (2014); Environmental Protection and Management Guideline (2024)
			Females den under snow-covered rocks, logs or within snow tunnels. Wolverines reproduce in areas where snow cover persists at least into April.					
Woodland Caribou	Observed.	Section 9.3	Woodland caribou may occupy all potential project areas but prefer forests greater than 40 years of age.	All areas of project activity.	Visual search to ensure no caribou are in the area. Ongoing vigilance.	Year Round	If caribou are in the area cease operations until they are clear of the area.	SME (2021)
Rusty Blackbird	Not observed.	Section 9.4	Rusty blackbird primarily nests in small conifers, predominantly spruce. In Canada, nests have also been found in Balsam Fir, Eastern White Cedar, Paper Birch, Balsam Poplar, Red Maple, Pin Cherry, emergent sedges, cattails, and on the ground on a beaver dam	All habitat with spruce, white birch and balsam poplar. Very limited suitable (spruce) habitat within project footprint.	Visual search for nests.	MBCA window	A 75 m buffer around coniferous bogs, fens and other wetlands suitable for Rusty blackbirds (Odsen and Pyper 2019).	Environment Canada. (2015); Odsen and Pyper (2019); Wildlife Division (2020)
			We only have spruce, birch and poplar at Wheeler.			May 1 to July 31	Nest setback of 0-50m (low activity); 150m (Mod activity) and 300m (High activity);	
Yellow Rail	Not observed.	Section 9.4	Yellow rails inhabit shallow wetlands and other wet areas with grass-like vegetation.	Using available mapping conduct daytime Ecosite verification and stratify surveys in appropriate habitat only.	Mid May to mid to late June. Triplicate nocturnal (23:00-03:00) call-playback surveys spaced at least 4	-	-	Environment Canada (2012); SME (2014)  Detection surveys per Saskatchewan Species Detection Survey Protocol (SDSP) <a href="https://publications.saskatchewan.ca/#/products/79508">https://publications.saskatchewan.ca/#/products/79508</a>
			They breed in wetlands such as damp hay fields or meadows, floodplains, bogs, upper levels of estuaries, salt marshes

Formatted: Font color: Background 1

Species of Concern	Baseline Survey Results	Assessed in the EIS	Important Habitat and Needs	Survey Target Areas	Survey Technique	Timing	Action if Species Detected	Information Source
			These wetlands are generally dominated by short, fine-stemmed herbaceous vegetation, especially sedges (Carex spp.), as well as other graminoid vegetation of the families Cyperaceae, Poaceae, and Juncaceae. Vegetation structure (e.g. short, grass-like, and dense) is likely more important than its taxon	Based on available mapping, no suitable habitat within project footprint.	days apart. Or use Autonomous Recording Units throughout the breeding season.			
			Breeding habitats may have up to 50 cm of standing water, but typically nesting sites are less than 15 cm deep			May 1 to July 15	Nest site setback; 100m(low); 150m (Mod) and 350m (High);	MOE (2017)
Bank Swallow	Not observed.	Appendix 9-D	The Bank Swallow readily breeds in a wide variety of low-elevation (< 900 m), natural and anthropogenic habitats, including: lake and ocean bluffs; stream and river banks; sand and gravel pits; roadcuts; and piles of sand, topsoil, sawdust, coal ash, and other materials.	Survey key habitat features identified as important.	Visual survey during timing window.	May 15 to July 31	Nesting Colony Setback; 50m (low); 150m (Mod) and 300m (High);	Manitoba Conservation (2021)
			Nest burrows are nearly always in a vertical or near-vertical bank (range: 76-105° slope;			-	-	COSEWIC (2013b)
			In some cases, Bank Swallows have nested in drain pipes and in structures designed and built specifically for nesting Bank Swallows					
Barn Swallow	Four visual/auditory detections.	Appendix 9-D	Nest on horizontal and vertical structures that include natural sites, such as cliffs and caves, as well as human-made structures, such as barns, bridges, and culverts . The nesting substrate must be rough, or have a ledge or projecting objects, such as bolts or light fixtures, to provide additional structural support to the nest.	Open areas in proximity to water. All buildings and man-made structures.	Visual.	May 15 to Sept 30	Nest site setback; 50m (low); 100m (Mod) and 100m (High);	Manitoba Conservation (2021)
			Nesting sites must provide access to open areas with an abundant supply of aerial insects to feed on; features such as wetlands, waterbodies, watercourses, meadows, grazed grassland, and farmland are preferred . Proximity to a waterbody or moist area with a supply of wet mud is needed to facilitate nest construction.			-	-	COSEWIC (2021a)

Formatted: Font color: Background 1

Species of Concern	Baseline Survey Results	Assessed in the EIS	Important Habitat and Needs	Survey Target Areas	Survey Technique <sup>1</sup>	Timing	Action if Species Detected	Information Source
Common Nighthawk	Two nests, five visuals and 76 auditory/visual detections.	Section 9.4	Nests are typically in open sites with dry, well-drained substrates that will not overheat and that have shade nearby for young to shelter from the sun and predators. Nest sites include forest clearings, bare patches in grassland, gravel pits, outcrops, road or rail sides, and, rarely, fenceposts.	All upland habitat.	Call-playback.	May 1 to Aug 31	Nest site setback; 0-50m (low); 150m (Mod) and 300m (High);	MOE (2017)  Detection surveys per Saskatchewan Species Detection Survey Protocol (SDSP) <a href="https://publications.saskatchewan.ca/api/v1/products/79502/formats/117104/download">https://publications.saskatchewan.ca/api/v1/products/79502/formats/117104/download</a>
Horned Grebe	One observation.	Appendix 9-D	More than 90% of the Horned Grebes in North America breed in ponds and lakes in western and northern Canada.	Water bodies within the project area.	Visual searches.	May 1 to Sept 15	Nest site setback; 100m (low); 200m (Mod) and 400m (High);	Manitoba Conservation (2021)
						-	-	COSEWIC (2009b)
						May 1 to Aug 31	Nest setback; 100m (low); 300m (Mod) and 500m (High);	MOE (2017)
Olive-sided Flycatcher	Fourteen observations.	Section 9.4	Olive-sided Flycatcher has been widely observed in open coniferous or mixed coniferous forests, often located near water or wetlands with the presence of tall snags or trees	All conifer and/treed upland areas.	Call-playback.	May 1 to Aug 31	Nest setback; 100m (low); 300m (Mod) and 500m (High);	MOE (2017)
			Data gathered from points across Canada indicate that mature conifer stands within patchy landscapes influenced by natural disturbance (e.g., recent burns) support the highest densities			-	-	Environment Canada (2016)
			Olive-sided Flycatcher prefers post-burn areas or wetlands that create open habitats for the species to forage			-	-	Detection surveys per Saskatchewan Species Detection Survey Protocol (SDSP)
Short-eared Owl	Not observed.	Section 9.4	Nesting generally occurs in large open areas	Open upland and lowland areas with no trees and some shrub cover.	Call-playback.	March 25 to Aug 1	100m (low); 300m (Mod) and 500m (High);	MOE (2017)
			Requires a minimum area of about 50-100 ha, consistent with the mean territory size of 82 ha reported in Manitoba.			-	-	COSEWIC (2021b)
			In the north, nests are primarily in tundra (Sinclair et al. 2003), and sometimes beside a small shrub that provides cover			-	-	Detection surveys per Saskatchewan Species Detection Survey Protocol (SDSP) <a href="https://publications.saskatchewan.ca/api/v1/products/79506/formats/117101/download">https://publications.saskatchewan.ca/api/v1/products/79506/formats/117101/download</a>

<sup>1</sup> Surveys will be completed by qualified professional biologists; in their capacity as professional biologists, they will refer to available guidance such as the Saskatchewan species detection survey protocols to develop details of the surveys (e.g., selecting the appropriate time of day for the survey).

## 45 Residual and Cumulative Effects Summary

The approach to assessing residual Project effects on wildlife VCs followed the methodology outlined in Section 5.8 of the EIS, which included a habitat-based approach. For each VC and associated KI, each residual effect was assessed in the context of the Project activities that will occur within each Project phase. Each residual effect was then characterized based on the combined predicted residual effect for all phases. See Sections 9.3.6 and 9.4.6 of the EIS for specific details regarding the residual effects assessment for wildlife VCs (i.e., residual effect characterization and significance determination). A summary of the environmental assessment considerations and determination for predicted residual effects for Wildlife SAR is provided in Table 5-1. ~~Mitigation measures specific to the Wildlife SAR that were not included or that were revised from what was described in the draft EIS are provided in bold text. These will be added to the final EIS.~~

The cumulative effects assessment (CEA) followed standard methodology as per provincial (e.g., Guidelines for an Environmental Assessment under the [Saskatchewan] *Environmental Assessment Act* 1980) and federal (e.g., Assessing Cumulative Environmental Effects under the *Canadian Environmental Assessment Act* 2012) guidance, and is discussed in detail in Section 5.9 of the EIS. Similar to the residual effects assessment, the CEA included a habitat-based approach. See Sections 9.3.7 and 9.4.7 of the EIS for specific details regarding the CEA for wildlife VCs. A summary of the significance determination of the cumulative effects on Wildlife SAR is provided in Table 5-2.

Table 5-14.1 Summary of the Environmental Assessment Considerations and Determination for Predicted Residual Effects for Wildlife Species At Risk

Component	Wildlife SAR	Measurable Parameters	Project Activities Resulting in Primary Interactions	Project Phase	Species-Specific Mitigation Measures <sup>1</sup>	Predicted Residual Effect	Significance
Terrestrial Environment	Nine-spotted lady beetle <del>Transverse lady beetle</del> <del>Yellow-banded bumble-bee</del>	Amount of habitat that is altered or lost relative to its availability in the Terrestrial Regional Study Area (RSA).	<ul style="list-style-type: none"><li>• Development of access roads and air strip.</li><li>• Site preparation and earthworks; clearing, levelling, and grading of the Project Area.</li><li>• Waste management (composting, domestic and industrial landfill operation, recycling).</li><li>• Water management (including treatment).</li><li>• Surface water withdrawal.</li><li>• On-site and off-site operation of vehicles and transport of materials.</li><li>• Air transportation for workers.</li></ul>	Construction	<ul style="list-style-type: none"><li>• The proposed mitigation measures outlined in the EIS, particularly those designed for the Valued Components (VCs) Soil and Organic Matter / Peat (Section 9.1.5) and Vegetation and Ecosystems (Section 9.2.5), adequately and appropriately address potential for adverse effects on <del>these species</del><b>nine-spotted lady beetle</b>, primarily related to limiting the loss and/or disruption of suitable habitat. These include the following:<ul style="list-style-type: none"><li>- The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent safely practicable resulting in reduced habitat disturbance and noise propagation.</li><li>- Much of the proposed Project Footprint will be developed within previously disturbed areas, including</li></ul></li></ul>	Alteration and/or loss of habitat: predicted to be low magnitude, local geographical extent, long-term duration, frequent, and fully reversible.	Not Significant: the predicted residual effect of alteration and/or loss of habitat is not expected to alter the integrity of the habitat for <del>the nine-spotted lady beetle</del> <b>arthropod SAR</b> within the Terrestrial RSA to the point where it is not sustainable or available to contribute to ecological functions.
			<ul style="list-style-type: none"><li>• Water withdrawal from groundwater or surface water body.</li><li>• Management of surface water (including seepage and site runoff).</li><li>• Water release to groundwater and/or surface water body.</li><li>• On-site and off-site operation of vehicles and transport of materials.</li><li>• Air transportation for workers.</li></ul>	Operation			

<sup>1</sup>Mitigation measures specific to the Wildlife SAR that were not included or that were revised from what was described in the draft EIS are provided in bold text.

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, July 4, 2024)	IR (ROUND 4 Sept. 6, 2024)	Denison Response (ROUND 4, September 27, 2024)
IR-174	-	<p><b>Context and Rationale:</b> The Proponent conducted acoustic surveys for bats and confirmed presence of two Species at Risk Act (SARA) schedule 1 listed bat species in the Project area, little brown myotis (Myotis lucifugus) and northern myotis (Myotis septentrionalis). However, the Proponent did not do an effects assessment of either of these bat species.</p> <p>Although bats are present in the study area, no work was done to identify hibernaculum or maternal roosting sites. All species at risk that are expected to be present in the Project area should be assessed and species-specific mitigations detailed.</p>	<p>1. Conduct an effects assessment for little brown myotis and northern myotis, including the likelihood that tree clearing during the bat roosting period, is likely to ‘kill’, ‘harm’, or ‘harass’ Little Brown Myotis and Northern Myotis and its ability to carry out its life processes.</p> <p>2. Describe and map locations of suitable myotis hibernacula and/or maternal roost habitat within the Local Study Area and Regional Study Area and explain how these habitats may be affected by Project activities.</p> <p>3. Describe what mitigation measures will be taken to avoid the breeding period for bats.</p> <p>4. Describe any pre-construction/pre- clearing surveys will be conducted to identify any hibernaculum and maternal roosting sites. Describe how monitoring will support adaptive management.</p>	<p>As Key Indicators of Valued Components, the EIS includes terrestrial wildlife and avian species that may occur in the Project study areas and are listed on Schedule 1 of the federal Species at Risk Act. Project effects on these species and their habitats are described and assessed, and mitigation measures are included to avoid or reduce the potential for adverse effects on these species and their habitats. The Project effects and associated mitigation measures described in the draft EIS are broadly applicable to SAR species that occupy the same ecological niches.</p> <p>In response to a variety of IRs, including this IR, further information has been developed that is specific to SAR and included as Attachment IR-131. This includes a listing of all SAR species potentially occurring in the Project study areas, with links to applicable and appropriate mitigation measures described in the EIS. It is proposed the content of Attachment IR-131 will be added as a new appendix (Appendix 9-D) to Section 9 of the final EIS. The information provided in the SAR appendix includes a summary of the life history requirements, the expected Project effects, proposed mitigation measures, and anticipated residual effects on these listed species. This new EIS appendix provides information on little brown myotis and northern myotis. We note Denison’s commitment to pre-construction surveys to identify potential for maternity and nursery roosting habitat. Refer to response to IR-134 for the timing of clearing activities outside of roosting periods. Results from pre-construction surveys and continuous monitoring (described in Section 9.3.8) will be used in the adaptive management process to update Project design and additional mitigation measures, if required.</p>	<p>This response has not been accepted.</p> <p>Items 1., 3. And 4. of IR-174 are accepted, however, item 2. Of IR-174, which asked for mapping of suitable myotis habitat, was not addressed.</p> <p>Mapping of suitable habitat or results from baseline studies is required to understand Project impacts to Species At Risk (SAR) bat species. This may include providing mapping of bat acoustic results, including locations along with frequency of detections.</p> <p>See also IR-134 and follow-up 134-R1.</p>	<p>Acoustic bat surveys were completed between July 22 and 23, 2019 with 61 survey points sampled across five ecosite types. The location of the survey points, species detected, and frequency of detections are included in Figure 2-9 of Appendix 9-F of the revised draft EIS.</p> <p>The EA used a habitat-based approach to predict the effects of the Project on bat species. Further, in the event that site clearing is necessary, pre-clearance wildlife sweeps will be completed and appropriate mitigation will be developed and implemented.</p> <p>The pre-construction and pre-clearing surveys will consist of wildlife sweeps conducted by qualified biologists within 7 days prior to any clearing activity at a specific location, and a 100 m buffer, within the Project Footprint. The wildlife sweeps will not be species-specific surveys focused on species at risk but will to be based on timing of Project related activities (i.e., will be completed in advance of site clearing activities). These sweeps are intended to identify sensitive wildlife features (including hibernacula or potential roosting sites for myotis species) that would require specific mitigation measures to avoid or minimize adverse effects on identified features and are not species-specific. The methods associated with these pre-construction and pre-clearing sweeps will be tailored to species at risk (including myotis species) that may potentially be using habitats at certain times of the year. Depending on the results of these surveys, appropriate mitigation measures will be developed and implemented. This is a risk-based approach with the intent of reducing the potential of important wildlife features being adversely affected during vegetation or land disturbance activities. The wildlife sweeps would be conducted within 7 days prior to disturbance activities, year-round, so that sensitive features can be identified, and appropriate mitigation measures (e.g., avoidance, timing delay) can be developed and implemented, as appropriate.</p>	<p><b>Note to Denison:</b> There is additional text being drafted related to this topic, but it is still under review and may provide clarity on the outstanding request.</p> <p>Items one, three, and four have been accepted, but the response to item 2, regarding describing and mapping of locations of suitable myotis hibernacula and/or maternal roost habitat within the Local Study Area and Regional Study Area and an explanation of how these habitats may be affected by Project activities, is outstanding.</p> <p>In responding to item two, the Proponent has provided a map of species detected and frequency of detection in the local study area over two days on July 22 and 23, 2019. ECCC notes that analysis is lacking for the regional study area, despite a few autonomous recording units (ARUs) that were placed outside the LSA.</p> <p>Data from two consecutive days in the same month is not an accepted method to document baseline occurrences associated with suitable habitat. The legend for Figure 2-9 is not clear in that frequency of detection is mapped based on two criteria: little brown myotis and little brown/northern myotis.</p> <p>The Proponent should use a scientifically defensible method to document baseline occurrences associated with suitable habitat. The Proponent should clarify the legend and explain the values found within it, including if the turquoise dot represent occurrence of both little brown and northern myotis. Baseline data for bat SAR must be adequate to capture within and between year variability and to allow for statistically robust comparison to assess potential impacts on SAR over the lifecycle of the project. In this regard, Denison is expected to provide additional baseline data for bat SAR. If Denison choses to rely on literature data, a justification of applicability to the project is required. Nevertheless, Denison is expected to at a minimum commit to additional baseline monitoring prior to any disturbance, and to provide a description of the monitoring methods for review. These baseline surveys must be focused on suitable habitat for bat SAR that is to be identified through the requested mapping.</p> <p>To close this IR, Denison must:</p> <ol style="list-style-type: none"><li>1. Clarify the legend of Figure 2-9 with respect to frequency of detection</li><li>2. Provide suitable bat SAR habitat information in the form of a map</li><li>3. Provide additional baseline data for bat SAR based on literature sources and justify applicability to the project</li><li>4. Provide a description of proposed methods for bat SAR field monitoring for review</li></ol>	<p>See IR-174 Round 3 Attachment below for supporting maps associated with responses to parts 2 and 3; the round 3 attachment is located at the end of this file.</p> <p>1. The legend of revised draft EIS Appendix 9-F, Figure 2-9 (with respect to frequency of detection) shows the total number of passes and/or buzzes detected. We note this was available in Appendix 9-B Terrestrial Baseline. For additional reference it is also noted that the acoustic survey method in Appendix 9-B did not reliably allow for differentiation between little brown myotis and northern myotis, hence the two criteria presented on the map: i) little brown myotis and ii) little brown/northern myotis. These clarifications are included in the figures below and are included in Appendix 9-F of the final EIS.</p> <p>2. Refer to IR-174 Round 3 Attachment below for ECCC’s requested map edits, that builds on the information presented in the map provided in revised draft EIS Appendix 9-F Figure 2-9 provided with the Round 2 response. Specifically, please see Figure IR-174 Round 3-1 and Figure IR-174 Round 3-2. These maps present the same information from Appendix 9-F Figure 2-9 only at a different spatial scale and with the Project Area unshaded to facilitate review.</p> <p>3. As noted in Appendix 9-D, habitat for the little brown myotis is composed of (1) overwintering hibernacula that are sufficiently cool and humid and (2) summering areas that provide foraging areas and suitable locations for roosting and maternity colonies (COSEWIC 2013). Hibernacula and maternity sites are reported as being the main limiting habitat features for this species (COSEWIC 2013), and this, as described below, is consistent with conditions at the Project site and surrounding area.</p> <p>Hibernacula occur in parts of caves, mines (openings to surface for ramps and raises for example), and buildings that have stable and specific temperature (-4 to 13°C) and humidity (&gt;80%) conditions (COSEWIC 2013). Based on existing environment information presented in the EIS including the terrain and vegetation and ecosystem existing environment sections, there are no hibernacula anticipated in the Project Area (i.e., caves, mines, buildings with stable and specific temperatures per COSEWIC 2013). Terrain is low relief due to flat-lying sandstone and almost continuous cover of sandy glacial deposits (i.e., surface is predominately sand textured and there are no rocky outcrops or bedrock at surface for cave habitats); there are no man-made structures (e.g., mine openings or buildings) in the Project Area. As noted in the EIS, the terrain and vegetation communities are fairly uniform throughout the study areas and the habitat considerations in the</p>	<p>Following the supplementary information provided by Denison on July 5<sup>th</sup>, CNSC staff determined that it is unclear from the proponent’s response whether Denison will perform both pre-disturbance surveys <b>and</b> additional baseline surveys for bat SAR.</p> <p>In order to resolve this IR, Denison are expected to:</p> <ol style="list-style-type: none"><li>1. Revise Figure 2-9 to re-label frequency as number of detections by time. Clarify regarding the turquoise dots if species data is uncertain in all cases or were detections for some identifiable?</li><li>2. Revise Figure IR-174 Round 3-1 and Figure IR-174 Round 3-2 to depict habitat potential for different life stages of the species for different bats.</li><li>3. Provide the proposed methods for the additional bat SAR baseline surveys including a description of the statistical approaches to be used. The methods must demonstrate how the baseline data will be of sufficient sample size and duration to obtain a basic understanding of within-year and between-year variation.</li><li>4. Provide a commitment to conduct additional bat SAR baseline surveys in their commitments register.</li></ol>	<p>1. The frequency of detections was on a 5 minute interval. This has been clarified in Figure 2-9 of Appendix 9-F. We can confirm the turquoise dots represent passes or buzzes that were uncertain (unable to distinguish echolocation call characteristics between bat species) in all cases.</p> <p>2. See <b>Attachment IR-174 (Round 4)</b> below for the response to this IR along with supporting maps.</p> <p>3. Methods for future pre-construction baseline bat surveys will build on the 2019 baseline (refer to EIS Appendix 9-B) and methods from the 2019 baseline are provided below along with information on how comparisons within year and between years will be completed.</p> <p><i>Methods</i></p> <p>Surveys will be commenced one half hour after sunset and ended one half hour before sunrise. Survey stations will be established 500 m apart along linear features where safe night travel was possible.</p> <p>Surveys will only be completed during appropriate weather conditions, with weather attributes (temperature, sky condition and wind (Beaufort scale)) recorded throughout the survey.</p> <p>Each survey site consists of a five-minute listening period using a Wildlife Acoustics Echo Meter Touch 2 Pro. The detector will be held with the microphone at a 45 degree angle and slowly rotated 360 degrees for the duration of the sampling period. If a bat is detected the detector is held stationary for 15 seconds to avoid duplicate counts.</p> <p>Total detector hours will be calculated for the Project area and by ecosite/vegetation cover type. Ecosite/vegetation cover type for each survey point is established by utilizing the dominate ecosite/vegetation cover type within a 50 m radius of the survey point.</p> <p><i>Acoustic Bat Call Analysis</i></p> <p>Data will be analyzed using Wildlife Acoustics Kaleidoscope software. Echolocation call characteristics will be used to identify bat species. Call characteristics used to establish species included:</p> <ul style="list-style-type: none"><li>• minimum frequency</li><li>• maximum frequency</li><li>• call duration</li><li>• call slope</li><li>• call shape</li></ul> <p>Call characteristics will be compared to reference calls in literature and call libraries (WDNR 2016, WNDD 2016, Keinath 2011, Adams 2003). In addition, reference calls within Omnia’s call library will be used where possible.</p> <p>For future monitoring of bat species Denison will continue to inventory bat presence at given sites and this data will be analyzed to characterize:</p> <ol style="list-style-type: none"><li>1. Presence (occupancy)</li><li>2. Relative abundance</li><li>3. Change metrics to be analyzed include:<ol style="list-style-type: none"><li>a. Annual and total change at specific site</li><li>b. Annual and total change across all sites</li></ol></li></ol> <p>The analysis will be done using mean and 95% credible interval bars and will include covariates such as time of year</p>

Original IR#	Follow-Up IR #	Context and Rationale	IR (ROUND 1, March 2023)	Denison Response (ROUND 1, August 2023)	IR (ROUND 2, December 2023)	Denison Response (ROUND 2, Feb. 2024)	IR (ROUND 3, May 31, 2024)	Denison Response (ROUND 3, July 4, 2024)	IR (ROUND 4 Sept. 6, 2024)	Denison Response (ROUND 4, September 27, 2024)
							<p>5. Commit to an EA <u>commitment</u> to collect additional bat SAR field baseline data prior to disturbance</p>	<p>Project Area are considered representative of the landscape in the wildlife LSA and RSA.</p> <p>Maternity sites can occur in large-diameter trees, rock crevices, buildings, and bat houses that offer warm and relatively stable microclimate conditions that allow females to avoid going into torpor so they can focus on caring for their young (COSEWIC 2013a, Slough and Jung 2020). As highlighted above, since there are no rock crevices, buildings, or bat houses in the Project Area, a consideration for maternal roost potential was focused on the areas where larger diameter trees may be present.</p> <p>Existing ecosite information was reviewed and ecosites with higher potential for maternity roosts (i.e., larger diameter trees) were selected. The ecosites with the potential for larger diameter trees are shown in Figure 2-10 below, and include ecosites RF1 (regenerating forest &gt;5m tall; per Appendix 9-B), BS3 jack pine/blueberry/lichen, BS4 jack pine – black spruce/feathermoss, BS7 black spruce/blueberry/lichen, BS9 black spruce – jack pine/feathermoss, BS14 white birch/lingonberry – labrador tea, BS16 black spruce/ balsam poplar/river alder swamp, BS17 black spruce treed bog, and BS21 tamarack treed fen. While these ecosites were selected for the <i>potential</i> to have larger diameter trees, it is important to note that the majority of these ecosites have trees with diameter at breast height &lt;10 cm. Refer Appendix 9-B for representative photos of the selected ecosites.</p> <p>Based on this conservative mapping exercise, the Project Area contains small areas of suitable potential maternal roost habitat. The total Project Area is around 170 ha and potential bat maternal roost ecosites represent less than 49 ha, when as noted above it is assumed that the ecosites identified above provide trees suitable for maternity roosts across their entirety.</p> <p>The above text has been added to Appendix 9-F of the final EIS along with Figure IR-174 Round 3-3. We reiterate that the additional information collated and displayed in the maps provided to support this IR response is consistent with and does not contradict anything presented in the draft EIS documentation.</p> <p>We also refer the reviewer to Appendix 9-D for a summary of species-specific mitigation measures for bats; text from Section 3.3.3 has been included below in <i>italicized font</i> for ease of review:</p> <p><i>Bat Species</i></p> <ul style="list-style-type: none"><li><i>Vegetation clearing activities will occur outside of roosting periods, when practical.</i></li><li><i>Pre- disturbance wildlife clearance surveys will be completed to identify site-specific habitat features such as maternal rooting sites and hibernacula used by bat species. If features are identified in the Project Footprint,</i></li></ul>	<p>(date), precipitation, temperature, forest cover, Ecosite and proximity to water/wetland. Appropriate statistical methods to compare pre-construction baseline and 2019 baseline data spatially and temporally will be employed and accompanied by power analysis.</p> <p>Results of acoustic bat surveys will be submitted to Saskatchewan's Conservation Data Centre.</p> <p>4. Commitment 9-37 has been updated in version 3 of Denison's commitment register (additions in bold) and now reads: "<b>Pre-construction baseline</b> acoustic bat surveys will be completed prior to construction, building on the 2019 surveys (Appendix 9-B). The surveys will determine the presence/non-absence, diversity and relative abundance of bat species in the Project Area. <b>Results of acoustic bat surveys will be submitted to Saskatchewan's Conservation Data Centre</b>".</p>

VC	Valued Component

# Introduction

## Background

On October 21, 2022, Denison Mines Corp. (Denison) submitted a draft Environmental Impact Statement (EIS) for the proposed Wheeler River Project (the Project). Based on their initial review, the Canadian Nuclear Safety Commission indicated that the submission contained the required information to proceed with the Federal-Indigenous Review Team (FIRT) technical review of the draft EIS. On March 20, 2023, the FIRT provided Denison with a list of information requests (IRs) for Denison to respond to and eventually submit a final EIS document.

This Appendix provides additional information to address several IRs provided by Environment and Climate Change Canada (ECCC) as part of the initial round of Federal Indigenous Review Team (FIRT) comments. These IRs were related to 16 wildlife species at risk (SAR) listed under Schedule 1 of the federal *Species at Risk Act* (SARA). The draft EIS approach was conservative in that it considered appropriate representative species as Valued Components (VCs) and Key Indicators (KIs) in sections 9.3 Ungulates, Furbearers, and Woodland Caribou and 9.4 Raptors, Migratory Breeding Birds, and Bird SAR. Of the 16 wildlife SAR listed in Table 0.1, seven had been included as VCs or KIs in the EIS after a thorough scoping process (refer to Section 0 for additional information).

Nine of the sixteen were not included as individual VCs or KIs but are considered important from a regulatory perspective. The SARA-listed species identified by ECCC are listed in Table 0.1. Those noted in bold font indicate those for which further assessment is provided in this appendix.

**Table 0.1 Wildlife Species at Risk Listed by Environment and Climate Change Canada**

Common Name	Scientific Name	Discussed in the draft EIS
<b>Nine-spotted lady beetle</b>	<b><i>Coccinella ovemnotata</i></b>	No
<b>Transverse lady beetle</b>	<b><i>Coccinella transversoguttata</i></b>	No
<b>Yellow-banded bumble bee</b>	<b><i>Bombus terricola</i></b>	No
<b>Northern leopard frog</b>	<b><i>Lithobates pipiens</i></b>	No
<b>Little brown myotis</b>	<b><i>Myotis lucifugus</i></b>	No
<b>Northern myotis</b>	<b><i>Myotis septentrionalis</i></b>	No
Wolverine	<i>Gulo gulo</i>	Yes
Woodland caribou	<i>Rangifer tarandus caribou</i>	Yes
<b>Bank Swallow</b>	<b><i>Riparia riparia</i></b>	No
<b>Barn Swallow</b>	<b><i>Hirundo rustica</i></b>	No
Common Nighthawk	<i>Chordeiles minor</i>	Yes
<b>Horned Grebe</b>	<b><i>Podiceps auritus</i></b>	No
Olive-sided Flycatcher	<i>Contopus cooperi</i>	Yes

Common Name	Scientific Name	Discussed in the draft EIS
Rusty Blackbird	<i>Euphagus carolinus</i>	Yes
Short-eared Owl	<i>Asio flammeus</i>	Yes
Yellow Rail	<i>Coturnicops noveboracensis</i>	Yes

Of the 16 species listed in Table 0.1, seven had been included as VCs or KIs in the EIS after a thorough scoping process, as summarized below.

## Valued Component Selection

The VCs considered in the effects assessment for the Project are aspects of the biophysical and human environments that were considered to be likely to be affected (adversely or positively) by the Project. The VCs reflect identified scientific, local knowledge, and Indigenous Knowledge, and community interests regarding the Project and its potential effects. The potential effects are typically identified early in the environmental assessment process as a result of questions and concerns raised through engagement with Indigenous and community groups, government departments and agencies, and the general public.

Denison reviewed and considered all received input to develop a VC list that reflects the key environmental, socio-economic, heritage, and human health components and interests to appropriately focus the EA.

The initial VCs selected to represent bird SAR in the habitat-based assessment that were provided in the Terms of Reference (Denison 2019) were evaluated, consolidated, and organized to allow for the logical assessment of Project effects, and are presented in Table 0.2 and Table 0.3, which formed the basis for the subsequent VC-specific assessment.

**Table 0.2 Wildlife Species at Risk Valued Component and Rationale for their Inclusion in the Habitat-based Environmental Assessment for the Denison Wheeler River Project**

Valued Component	Rationale
<b>Biophysical Environment</b>	
<b><i>Terrestrial Environment</i></b>	
Furbearers	Project activities and infrastructure may affect local furbearer populations, including species at risk (SAR), resulting in non-compliance with permit conditions (e.g., <i>Species at Risk Act</i> [SARA; Government of Canada 2022], <i>The Wildlife Act 1998</i> [Government of Saskatchewan 2020]).
Woodland Caribou	Project activities and infrastructure may affect woodland caribou populations, resulting in non-compliance with permit conditions (e.g., SARA [Government of Canada 2022], <i>The Wildlife Act, 1998</i> [Government of Saskatchewan 2020]).

Valued Component	Rationale
Bird Species at Risk	Project activities and infrastructure may affect bird SAR (specifically disturbance and/or destruction of eggs, young, and adults) resulting in non-compliance with regulatory requirements (e.g., SARA [Government of Canada 2022], <i>Migratory Birds Convention Act 1994</i> [Government of Canada 2017], <i>Saskatchewan Activity Restriction Guidelines for Sensitive Species</i> [Government of Saskatchewan 2017], <i>The Wildlife Act 1998</i> [Government of Saskatchewan 2020]).

**Table 0.3 Valued Components, Key Indicators, and Measurable Parameters for the Wildlife Component included in the Habitat-based Environmental Assessment for Denison Wheeler River Project**

Valued Component	Key Indicator	Measurable Parameter
Furbearers	Wolverine	Amount of habitat (km <sup>2</sup> ) (not necessarily occupied) that may be altered or lost relative to its availability in the Regional Study Area (RSA). The number of wolverine mortalities directly or indirectly attributable to the Project.
Woodland Caribou	Woodland caribou	Amount of habitat (km <sup>2</sup> ) (not necessarily occupied) that may be altered or lost relative to its availability in the RSA. The number of woodland caribou mortalities directly or indirectly attributable to the Project.
Bird Species at Risk	Common Nighthawk	Percentage of habitat for Common Nighthawk altered/lost directly or indirectly as a result of Project activities. The number of Common Nighthawk mortalities directly or indirectly attributable to the Project.
	Rusty Blackbird	Percentage of habitat for Rusty Blackbird altered/lost directly or indirectly as a result of Project activities. The number of rusty blackbird mortalities directly or indirectly attributable to the Project
	Olive-sided Flycatcher	Percentage of habitat for Olive-sided Flycatcher altered/lost directly or indirectly as a result of Project activities. The number of Olive-sided Flycatcher mortalities directly or indirectly attributable to the Project
	Short-eared Owl	Percentage of habitat for Short-eared Owl altered/lost directly or indirectly as a result of Project activities. The number of Short-eared Owl mortalities directly or indirectly attributable to the Project.

Valued Component	Key Indicator	Measurable Parameter
	Yellow Rail	Percentage of habitat for Yellow Rail altered/lost directly or indirectly as a result of Project activities.  The number of Yellow Rail mortalities directly or indirectly attributable to the Project.

The five bird species identified in Table 0.3 were selected as SAR VCs for the habitat-based EA in consideration of information/responses received during extensive Indigenous and community engagement completed by Denison, and they represent wildlife species of local importance. For these five species, additional information is not be provided in this Appendix. Rather, the reader is referred to the applicable sections in the EIS where appropriate information on existing conditions (Section 9.4.3.3), potential project-related effects (Section 9.4.4), mitigation measures (Section 9.4.5), residual effects and their significance (Section 9.4.6), and cumulative effects (Section 9.4.7) is provided.

## Supplemental Information

As requested by ECCC, the following subsections provide supplemental information for the remaining nine species listed in Table 0.1 that were not included as VCs or KIs in the EIS. For these nine species, a brief overview of life history requirements (existing environment), a discussion on the effects assessment and mitigation measures, and a summary of residual and cumulative effects are included.

**Table 0.1 Wildlife Species At Risk Considered in the Wheeler River Project Environmental Impact Statement**

Common Name	Scientific Name	Provincial Status	Federal Status <sup>1</sup>	Preferred Habitat	Documented Occurrence in the Local Study Area <sup>2</sup>	Reference in the Environmental Impact Statement (EIS)
<b>Arthropods</b>						
Nine-spotted lady beetle	<i>Coccinella novemnotata</i>	S4	Endangered	Habitat generalist – uses a diverse range of habitats and consumes a variety of prey. See Section 0 for further details.	Unlikely LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date.	Not included as a Valued Component (VC) in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.
Transverse lady beetle	<i>Coccinella transversoguttata</i>	S4	Special Concern	Habitat generalist – uses a diverse range of habitats and consumes a variety of prey. See Section 0 for further details.	Unlikely LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date.	Not included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.
Yellow-banded bumble bee	<i>Bombus terricola</i>	S4	Special Concern	Habitat generalist – uses a variety of habitats and consumes nectar and pollen from many different flowering plants. See Section 0 for further details.	Unlikely LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date.	Not included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.
<b>Amphibians</b>						
Northern leopard frog	<i>Lithobates pipiens</i>	S3	Special Concern	Three district habitats: (1) overwintering waterbodies that are cold, well oxygenated, and do not freeze to	LSA is located within COSEWIC range; no observations in SKCDC	Not included as a VC in the EIS. 				areas and suitable locations for roosting and maternity colonies. See Section 0 for further details.	present in the LSA and RSA (Appendix 9-C).	
<b>Terrestrial Wildlife Species</b>						
Wolverine	<i>Gulo gulo</i>	S2	Special Concern	See Section 9.3.3.2 of the EIS for details.	LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date.	Included as a Key Indicator (KI) of the Furbearer VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Woodland caribou	<i>Rangifer tarandus caribou</i>	S3	Threatened	See Section 9.3.3.3 of the EIS for details.	Documented within the RSA during the baseline field program (Appendix 9-C)	Included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
<b>Avian Species</b>						
Bank Swallow	<i>Riparia riparia</i>	S4B, S5M	Threatened	Nesting colonies are typically characterized by steep embankments with a sand, silt, or clay substrate that can be easily excavated for burrows. They are often adjacent to slow-moving or still waterbodies and may occur in natural habitats or in anthropogenic features. Bank Swallows are aerial insectivores that forage over a variety of	LSA is located within COSEWIC range; no historical observations documented by the SKCDC (2023) and no Project-specific observations to date.	Not included as a KI of the Bird Species at Risk (SAR) VC in the EIS (Common Nighthawk was used as a surrogate species). A review of life history requirements and discussion on effects assessment are included in this Appendix. Any new species-specific mitigation measures identified in this appendix will be added to the final EIS (Section 9.4.5).

Common Name	Scientific Name	Provincial Status	Federal Status <sup>1</sup>	Preferred Habitat	Documented Occurrence in the Local Study Area <sup>2</sup>	Reference in the Environmental Impact Statement (EIS)
				open habitats. See Section 0 for further details.		
Barn Swallow	<i>Hirundo rustica</i>	S4B	Threatened	Breeding habitat typically requires a suitable nesting site with a vertical or horizontal surface underneath a roof of some sort, open areas for foraging, and a waterbody with mud for nest building. Anthropogenic features such as barns, houses, bridges, and culverts are commonly used nesting sites. See Section 0 for further details.	Documented during the breeding bird surveys as part of the baseline field program as present in the LSA (Appendix 9-C), and previously observed in the RSA (SKCDC 2023)	Not included as a KI of the Bird SAR VC in the EIS (Common Nighthawk was used as a surrogate species). A review of life history requirements and discussion on effects assessment are included in this Appendix. Any new species-specific mitigation measures identified in this appendix will be added to the final EIS (Section 9.4.5).
Common Nighthawk	<i>Chordeiles minor</i>	S4B	Special Concern	See Section 9.4.3.3 of the EIS for details.	Documented during the baseline field program as present in the LSA (Appendix 9-C), and previously observed in the RSA (SKCDC 2023)	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Horned Grebe	<i>Podiceps auritus</i>	S5B	Special Concern	Breeding habitat consists of small to medium-sized freshwater lakes, ponds, and marshes that are shallow with open water (at least 40%), emergent vegetation, anchorage for nests, and concealment for nests and young. See Section 0 for further details.	Documented during the baseline field program as present in the LSA (Appendix 9-C).	Not included as a KI of the Bird SAR VC in the EIS (Yellow Rail was used as a surrogate species). A review of life history requirements and discussion on effects assessment are included in this Appendix. Any new species-specific mitigation measures identified in this appendix will be added to the final EIS (Section 9.4.5)..
Olive-sided Flycatcher	<i>Contopus cooperi</i>	S4B	Special Concern	See Section 9.4.3.3 of the EIS for details.	Documented during the baseline field program	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and

Common Name	Scientific Name	Provincial Status	Federal Status <sup>1</sup>	Preferred Habitat	Documented Occurrence in the Local Study Area <sup>2</sup>	Reference in the Environmental Impact Statement (EIS)
					as present in the LSA (Appendix 9-C), and previously observed in the RSA (SKCDC 2023)	discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Rusty Blackbird	<i>Euphagus carolinus</i>	S3B, SUN	Special Concern	See Section 9.4.3.3 of the EIS for details.	LSA is located within COSEWIC range; no historical observations documented by the SKCDC (2023) and no Project-specific observations to date.	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Short-eared Owl	<i>Asio flammeus</i>	S3B, S2N	Special Concern	See Section 9.4.3.3 of the EIS for details.	LSA is located within COSEWIC range; no historical observations documented by the SKCDC (2023) and no Project-specific observations to date.	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Yellow Rail	<i>Coturnicops noveboracensis</i>	S3B	Special Concern	See Section 9.4.3.3 of the EIS for details.	LSA is located within COSEWIC range; no historical observations documented by the SKCDC (2023) and no Project-specific observations to date.	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.

Note: shaded rows indicate SAR was included as a VC or KI in the draft EIS

1 Schedule 1 under the *Species at Risk Act*.

- 2 Potential for Occurrence – based on known species occurrence data from Saskatchewan Conservation Data Centre (2023), Omnia (Appendix 9-C), Birds of Saskatchewan (2019), and Atlas of Saskatchewan Birds (Smith 1996) and/or presence of suitable habitat.

## Arthropods

### Nine-Spotted Lady Beetle

The nine-spotted lady beetle is a small beetle species found across southern Canada and the continental United States (COSEWIC 2016a). Its northern range limit in Saskatchewan is reported to occur near Lake Athabasca (COSEWIC 2016a). Based on records provided by the Saskatchewan Conservation Data Centre Hunting, Angling and Biodiversity of Saskatchewan (HABISask) database (SKCDC 2023), there are no historical observations of this species documented in the Regional Study Area (RSA).

Source: COSEWIC (2016a).

The nine-spotted lady beetle is a habitat generalist that uses a diverse range of habitats (e.g., open to semi-open forests, grasslands, riparian areas) and consumes a variety of prey (e.g., many species of arthropods [particularly aphids], sap, nectar and pollen) (COSEWIC 2016a). Being a habitat generalist allows the nine-spotted lady beetle to exploit seasonally available prey sources, with prey availability influencing the species' distribution more than habitat availability (COSEWIC 2016a).

The nine-spotted lady beetle has four life stages (i.e., egg, larva, pupa, and adult) and may produce two generations per year (i.e., spring and fall) depending on regional climate conditions (COSEWIC 2016a). Lady beetles, in general, are highly mobile and may undertake short (few hundred metres) and long-distance (18 to 120 km) movements (COSEWIC 2016a). The nine-spotted lady beetle is not migratory nor does it display strong site fidelity (COSEWIC 2016a). The nine-spotted lady beetle overwinters in aggregations in well-ventilated habitats (e.g., in rock crevices, grass tussocks, or leaf litter, or under stones or tree bark), becoming active in the early spring when temperatures start to increase (COSEWIC 2016a).

The nine-spotted lady beetle is federally listed under Schedule 1 of SARA as Endangered (Government of Canada 2023) and is designated as an S4 species in Saskatchewan (i.e., Apparently Secure) (Saskatchewan Conservation Data Centre 2023). The species has undergone significant population declines in Canada since 1975, going from one of the more common lady beetles collected to being rarely collected relative to other lady beetles, despite comprehensive and targeted surveys (COSEWIC 2016a). Reasons for these population declines are currently unknown but are thought to be driven by competition, predation, and introduced diseases from non-native species (including non-native lady beetles), agricultural pesticide use to control aphids, habitat loss via urban expansion, and other human disturbances (COSEWIC 2016a).

## Transverse Lady Beetle

The transverse lady beetle is a small beetle species found across the United States and Canada, including all provinces and territories (COSEWIC 2016b). The species is a habitat generalist and uses similar habitat types and consumes similar prey as the nine-spotted lady beetle, which means it is also able to exploit seasonally available prey sources (COSEWIC 2016b). According to the information from the HABISask database, there are no historical observations of this species documented in the RSA.

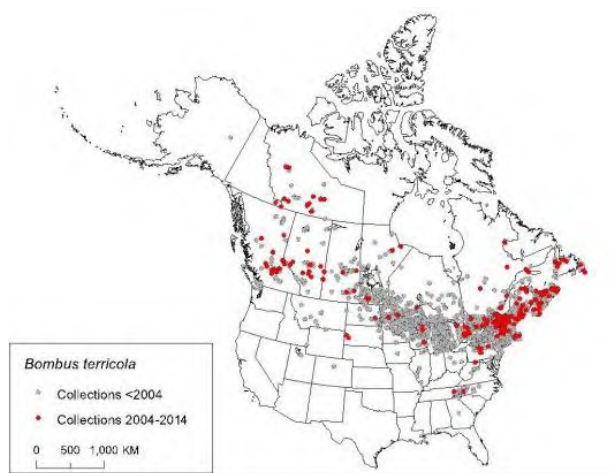

Source: COSEWIC (2016b).

The transverse lady beetle has four life stages (i.e., egg, larva, pupa, and adult) and may produce two generations per year (i.e., spring and fall) depending on regional climate conditions (COSEWIC 2016b). Lady beetles in general are highly mobile and may undertake short (few hundred metres) and long-distance (18 to 120 km) movements (COSEWIC 2016b). The transverse lady beetle is not migratory nor does it display strong site fidelity (COSEWIC 2016b). The transverse lady beetle overwinters in aggregations in well-ventilated habitats (e.g., in rock crevices, grass tussocks, or leaf litter, or under stones or tree bark), becoming active in the early spring when temperatures start to increase (COSEWIC 2016b).

The transverse lady beetle is federally listed under Schedule 1 of SARA as Special Concern (Government of Canada 2023) and is designated as an S4 species in Saskatchewan (i.e., Apparently Secure) (Saskatchewan Conservation Data Centre 2023). The species was once abundant across its range in Canada and was one of the most common lady beetles collected; however, since 1986, the species is now absent, below detection limits, or present in low numbers in many parts of its range (COSEWIC 2016b). The transverse lady beetle has not been detected in Saskatchewan since 2001 (COSEWIC 2016b). Reasons for these population declines are currently unknown but are thought to be driven by the same factors listed for the nine-spotted lady beetle in Section **Error! Reference source not found..**

## Yellow-banded Bumble Bee

The yellow-banded bumble bee is a medium-sized bumble bee species found throughout eastern North America, from eastern British Columbia (BC) to Newfoundland and Labrador and from the northern United States up to the southern portion of the territories (COSEWIC 2015). The species is a habitat generalist (e.g., boreal habitats, mixed woodlands, montane meadows) and consumes nectar and pollen from many different flowering plants (COSEWIC 2015). According to the information from the HABISask database, there are no historical observations of this species documented in the RSA.

Source: COSEWIC (2015).

The yellow-banded bumble bee has four life stages (i.e., egg, larva, pupa, and adult) and produces one generation per year, with mated queens establishing new colonies each year (COSEWIC 2015).

After overwintering underground in loose soil or decomposing organic material, the mated queens emerge in the spring and search for potential nest sites, which are typically located underground in existing cavities (e.g., abandoned rodent burrows, rotten logs, openings in dead wood, and grassy hummocks) (COSEWIC 2015). Once a queen has found a suitable nest site, she forages for nectar and pollen and then returns to her nest site to lay eggs, which will develop into her future workers (i.e., unmated daughters that do not typically reproduce) (COSEWIC 2015). After the initial eggs hatch and the larva and pupa develop into adult workers, the workers take over nest and brood care, foraging duties, and colony protection while the queen continues to lay eggs (COSEWIC 2015). Males and potential queens are produced by late summer once the colony reaches maximum worker production, at which point they leave the colony and mate (COSEWIC 2015). All males and workers die by fall while the mated queens hibernate through the winter in suitable overwintering sites (COSEWIC 2015).

The yellow-banded bumble bee is federally listed under Schedule 1 of SARA as Special Concern (Government of Canada 2023) and is designated as an S4 species in Saskatchewan (i.e., Apparently Secure) (Saskatchewan Conservation Data Centre 2023). Prior to the 1990s, the yellow-banded bumble bee was one of the more common bumble bees collected in eastern and boreal Canada (COSEWIC 2015, Environment and Climate Change Canada 2022a). Population declines started to occur in the early 1990s, with an average rate of decline of 66.5% in proportional abundance across central and southern Canada between 1992 and 2011 (COSEWIC 2015, Environment and Climate Change Canada 2022a). The species is no longer found at several historical collection sites (COSEWIC 2015).

The status of the yellow-banded bumble bee in boreal habitats and Arctic regions is unknown (COSEWIC 2015, Environment and Climate Change Canada 2022a). Reasons for these population declines are currently unknown but are thought to be driven by introduced diseases from managed bumble bee species, agricultural pesticide use, habitat loss via urban and agricultural expansion, and climate change (COSEWIC 2015). The species' unique type of sex determination, where colonies must reach maximum worker production to produce males and potential queens, has been identified as a limiting factor (COSEWIC 2015, Environment and Climate Change Canada 2022a).

## Amphibians

### Northern Leopard Frog

The northern leopard frog is found across most of west-central and northeastern North America (COSEWIC 2009a). The species is widespread in Canada, ranging from southeastern BC to Labrador, and from southcentral Northwest Territories (COSEWIC 2009a, NCC 2023).

Source: COSEWIC (2009a).

Three distinct habitats are used by the northern leopard frog on an annual basis: (1) overwintering waterbodies that are cold, well oxygenated, and do not freeze to bottom (e.g., rivers, streams, deep lake ponds and creeks, and spillways below dams); (2) breeding and larval waterbodies with shallow, open habitats (e.g., ponds, lakeshores, marshes, and slow-moving streams; may be permanent or semi-permanent), neutral

pH, well vegetated, and no fish; and (3) summering areas in shallow marshes, moist upland meadows, forests and grasslands where grass height is less than 1 m (COSEWIC 2009a, NCC 2023). These habitats must be in proximity with suitable dispersal corridors interconnecting them (e.g., riparian areas and waterways) as the species is not capable of long-distance movements (COSEWIC 2009a, Environment Canada 2013).

Northern leopard frogs emerge from their overwintering waterbodies in early spring shortly after ice off (COSEWIC 2009a). The breeding season extends from mid-April to June, with exact timing dependent on location and latitude (COSEWIC 2009a). Females lay several thousand eggs, attaching them to submerged vegetation, which develop into tadpoles within two weeks depending on water temperatures (COSEWIC 2009a). The tadpoles in turn develop into small frogs over a two-to-three-month period, after which they migrate to their summering areas and forage on a variety of arthropods, worms, and snails, sometimes preying on small birds and smaller frogs (COSEWIC 2009a).

Three populations are recognized for the northern leopard frog in Canada: the Rocky Mountain, the Western Boreal/Prairie, and the Eastern (COSEWIC 2009a, NCC 2023). The Western Boreal/Prairie population is found in Alberta, Saskatchewan, Manitoba, and the Northwest Territories (COSEWIC 2009a, NCC 2023). The Western Boreal/Prairie population is federally listed under Schedule 1 of SARA as Special Concern (Government of Canada 2023) and is designated as an S3 species in Saskatchewan (i.e., Vulnerable) (Saskatchewan Conservation Data Centre 2023).

Population data are limited for the northern leopard frog in Canada (COSEWIC 2009a, Environment Canada 2013). Large-scale population declines occurred in the early 1970s, with populations in western Canada (i.e., BC and Alberta) most dramatically affected (COSEWIC 2009a). Information is lacking on the current status of northern leopard frog populations in Saskatchewan (COSEWIC 2009a, Environment Canada 2013).

Threats to the northern leopard frog include emerging diseases (e.g., *Chytridiomycosis*), introduced non-native species, habitat loss and fragmentation, environmental contamination, and increased frequency and severity of droughts (COSEWIC 2009a). The species' specific habitat requirements and vulnerability to diseases and prolonged periods of drought have been identified as limiting factors (Environment Canada 2013).

## Bats

### Little Brown Myotis

The little brown myotis is a small bat species found across North America, including across Canada south of the treeline (COSEWIC 2013a). The species is considered a short-distance regional migrant between its summer and winter ranges, with the distance travelled dependent on the location of suitable overwintering hibernacula (COSEWIC 2013a).

Habitat for the little brown myotis is composed of (1) overwintering hibernacula that are sufficiently cool and humid and (2) summering areas that provide foraging areas and suitable locations for roosting and maternity colonies (COSEWIC 2013a). Hibernacula and maternity

Source: COSEWIC (2013a).

sites are the main limiting habitat features for this species (COSEWIC 2013a). Hibernacula occur in parts of caves, mines, and buildings that have stable and specific temperature (-4 to 13°C) and humidity (>80%) conditions (COSEWIC 2013a). Maternity sites occur in large-diameter trees, rock crevices, buildings, and bat houses that offer warm and relatively stable microclimate conditions that allow females to avoid going into torpor so they can focus on caring for their young (COSEWIC 2013a, Slough and Jung 2020). Males are more versatile in their summer roosting requirements and use tree cavities, raised bark, foliage, rock crevices, buildings, and bridges with a broader range of microclimate conditions (COSEWIC 2013a, Johnson et al. 2019). Foraging areas for the little brown myotis include a variety of habitats situated close to roosting and maternity sites, including over water (e.g., wetlands, lakes, ponds, and rivers), along riparian areas and forest edges, and in forest gaps (COSEWIC 2013a).

The little brown myotis is federally listed under Schedule 1 of SARA as Endangered (Government of Canada 2023) and is designated as an S4B, S4N species in Saskatchewan (i.e., Apparently Secure breeding population, Apparently Secure non-breeding population) (Saskatchewan Conservation Data Centre 2023).

The current size of the little brown myotis population in Canada is unknown. Prior to the arrival of White-nose Syndrome in 2010, the population in Canada was estimated to be over one million individuals (COSEWIC 2013a, Environment and Climate Change Canada 2018). White-nose Syndrome is a disease that causes high rates of mortality among hibernating bats, and it has been identified as the main threat for bat populations in Canada (COSEWIC 2013a). Other threats to the little brown myotis include habitat loss, colony eradication, chemical contamination, and wind turbines (COSEWIC 2013a).

## Northern Myotis

The northern myotis is a small bat species found across North America, including across Canada south of the treeline (COSEWIC 2013a). The species is considered a short-distance regional migrant between its summer and winter ranges, with the distance travelled dependent on the location of suitable overwintering hibernacula (COSEWIC 2013a).

Habitat for the northern myotis is composed of (1) overwintering hibernacula that are sufficiently cool and humid and (2) summering areas that provide foraging areas and suitable locations for roosting and maternity colonies (COSEWIC 2013a). Hibernacula and maternity sites are the main limiting habitat features for this species (COSEWIC 2013a). Hibernacula occur in parts of caves, mines, and buildings that have stable and specific temperature (0.6 to 14°C) and humidity (>80%) conditions (COSEWIC 2013a). Summer roosting trees are typically found in mature to old-growth forests, swamps, and riparian areas, although retained older trees and snags in younger forests may occasionally provide suitable roosting habitat (Environment and Climate Change Canada 2018). Females strongly prefer tall, large-diameter trees (both living and dead, typically deciduous) with early- to mid-decay for maternity sites (COSEWIC 2013a, Environment and Climate Change Canada 2018). Anthropogenic features (e.g., barns) may occasionally be used as maternity sites in fragmented landscapes with few potential roost trees (Environment and Climate Change Canada 2018). Maternity sites that maintain warm and relatively stable microclimate conditions are important to reproductive females and young as they allow more energy to be directed toward growth and development (Caceres and Barclay 2000, COSEWIC 2013a). Males are more versatile in their summer roosting requirements; they most frequently roost under exfoliating, raised bark but may also roost in the cavities and crevices of trees and snags with early- to mid-decay (Jung et al. 2004, COSEWIC 2013a).

The northern myotis is well adapted to flying in areas of dense or structurally complex vegetation where it catches flying insects on the wing or feeds by gleaning prey from foliage (Caceres and Barclay 2000, Henderson and Broders 2008). The species typically forages within the interior of mature to old-growth deciduous and mixedwood forests, but may also forage in forest gaps, along forest edges and riparian areas, and over rivers (Henderson and Broders 2008, COSEWIC 2013a).

The northern myotis is federally listed under Schedule 1 of SARA as Endangered (Government of Canada 2023) and is designated as an S3 species in Saskatchewan (i.e., Vulnerable) (Saskatchewan Conservation Data Centre 2023). The current size of the northern myotis population in Canada is unknown. Prior to the arrival of White-nose Syndrome in 2010, the population in Canada was estimated to be over one million individuals (COSEWIC 2013a, Environment and Climate Change Canada 2018). White-nose Syndrome has been identified as the main threat for northern myotis

Source: COSEWIC (2013a).

populations in Canada (COSEWIC 2013a). . Other threats to the northern myotis include habitat loss, colony eradication, chemical contamination, and wind turbines (COSEWIC 2013a)

## Avian Species

### Bank Swallow

The Bank Swallow is a small songbird that occurs on every continent (except Antarctica and Australia), breeds throughout Canada, and winters primarily in South America (COSEWIC 2013b). Nesting colonies are typically characterized by steep embankments with a sand, silt, or clay substrate that can be easily excavated for burrows (COSEWIC 2013b, Government of Canada 2019a). These steep sand, silt, or clay embankments are frequently subject to erosion or slumping (COSEWIC 2013b, Garrison and Turner 2020).

Nesting colonies are often adjacent to slow-moving or still waterbodies (e.g., low gradient rivers or lakes) and may occur in natural habitats or in anthropogenic features (e.g., quarries or road cuts) (COSEWIC 2013b, Government of Canada 2019a, Garrison and Turner 2020). Colony size can range from less than half a dozen burrows to hundreds or thousands of burrows (COSEWIC 2013b, Government of Canada 2019a). Individual burrows within colonies may be recolonized in subsequent years if the integrity of the colony remains intact (i.e., does not erode and collapse) (Garrison and Turner 2020). Bank Swallows are aerial insectivores that forage over a variety of open habitats such as lakes, ponds, rivers, wetlands, grasslands, and agricultural areas (COSEWIC 2013b, Garrison and Turner 2020).

The Bank Swallow is federally listed under Schedule 1 of SARA as Threatened (Government of Canada 2023) and is designated as an S4B, S5M species in Saskatchewan (i.e., Apparently Secure breeding population, Secure aggregating transient population [migrants]) (Saskatchewan Conservation Data Centre 2023). The most recent breeding population estimate for Canada is 2.4 million individuals (Environment and Climate Change Canada 2022b). Based on Breeding Bird Survey (BBS) data collected between 1970 and 2019, the Bank Swallow population in Canada has declined at a rate of 5.3% per year, for an overall decline of 98.0% (Environment and Climate Change Canada 2022b). The long-term population decline appears to be driven by several threats acting cumulatively, including loss of nesting and foraging habitats, incidental take during anthropogenic activities (e.g., aggregate extraction and erosion control), large-scale declines in aerial insect populations, and climate change (COSEWIC 2013b). Bank Swallows are also particularly vulnerable to collisions with vehicles partly due to the attraction of individuals to intraspecific carcasses; one swallow hit by a vehicle could attract several individuals to a road, potentially resulting in subsequent collisions and large mortality events (COSEWIC 2013b, Garrison and Turner 2020).

Although colonial nesting may provide advantages (e.g., predation protection and assistance with thermoregulation), it has been identified as a limiting factor for the Bank Swallow, potentially making

Source: COSEWIC (2013b).

them more vulnerable to natural events or anthropogenic activities, which may result in mass mortality events (Environment and Climate Change Canada 2022b).

## Barn Swallow

The Barn Swallow is a medium-sized songbird that occurs on every continent (except Antarctica), breeds throughout Canada, and winters in the southern United States, Mexico, and southwards (COSEWIC 2021). Breeding habitat typically requires a suitable nesting site with a vertical or horizontal surface underneath a roof of some sort, open areas for foraging (e.g., grasslands, fields, wetlands, and shorelines), and a waterbody with mud for nest building (Government of Canada 2019b, Brown and Brown 2020, COSEWIC 2021). Historically, suitable nesting sites were likely provided by caves, cliff faces, rock ledges, tree branches, and hollow trees (Brown and Brown 2020, COSEWIC 2021). Today, nesting sites are usually located within agricultural and rural areas, and along roads and highways (Brown and Brown 2020, COSEWIC 2021). Anthropogenic features such as barns, houses, bridges, and culverts are commonly used for nesting sites (COSEWIC 2021). Barn Swallows nest in colonies or independently and typically return to the same nesting sites each year and may reuse old nests (Government of Canada 2019b, Brown and Brown 2020, COSEWIC 2021).

Source: COSEWIC (2021).

The Barn Swallow is federally listed under Schedule 1 of SARA as Threatened (Government of Canada 2023) and is designated as an S4B species in Saskatchewan (i.e., Apparently Secure breeding population) (Saskatchewan Conservation Data Centre 2023). An estimated 6.4 million individuals currently breed in Canada, with over 60% of the population breeding throughout the prairie provinces (COSEWIC 2021). Based on BBS data collected between 1970 and 2019, the Barn Swallow population in Canada has declined at a rate of 2.34% per year, for an overall decline of 68.6% (COSEWIC 2021). Intensification of agriculture, loss of nesting sites, large-scale declines in aerial insect populations, and climate change are cited as the most imminent threats for the Barn Swallow, and its dependence on aerial insects for prey and low post-fledging survival rates are cited as limiting factors for the species (COSEWIC 2021). The repeated use of anthropogenic features for nesting makes Barn Swallows vulnerable to incidental take, especially if the anthropogenic features require routine maintenance. In addition, their frequent use of anthropogenic features for nesting makes Barn Swallows vulnerable to entrapment (e.g., buildings, pipes, vents, other enclosed spaces) as they search for potential locations to build a nest (COSEWIC 2021).

## Horned Grebe

The Horned Grebe is a small waterbird that occurs in North America and Eurasia (COSEWIC 2009b). Within North America, the species breeds across western Canada from BC and Yukon across to the Magdalen Islands in Quebec

and winters along the Pacific and Atlantic coasts (COSEWIC 2009b).

Breeding habitat for the Horned Grebe consists of small to medium-sized freshwater lakes, ponds, and marshes that are shallow with open water (at least 40%), emergent vegetation, anchorage for nests, and concealment for nests and young (COSEWIC 2009b,

Source: COSEWIC 2009b

Stedman 2020). Horned Grebes use a range of waterbody sizes for breeding, but typically prefer waterbodies between 0.3 and 2.0 ha in size (COSEWIC 2009b). Most pairs are solitary, but loose colonies of up to 20 pairs have been found on larger waterbodies with abundant food resources (COSEWIC 2009b, Stedman 2020). Nests are typically located in shallow water near shore on a floating or emerging mass of vegetation (COSEWIC 2009b). Horned Grebes are diving birds that feed on a variety of aquatic arthropods and fish (COSEWIC 2009b, Stedman 2020).

The Western population of the Horned Grebe is federally listed under Schedule 1 of SARA as Special Concern (Government of Canada 2023) and is designated as an S5B species in Saskatchewan (i.e., Secure breeding population) (Saskatchewan Conservation Data Centre 2023). An estimated 200,000 to 500,000 individuals occur in the Western population, with most breeding in southern Alberta and Saskatchewan (COSEWIC 2009b, Environment and Climate Change Canada 2022c). Based on BBS data collected between 1970 and 2019, the Western population of the Horned Grebe in Canada has declined at a rate of 1.7% per year, for an overall decline of 57.0% (Environment and Climate Change Canada 2022c). The reasons for this population decline are unknown. Probable threats include permanent habitat loss, temporary loss of habitat during droughts, eutrophication and degradation of habitat due to fertilizers, predator expansion on the prairies, Type E botulism in the Great Lakes, entanglement in commercial fishing gear, climate change and extreme weather, and oil spills on wintering grounds (COSEWIC 2009b).

## Mitigation Measures

The Project will require the construction, operation, and decommissioning of several components (as described in Section 2 of the EIS). Expected interactions between these Project components and activities and the wildlife VCs and their associated KIs are summarized by Project phase and activity in Tables 9.3-6 and 9.4-5 of the EIS. Based on the timing and nature of interactions identified in Tables 9.3-6 and 9.4-5 of the EIS, the following adverse effects on the wildlife VCs, including SAR, are likely to occur during the lifetime of the Project:

- alteration and/or loss of habitat; and
- change in mortality.

These potential effects apply to Wildlife SAR as well. The potential effects are described in Sections 9.3.4.2 and 9.4.4.2 of the EIS for each Project phase as they may affect the wildlife VCs and associated KIs.

Mitigation in this EIS is defined as the elimination, reduction, or control of potential adverse effects of the Project on the environment throughout all Project phases. Project-specific mitigation measures include: Project design; implementation of best management practices; development of management plans; implementation of emergency response programs; and provision of training, education and awareness (Denison 2020). Mitigation measures for each potential effect are described in Sections 9.3.5 and 9.4.5 of the EIS. The following subsections summarize mitigation measures that will be implemented to avoid or minimize adverse effects on the Wildlife SAR.

### Project Design Measures

Potential adverse effects on Raptors, Migratory Breeding Birds, and Bird SAR VCs will be avoided or minimized to the extent practical through Project design. All of the Project design measures listed here are consistent with those presented in Section 9 of the EIS (i.e., there are no new Project design measures proposed in this appendix):

- The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent practicable resulting in reduced habitat disturbance and noise propagation.
- Much of the proposed footprint will be developed within previously disturbed areas, including roads currently used for exploration activities, thereby minimizing additional habitat disturbance.
- The powerline to the main substation at the site is relatively short (i.e., approximately 7 km) and will be constructed from the existing provincial power line adjacent to Highway 914.
- During Operation, progressive reclamation activities will be completed where possible, and the progress and success of these activities will be assessed annually.
- Cleared brush will be stockpiled when possible, to be used in progressive reclamation.
- Ongoing decommissioning of Project components will be completed when possible.
- Dust deposition on vegetation and waterbodies (including potential deposition of trace metals and radionuclides) will be reduced by:
  - directing processing plant exhaust from drying and packaging areas through a stack prior to release outside of the building;

- designing the stack height based on results of air dispersion modelling to be an appropriate height for optimal dispersion;
  - controlling access to the property with both a north and south security gate (the north gate is on a decommissioned road and the south gate is manned);
  - making a wash bay available to clean items, equipment and vehicles that may have been in contact with potentially contaminated materials. Contaminated water from the wash bay will be collected in a sump tank and routed to the water treatment plant for treatment and discharge;
  - conducting radiological clearance scanning as required for any items, equipment, and vehicles leaving the Project Area; and.
  - watering and traffic controls on roads.
- Battery-powered light vehicles and mobile equipment, and an AC powered dual rotary drill for ISR wellfield development instead of a traditional diesel-powered unit, will be employed, where practical, to reduce air emissions and noise levels and improve energy efficiency.
  - The main sources of noise will be related to transport of people and goods, drilling of holes for the freeze wall and wellfield, operation of the batch plant, operation of the processing plant, and operation of the pumphouses. The use of high-quality, low sound emission equipment and regular maintenance will reduce noise associated with Project activities.
  - Bulk storage tanks for processing chemicals such as sulphuric and/or hydrochloric acid, sodium hydroxide, and hydrogen peroxide will sit inside appropriately designed and sized secondary containment basins, physically separated from the containment basins for other chemical systems.
  - Surface pipelines will be designed to have secondary containment or catchment and have leak detection systems in place at key locations.
  - A freeze wall will be established around the uranium deposit to reduce groundwater disturbance.
  - Mining solution and process water will be reused throughout the mining process, reducing water use requirements to the extent feasible and reducing the volume of treated effluent requiring discharge. Make-up water will be preferentially sourced from site runoff where possible.
  - Double-walled, high-density polyethylene or equivalent piping will be used in the wellfields and will be freeze protected and secured to minimize pipe movement.
  - Contaminated wastes (e.g., mineralized drill cuttings, solid impurities removed from mining solution, dewatered reject solids) will be properly contained on a double lined waste pad with leak detection capabilities and an associated monitoring program. An adjacent pond will be used to collect runoff from the pad and water in the waste pond will be piped to the water treatment plant. Such waste will be disposed of either on site or off site at an approved facility.
  - The ISR wellfield and processing plant will be designed to re-use most of the solutions inside each circuit; any excess water will be released to a surface water body once acceptable water quality is achieved. All treated effluent released to surface water will meet federal and provincial regulatory discharge limits.

- All contaminated areas, such as waste ponds and pads, and the domestic landfill will be fenced to avoid contact with workers and wildlife. Fences will be monitored and maintained.

## General Mitigation Measures for Wildlife Species at Risk

Mitigation measures specific to the Wildlife SAR, in accordance with the *Migratory Birds Convention Act* and tailored to Project features will be incorporated into various Project management and monitoring plans such as the erosion and sediment controls, soil and vegetation monitoring, wildlife monitoring, the Decommissioning Plan, air quality monitoring, Spill Response Plan, Radiation Protection Plan, surface water and effluent monitoring and Waste Management Plan.

The management plans within the Environmental Management System (EMS) will provide specific mitigation measures based on proven and accepted mitigation measures following standard industry guidelines and best management practices. The EMS will provide guidance to avoid or minimize potential adverse effects of the Project on avian species and their habitat, including monitoring and follow-up programs, as appropriate. It will be in place during all phases of the Project and will be subject to ongoing review and revision as required. If monitoring identifies a need for additional or revised mitigation measures, a process of adaptive management (as described in the plan) will be triggered. The Project management plans provide direction on monitoring and adaptive management so that responses are timely and effective.

The following subsections provides a description of the mitigation measures that will be applicable during all Project phases and expected to be effective immediately following implementation. Additional mitigation measures specific to the Wildlife SAR that were not included or that were revised from what was described in the draft EIS are provided in **bold text**.

### Work Timing Windows and Habitat Disturbance

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the nesting season, when practical. **The nesting season for many Wildlife SAR in Saskatchewan spans a period from March 15 to August 31; however, the dates differ for certain species. The Wildlife Management Plans within the EMS will provide details on nesting windows for avian species, as well as other sensitive time periods (e.g., caribou calving periods) occurring in the Terrestrial RSA based on the Saskatchewan Activity Restriction Guidelines for Sensitive Species (SARGSS), which were established to support the avoidance of sensitive species' habitats during sensitive periods (SK MOE 2017).**
- **Prior to commencing any site clearing (i.e., vegetation clearing and/or soil disturbance) during the nesting and breeding season, pre-disturbance wildlife clearance surveys will be conducted by a Qualified Professional (QP) at that location within the Project Area to identify sensitive species and habitat features (e.g., nests as well as roosts and hibernacula used by bat species).**
- **Active and/or suspected breeding and roosting locations identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with regulatory guidelines (e.g., the 2017 SARGSS [SK MOE 2017]) in accordance with the level of the disturbance and species until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations). If guidelines cannot be met, due to safety or operational concerns, SK MOE will be contacted for advice on the appropriate response to the situation.**

## Wildlife Education and Awareness

- Employees and contractors will be provided with wildlife education and awareness training, including education about potential Wildlife SAR issues on site and training on the mitigation measures to avoid or minimize potential adverse Project effects on Wildlife SAR and their habitats.
- Employees and contractors will be educated on waste management policies that limit human-avian interactions.
- Designated employees will be trained in appropriate avian deterrent techniques to minimize avian interactions with the Project.
- **Employees and contractors will be requested to report avian observations on site, injured or dead birds (which will be reported to SK MOE). Avian encounters and outcomes will be monitored, and logbooks will be used to record observations. Logbooks and reports will be available to employees.**

## Wildlife and Habitat Protection

- Personal firearms will be prohibited for employees and contractors within the Project Area to prevent hunting activities.
- If any individual were seeking access around the Project area to undertake Aboriginal and/or Treaty Rights, Denison staff would facilitate this, provided it were safe to do so given activities in the area.
- Policies will be implemented prohibiting employees and contractors from feeding, approaching, or harassing avian species within the Project Area.
- To support habitat regeneration, progressive reclamation and ecosystem-based revegetation will be conducted on disturbed areas as soon as practicable in accordance with the Reclamation and Closure Plan.

## Wildlife Deterrence and Prevention of Wildlife Entrapment

- **Buildings and other Project infrastructure will be designed and maintained to exclude birds (e.g., barn swallows) and bats as much as possible. This would include installing solid barriers (e.g., corner slope panels, wooden panels) or flexible barriers (e.g., netting, tarps or geotextiles) under roof eaves or other exterior surfaces.**
- **Physical, visual, and/or auditory deterrents will be used to discourage bird and bat use of buildings and other Project infrastructure (e.g., water or waste treatment ponds) for refuge, shelter, breeding, and roosting, and to deter birds and bats from potentially becoming entrapped.**
- **Noise emitting Project activities will be managed to minimize sensory disturbance of wildlife SAR species, especially during sensitive time periods (i.e., breeding and nesting).**
- Low sound emission equipment, regular maintenance of equipment, and the use of silencers or mufflers (whenever practical) will be used to reduce noise associated with Project activities, to the extent practical.
- **Directed lighting or light shielding, rather than broad lighting, will be implemented to minimize sensory disturbance on the wildlife SAR, and lighting will be focused on work sites and not surrounding areas.**

- Dust generation and subsequent deposition on vegetation and in waterbodies (including potential deposition of trace metals and radionuclides) will be limited through dust suppression techniques such as road watering and traffic management.

## Road and Traffic Management

- Traffic and access control measures will be implemented will include reducing traffic volume by scheduling truck convoys, using high-volume haul trucks, and restricting public access to the Project site and roads (e.g., private vehicles, snowmobiles, all-terrain vehicles, and foot traffic). It is important to note that if any individual were seeking access around the Project area to undertake Aboriginal and / or Treaty Rights, Denison staff would facilitate this, provided it were safe to do so given activities in the area.
- Appropriate road signage will be installed (e.g., speed limits) along Project roads to raise awareness and minimize the potential for wildlife SAR-vehicle collisions.
- Wildlife will have the right-of-way on Project roads, unless it is unsafe to stop (i.e., if a collision is imminent). Vehicles will not be used to encourage wildlife to move off Project roads.
- Processes will be implemented for employees and contractors to slow down and/or stop vehicles/equipment to allow animals to move away or off the road before resuming normal road speeds for the area.
- Employees and contractors will report and communicate the location and circumstances of any roadkill observed on or alongside Project roads. Large-bodied wildlife carcasses found will be reported to SK MOE and disposed of as directed to discourage avian scavengers.
- **Vegetation management, such as mowing and brush cutting, will be implemented along Project roads to reduce site attractiveness for wildlife SAR and maintain appropriate sightlines for drivers to minimize wildlife-vehicle collisions.**
- Alternative measures on Project roads for de-icing and winter traction (e.g., sand, gravel) or dust suppression (e.g., water) will be implemented, whenever practicable.
- Appropriately sized gaps in the roadside snowbanks during winter will be maintained to facilitate wildlife crossing and escape thereby reducing the risk of wildlife-vehicle collisions.
- New Project site and access roads will be designed to minimize sightlines for predators, whenever practicable, while still maintaining general road safety.
- Ditches and culverts along Project roads will be designed and maintained to minimize pooling of water. Roadside pools that form may attract wildlife.

## Waste and Hazardous Materials Management

- A "no littering policy" for employees and contractors will be implemented within the Project Area.
- **Vegetation management will be incorporated in the vicinity of waste ponds to discourage wildlife SAR use of potentially affected vegetation.**
- Waste will be collected and temporarily stored in wildlife-proof containers to avoid attracting scavengers and with that increase the risk for human-wildlife interact.
- The wildlife-proof containers will be inspected regularly for evidence of avian presence (e.g., gull species) or access to waste disposal facilities. If evidence of avian presence or

access to waste disposal facilities is detected, modified systems will be implemented and/or off-site waste disposal frequencies will be increased.

- The use of hazardous materials will be limited as much as possible.
- Hazardous materials will be handled, stored, and disposed of appropriately and in accordance with a Waste Management Plan to avoid attracting avian scavengers (e.g., wildlife-proof containers, exclusion fencing).
- Physical deterrents (e.g., fencing) will be employed around contaminated areas (e.g., waste ponds and waste pads), the domestic landfill, or hazardous materials storage areas to discourage wildlife use.
- Appropriate hazardous materials management practices will be implemented in accordance with industry guidelines and a Waste Management Plan to minimize the risk of accidental spills or leakage.
- Appropriate spill response kits will be positioned adjacent to areas where hazardous materials are stored in accordance with the Spill Response Plan.
- A minimum 100 m distance from any waterbody will be maintained for fuel storage, refueling activities, or equipment servicing in accordance with the Spill Response Plan.
- Appropriate fuel, chemical, and materials management practices will be followed in accordance with the Spill Response Plan to minimize the risk of accidental spills or leakage of diesel fuel, other hydrocarbons, and other hazardous materials.
- Air emissions will be reduced to the extent practical through implementation of an air quality monitoring plan within the EMS.
- All vehicles and equipment will be equipped with industry-standard emission control systems; unnecessary idling of vehicles will be prohibited.
- Vehicles and equipment will be maintained in good working condition (e.g., no leaks) and furnished with industry-standard spill response kits.
- Mitigation measures to reduce the potential for dispersion of radiological contaminants of potential concern to vegetation will be implemented in accordance with the Radiation Protection Plan.
- Education on and enforcement of proper waste and hazardous materials management practices will be provided to employees and contractors.

## Species-Specific Mitigation Measures for Wildlife Species at Risk

The following provides a summary of the species-specific mitigation measures that will be implemented during Project activities. Mitigation measures specific to the Wildlife SAR that were not included or that were revised from what was described in the draft EIS are provided in **bold text**. These will be added to the final EIS.

### Arthropod Species

- Mitigation measures designed for the Soil and Organic Matter / Peat (Section 9.1.5) and Vegetation and Ecosystems (Section 9.2.5) VCs are expected to mitigate adverse effects on the arthropod species that are considered SAR (i.e., nine-spotted lady beetle, transverse lady beetle, and yellow-banded bumble bee) primarily related to limiting the loss and/or disruption of suitable habitat for these species. These include:

- The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent safely practicable resulting in reduced habitat disturbance and noise propagation.
- Much of the proposed Project Footprint will be developed within previously disturbed areas, including roads currently used for exploration activities, thereby minimizing additional habitat disturbance.
- During Operation, progressive reclamation will be completed where possible, and the progress and success of these activities will be assessed annually.
- **Herbicide use as part of vegetation management will be limited to the immediate Project Footprint and applied by licensed professional applicators, when necessary, to limit the potential for adverse effects on arthropod species.**

## Amphibian Species

- Mitigation measures designed for the Wetlands VC (Section 9.2.5) are expected to mitigate adverse effects on the northern leopard frog primarily related to limiting the loss and/or disruption of suitable habitat for these species. These include:
  - The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent safely practicable resulting in reduced habitat disturbance and noise propagation.
  - Much of the proposed Project Footprint will be developed within previously disturbed areas, including roads currently used for exploration activities, thereby minimizing additional habitat disturbance.
  - During Operation, progressive reclamation will be completed where possible, and the progress and success of these activities will be assessed annually.
- **Pre- disturbance wildlife clearance surveys will be conducted to identify site-specific habitat features (e.g., amphibian breeding ponds) and implement the setbacks and/or timing windows (that will be defined in the Wildlife Management Plan).**
- **Locations of site-specific habitat features used by amphibians will be communicated to Project personnel and the requirement to limit disturbance in these areas will be implemented.**
- **Appropriate setback and buffer distances from wetland features where amphibians are known to occur will be implemented and maintained under the direction of a wildlife QP.**
- **Vehicle traffic and construction activities will be restricted to the approved access routes and work areas and will not cross or enter a watercourse or wetland.**

## Bat Species

- Vegetation clearing activities will occur outside of roosting periods, when practical.
- **Pre- disturbance wildlife clearance surveys will be completed to identify site-specific habitat features such as maternal roosting sites and hibernacula used by bat species. If features are identified in the Project Footprint, appropriate setbacks and/or timing windows will be implemented in accordance with the SARGSS (SK MOE 2017 (that will also be defined in the Wildlife Management Plan).**

- In the event a maternal roosting site is identified on the Project Footprint, exclusionary methods (e.g., installing a one-way bat exit) will be implemented following the summer maternity roost season. This installation would allow for bats to leave but not the ability to re-enter the roosting site.
- Locations of these site-specific habitat features used by bats will be communicated to the appropriate Project personnel and the requirement to limit disturbance in these areas will be implemented.
- Specific exclusion methods will be added as mitigation measures (Section 9.4.5 of the final EIS) to prevent access to buildings and other infrastructure.

## Avian Species

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the nesting season, when practical. The breeding and nesting season for most avian species in Saskatchewan typically spans a period from March 15 to August 31; however, the dates differ for certain species.
- In the event Project activities such as vegetation clearing and/or soil disturbance are required during the breeding and nesting season, pre-disturbance wildlife clearance surveys will be conducted by a QP at that location within the Project Area before activities commence to identify the presence of avian SAR and/or their nests.
- Active and/or suspected breeding and roosting locations identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with regulatory guidelines (e.g., the 2017 SARGSS [SK MOE 2017]) for other grebe species (as there is currently no activity restriction guidelines for horned grebe in Saskatchewan) in accordance with the level of the disturbance and species until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations).
- Locations of nesting sites used by bank swallows, barn swallows, and horned grebe will be communicated to appropriate Project personnel and the requirement to limit disturbance in these areas will be implemented.
- Deterrents designed to discourage or prevent barn swallows from using buildings and other Project infrastructure have been described in Section 3.2.4 of the EIS.
- Buildings and other Project infrastructure will be designed and maintained to exclude birds (e.g., barn swallows) and bats as much as practical. This would include installing solid barriers (e.g., corner slope panels, wooden panels) or flexible barriers (e.g., netting, tarps or geotextiles) under roof eaves or other exterior surfaces.

## Residual and Cumulative Effects Summary

The approach to assessing residual Project effects on wildlife VCs followed the methodology outlined in Section 5.8 of the EIS, which included a habitat-based approach. For each VC and associated KI, each residual effect was assessed in the context of the Project activities that will occur within each Project phase. Each residual effect was then characterized based on the combined predicted residual effect for all phases. See Sections 9.3.6 and 9.4.6 of the EIS for specific details regarding the residual effects assessment for wildlife VCs (i.e., residual effect characterization and significance determination). A summary of the environmental assessment considerations and determination for predicted residual effects for Wildlife SAR is provided in Table 0.1. Mitigation measures specific to the Wildlife SAR that were not included or that were revised from what was described in the draft EIS are provided in bold text. These will be added to the final EIS.

The cumulative effects assessment (CEA) followed standard methodology as per provincial (e.g., Guidelines for an Environmental Assessment under the [Saskatchewan] *Environmental Assessment Act* 1980) and federal (e.g., Assessing Cumulative Environmental Effects under the *Canadian Environmental Assessment Act 2012*) guidance, and is discussed in detail in Section 5.9 of the EIS. Similar to the residual effects assessment, the CEA included a habitat-based approach. See Sections 9.3.7 and 9.4.7 of the EIS for specific details regarding the CEA for wildlife VCs. A summary of the significance determination of the cumulative effects on Wildlife SAR is provided in Table 0.2.

**Table 0.1 Summary of the Environmental Assessment Considerations and Determination for Predicted Residual Effects for Wildlife Species At Risk**

Component	Wildlife SAR	Measurable Parameters	Project Activities Resulting in Primary Interactions	Project Phase	Species-Specific Mitigation Measures <sup>1</sup>	Predicted Residual Effect	Significance
<b>Terrestrial Environment</b>	Nine-spotted lady beetle Transverse lady beetle Yellow-banded bumble bee	Amount of habitat that is altered or lost relative to its availability in the Terrestrial Regional Study Area (RSA).	<ul style="list-style-type: none"> <li>Development of access roads and air strip.</li> <li>Site preparation and earthworks; clearing, levelling, and grading of the Project Area.</li> <li>Waste management (composting, domestic and industrial landfill operation, recycling).</li> <li>Water management (including treatment).</li> <li>Surface water withdrawal.</li> <li>On-site and off-site operation of vehicles and transport of materials.</li> <li>Air transportation for workers.</li> </ul>	Construction	<ul style="list-style-type: none"> <li>The proposed mitigation measures outlined in the EIS, particularly those designed for the Valued Components (VCs) Soil and Organic Matter / Peat (Section 9.1.5) and Vegetation and Ecosystems (Section 9.2.5), adequately and appropriately address potential for adverse effects on these species, primarily related to limiting the loss and/or disruption of suitable habitat. These include the following: <ul style="list-style-type: none"> <li>The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent safely practicable resulting in reduced habitat disturbance and noise propagation.</li> <li>Much of the proposed Project Footprint will be developed within</li> </ul> </li> </ul>	Alteration and/or loss of habitat: predicted to be low magnitude, local geographical extent, long-term duration, frequent, and fully reversible.	Not Significant: the predicted residual effect of alteration and/or loss of habitat is not expected to alter the integrity of the habitat for the arthropod SAR within the Terrestrial RSA to the point where it is not sustainable or available to contribute to ecological functions.
			<ul style="list-style-type: none"> <li>Water withdrawal from groundwater or surface water body.</li> <li>Management of surface water (including seepage and site runoff).</li> <li>Water release to groundwater and/or surface water body.</li> <li>On-site and off-site operation of vehicles and transport of materials.</li> <li>Air transportation for workers.</li> </ul>	Operation

## Attachment IR-174 (Round 4):

To address this Round 4 IR, a series of 16 maps are provided in this attachment. There are 4 different life stages shown (i.e., forage habitat potential, overwinter hibernacula potential, maternity roost habitat potential, and summer roost habitat potential) for each bat species (little brown myotis and northern myotis) with both the 1) Project footprint and 2) project footprint plus 500 m buffer. The following list summarizes the map numbers and content:

- Northern Myotis Summer Roost Habitat Potential within the...
  - Figure 15: Wildlife Study Areas
  - Figure 16: Wildlife Study Areas (with 500m disturbance buffer shown)

The rationale for each of the 4 life stages is provided below.

### Foraging habitat:

Based on information in Appendix 9-D, both species of bats could potentially forage anywhere and as such, all ecosites were shown as providing potential foraging habitat in Figures 1 to 4.

#### Overwinter hibernacula habitat:

As noted in Appendix 9-D, hibernacula occur in parts of caves, mines (openings to surface for ramps and raises for example), and buildings that have stable and specific temperature (-4 to 13°C) and humidity (>80%) conditions (COSEWIC 2013). Based on existing environment information presented in the EIS including the terrain and vegetation and ecosystem existing environment sections, there are no caves anticipated in the wildlife study areas. Terrain is low relief due to flat-lying sandstone and almost continuous cover of sandy glacial deposits (i.e., surface is predominately sand textured and there are no rocky outcrops or bedrock at surface for cave habitats). There are no mine openings in the wildlife study areas. We do note that there are buildings in the wildlife study areas are Denison's exploration camp which is located out of the Project Area; this area is shown as providing overwinter hibernacula habitat potential in Figures 5 to 8.

#### Maternity roost habitat:

Maternity sites can occur in large-diameter trees, rock crevices, buildings, and bat houses that offer warm and relatively stable microclimate conditions that allow females to avoid going into torpor so they can focus on caring for their young (COSEWIC 2013, Slough and Jung 2020). The only buildings in the wildlife study area are buildings at Denison's existing exploration camp, which are outside of the Project Area. There are no known bat houses in the wildlife study areas. An evaluation of maternal roost potential in trees was focused on the areas where larger diameter trees may be present. Existing ecosite information was reviewed and ecosites with higher potential for maternity roosts (i.e., larger diameter trees) were selected. The ecosites with the potential for larger diameter trees are shown in Figures 9, 10, 11, and 12 below, and include ecosites RF1 (regenerating forest >5m tall; per Appendix 9-B), BS3 jack pine/blueberry/lichen, BS4 jack pine – black spruce/feathermoss, BS7 black spruce/blueberry/lichen, BS9 black spruce – jack pine/feathermoss, BS14 white birch/lingonberry – labrador tea, BS16 black spruce/ balsam poplar/river alder swamp, BS17 black spruce treed bog, and BS21 tamarack treed fen. While these ecosites were selected for the potential to have larger diameter trees, it is important to note that the majority of these ecosites have trees with diameter at breast height <10 cm. Refer Appendix 9-B for representative photos of the selected ecosites.

#### Summer roost habitat potential:

Little Brown Myotis: Males are more versatile in their summer roosting requirements and use tree cavities, raised bark, foliage, rock crevices, buildings, and bridges with a broader range of microclimate conditions (COSEWIC 2013a, Johnson et al. 2019).

Northern Myotis: Summer roosting trees are typically found in mature to old-growth forests, swamps, and riparian areas, although retained older trees and snags in younger forests may occasionally provide suitable roosting habitat (Environment and Climate Change Canada 2018).

Considering the above information, Figures 13 to 16 show ecosites with trees and the existing exploration camp (i.e., buildings). The rationale is that in the summer bats can roost anywhere there are trees. As such, ecosites where trees are not expected are not included in the summer roost habitat potential (e.g., waterbodies, bogs, fens with the exception of BS21 tamarack treed fen are not included in Figures 13 to 16).

## 1 Introduction

On October 21, 2022, Denison Mines Corp. (Denison) submitted a draft Environmental Impact Statement (EIS) for the proposed Wheeler River Project (the Project). Based on their initial review, the Canadian Nuclear Safety Commission indicated that the submission contained the required information to proceed with the Federal-Indigenous Review Team (FIRT) technical review of the draft EIS. On March 20, 2023, the FIRT provided Denison with an initial list of information requests (IRs) for Denison to respond to and eventually submit a final EIS document. Denison compiled a list of responses to these initial IRs and provided the FIRT with a revised draft on August 18, 2023. Following the review of these documents, the FIRT provided Denison with a subsequent list of IRs on November 27, 2023. This Appendix provides additional information to address several IRs provided by Environment and Climate Change Canada (ECCC) related to woodland caribou, migratory songbird species, and species at risk (SAR) listed under Schedule 1 of the federal *Species at Risk Act* (SARA).

## 2 Supplemental Information

### 2.1 Woodland Caribou

The following information is intended to provide additional context to the responses provided in the IR tracking sheet, particularly in regard to the following: IR-137, IR-143, IR 144, IR 145, IR-143/144R1, IR-143/145R1, IR-149, IR-149-R1A and R1B, IR-151, IR-155, and IR-156.

Figure 2-1 illustrates the location of woodland caribou observed during the baseline field program in association with the ecosite types as classified by the Saskatchewan Ministry of Environment as having the potential to develop into low, moderate, or high-quality habitat to support woodland caribou in relation to the SK1 range. These habitat potential categories are based on the overall habitat suitability ranking for the life history requirements, including forage, refuge, and calving habitat for caribou (Saskatchewan Ministry of Environment 2019). Figure 2-2 provides further insight as to the woodland caribou observed during the baseline field program in association with the ecosite types as classified by the Saskatchewan Ministry of Environment but in context with the Wildlife Study Areas.

To provide further context on the biophysical attributes for woodland caribou, as referenced in the 2020 Amended Recovery Strategy for the Woodland Caribou (*Rangifer tarandus caribou*), Boreal Population, in Canada (ECCC 2020), Figure 2-3 to Figure 2-8 illustrate the location of caribou observations from the baseline field program in relation to calving, foraging, and refuge habitat, based on information received from the Saskatchewan Ministry of Environment (2023). These figures present the information at two different scales: (1) in context with the Wildlife Study Areas, and (2) in relation to the Project Footprint.

**Figure 2-8: Caribou Refuge Habitat Potential within the Project Footprint**

## 2.2 Migratory Birds

The following information is intended to provide additional context to the responses provided in the IR tracking sheet, particularly in regard to the following: IR-159 and IR-162. For IR-160, IR-164, IR-169, and IR-170, the updates were made in Section 9 of the EIS.

Number	IR-159_WRP
Dept.	ECCC
Project effects link	Migratory Birds
Reference to EIS, appendices, or supporting documentation	9.4.3.2.3 Baseline Studies – Migratory Songbirds Appendix 9-B, Section 2.10.2, Results
Context and Rationale	<p><b>Context and Rationale:</b> Information presented in the draft EIS is insufficient to accurately predict Project impacts to breeding birds. The Proponent collected a single year of breeding songbird point counts and aerial waterfowl surveys (including avian species at risk). A single year of surveys in which birds may be unusually scarce or abundant could severely compromise interpretation of post- construction monitoring data.</p> <p>Additionally, data presented in the draft EIS is from 2017 and ECCC advises that more recent data is needed for a comprehensive baseline to verify Project impacts.</p> <p>Data from the Saskatchewan Conservation Data Centre (HABISask), the Saskatchewan Breeding Bird Atlas and the Boreal avian Modelling project contain information on avian densities and avian species at risk that could supplement field data.</p> <p>The national standard for major projects recommends a minimum of two years of field surveys to be provided, so that temporal variability can be considered when comparing post-construction against baseline records and other available data.</p> <p><b>Updated Rationale:</b> ECCC recommends that for major projects, a minimum of two years of field surveys should be provided so that temporal variability can be considered when comparing post-construction against baseline records and other available data. More recent data is needed.</p> <p>due to landscape changes that may have occurred since 2017 as well as cumulative effects that have occurred in that time. Additionally, if there was an unusually high population density of birds in 2017 due to extraneous circumstances, Project effects may be attributed to a non-existent decline in the population when the discrepancy can be due to natural variability.</p> <p>A more recent baseline will account for interannual variation and any regional effects and will allow for a more accurate review of mitigation and follow-up measures. Data from the Saskatchewan Conservation Data Centre (HABISask), the Saskatchewan Breeding Bird Atlas and the Boreal Avian Modelling project contain information on avian densities and avian species at risk that could supplement field data.</p>
Information Requirement	Supplement breeding bird point count data and aerial waterfowl data collected during 2017 with additional pre-construction field data or existing post-2017 data/modelling to provide a comprehensive baseline that can be used to verify Project impacts during construction and operational phases.

**Response:**

The EA used an accepted, proven habitat-based EA approach to address the variability of population surveys. Further, the EA used all available, recent/relevant survey data collected in appropriately timed and executed methodologies, including TK. However, supplemental surveys would not be expected to provide any information/data that would affect or alter the findings of the habitat-based EA.

The supplemental avian data received from records from the Saskatchewan Breeding Bird Atlas downloaded through the NatureCounts web portal (Saskatchewan Breeding Bird Atlas 2017), which also includes data received as part of the Saskatchewan Boreal Monitoring Strategy program. These data represent bird observations from 24-point counts conducted on June 7 and June 9, 2019. Nine point-counts are located approximately 6.5 km east of the Project footprint, the majority of which are located in the BS3 ecosite type; 15 point-counts are located approximately 7.7 km south of the Project footprint, the majority of which are located in the BS3/BS7 ecosite type. During this survey effort, 24 migratory songbird species were documented. A summary of the total number of individuals observed for each species across all plots are presented below.

Common Name	Scientific Name	Number of Individuals Observed
American Robin	<i>Turdus migratorius</i>	8
Bald Eagle	<i>Haliaeetus leucocephalus</i>	1
Canada Goose	<i>Branta canadensis</i>	50
Canada Jay	<i>Perisoreus canadensis</i>	10
Chipping Sparrow	<i>Spizella passerina</i>	19
Common Loon	<i>Gavia immer</i>	2
Common Tern	<i>Sterna hirundo</i>	1
Dark-eyed Junco	<i>Junco hyemalis</i>	10
Greater Yellowlegs	<i>Tringa melanoleuca</i>	1
Hermit Thrush	<i>Catharus guttatus</i>	11
Lincoln's Sparrow	<i>Melospiza lincolni</i>	8
Orange-crowned Warbler	<i>Leiothlypis celata</i>	2
Palm Warbler	<i>Setophaga palmarum</i>	10
Red-breasted Merganser	<i>Mergus serrator</i>	2
Ruby-crowned Kinglet	<i>Corthylio calendula</i>	14
Savannah Sparrow	<i>Passerculus sandwichensis</i>	1
Solitary Sandpiper	<i>Tringa solitaria</i>	0
Song Sparrow	<i>Melospiza melodia</i>	2
Spotted Sandpiper	<i>Actitis macularius</i>	1

Common Name	Scientific Name	Number of Individuals Observed
White-crowned Sparrow	<i>Zonotrichia leucophrys</i>	6
White-throated Sparrow	<i>Zonotrichia albicollis</i>	24
White-winged Crossbill	<i>Loxia leucoptera</i>	40
Yellow Warbler	<i>Setophaga petechia</i>	3
Yellow-rumped Warbler	<i>Setophaga coronata</i>	12

Number	IR-162_WRP
Dept.	ECCC
Project effects link	Migratory birds
Reference to EIS, appendices, or supporting documentation	Section 9.4.3.3, Bird Species at Risk
Context and Rationale	<p><b>Context and Rationale:</b> Not all avian species at risk present in the study area were included as Key Indicators in the avian species at risk (SAR) valued component (VC). Barn swallow and horned grebe were recorded in the study area, but not included as VCs. Additionally, bank swallow may inhabit the Project area. Impacts to Species at Risk Act Schedule 1 listed species need to be identified, avoided, lessened and monitored.</p> <p>In Section 9.4.3.3. the Proponent states:</p> <p>“It is acknowledged that the listed Barn Swallow (<i>Hirundo rustica</i>) and Horned Grebe (<i>Podiceps auratus</i>) could potentially occur in the Terrestrial RSA. Incidental observations occurred during the baseline studies (Appendix 9-B). To focus the effects assessment on a few key species (described in the following) it was decided to use Olive-sided Flycatcher and Common Nighthawk to represent Barn Swallow as well, and to use Yellow Rail and Rusty Blackbird as a substitute for Horned Grebe. Unlike Horned Grebe, Yellow Rail and Rusty Blackbird are also listed provincially.”</p> <p>Barn swallow, bank swallow and horned grebe may have different nesting habitat requirements than the representative species discussed in the draft EIS. An explanation of how differing species are representative of one another is required, or if an explanation cannot be provided, the species should be assessed individually.</p> <p><b>Updated Rationale:</b> The management plans for these three species demonstrate the variability in their habitat selection.</p> <p>The Management Plan for the Yellow Rail (<i>Coturnicops noveboracensis</i>) in Canada (Environment Canada, 2013) states “Yellow Rails inhabit shallow wetlands and other wet areas with grass-like vegetation. They breed in wetlands such as damp hay fields or meadows, floodplains, bogs, upper levels of estuaries, salt marshes (Bookhout 1995, Alvo and Robert</p>

	<p>1999, COSEWIC 2009), shallow prairie wetlands, and wet montane meadows (Peabody 1922, Sherrington 1994, Popper and Stern 2000). “</p> <p>The Management Plan for the Rusty blackbird (<i>Euphagus carolinus</i>) in Canada (Environment Canada 2015), states: “Rusty Blackbirds tend to select breeding sites with a combination of freshwater bodies with shallow water and emergent vegetation for foraging that are adjacent to wetlands with conifers or tall shrubs with cover for nesting (Matsuoka et al. 2010a, Matsuoka et al. 2010b, Greenberg et al. 2011).”</p> <p>The Management Plan for the Horned Grebe (<i>Podiceps auritus</i>), Western population, in Canada (ECCC, 2022) states: “The Horned Grebe breeds in small (generally 0.5 to 2 ha, but ranging from 0.24 to 18.2 ha), shallow (at least 20 cm deep, but on average 40 cm), and usually fishless, perennial wetlands, but they can also nest on larger lakes with shallow edges and sufficient emergent vegetation. Breeding sites usually contain at least 40% open water with beds of emergent vegetation, such as sedges (<i>Carex</i> spp.), rushes (<i>Juncus</i> spp.) and cattails (<i>Typha</i> spp.) (Faaborg 1976, Kuczynski et al. 2012, Routhier 2012, Stedman 2018).”</p> <p>Due to differing habitat selection and use, ECCC recommends that each selected VC is given an individual assessment with specific mitigation measures. This will allow for a more accurate review of the chosen mitigation measures.</p>
Information Requirement	<p>Explain how nesting habitat requirements of barn swallow is represented by common nighthawk and olive-sided flycatcher as a VC or assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>Explain how nesting habitat requirements of horned grebe are represented by yellow rail and rusty blackbird as a VC, or assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>Assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>See also related IRs: IR-160 and IR-161.</p>

#### **Response:**

As per accepted, proven EA methodology, Denison used a habitat-based methodology to determine the Project’s effects on VCs, using an accepted Key Indicator methodology, and not every species, to focus and inform the EA.

Nesting habitat requirements of the horned grebe are similar at a landscape level to those represented by yellow rail and rusty blackbird in that they are typically found associated with northern waterbodies and watercourses with various forms of emergent vegetation. At a site-specific scale, there are subtle differences in nesting habitat requirements, as summarized previously by ECCC in the Context and Rationale response.

Given the nesting habitat requirements of these species, the available habitat types within the Denison study areas (e.g., Project Area, Wildlife Local Study Area, and the Terrestrial Regional Study Area) for use by these species include the following ecosite types: Labrador tea shrubby bog (BS18), graminoid bog (BS 19), graminoid bog/graminoid fen (BS19/BS24), open bog (BS 20), leatherleaf shrubby poor fen (BS22), willow shrubby rich fen (BS23), graminoid fen (BS24), open fen (BS25), and waterbodies and lakes. The habitat-based methodology of the environmental assessment adequately and appropriately addresses effects on these habitat types and the associated migratory bird species that could potentially use these

habitat types. Further assessment of each species would not be expected to affect or alter the findings of the habitat-based environmental assessment.

The characterization of the alteration and/or habitat loss residual effect considers the Project effects on available habitat used by these three migratory breeding birds within the Wildlife LSA and Terrestrial RSA. As outlined in Table 9.3-18, 0.05% of the Project Area, 11.5% of the Wildlife LSA, and 24.2% of the Terrestrial RSA provide habitat types that are potentially available to these three migratory breeding bird species.

Direct habitat loss is calculated as the area of available habitat lost due to site clearing within the Project Area. Direct habitat loss has been mitigated by reducing the size of the Project Area to the extent practicable during Project design; however, available habitat is still predicted to be cleared during Construction. In the Project Area, 0.09 ha or 100% of available habitat is assumed to be removed and will not be available to these species for the duration of the Project (Table 9.3-19). This considers that the Project Area has previously been disturbed (i.e., almost 15% of the Project Area is disturbed by anthropogenic activities) and includes only 0.02 ha (0.01%) of landscape covered by waterbodies. This relates to a removal of 0.02% of available habitat within the Wildlife LSA and 0.001% in the Terrestrial RSA.

An additional 93.9 ha (17.0%) of available habitat in the Wildlife LSA may experience habitat alteration resulting from indirect Project effects, such as sensory disturbance (Table 9.3-19). This area of indirect effect represents 1.0% of available habitat in the Terrestrial RSA that may experience habitat alteration.

### 2.3 Species At Risk – *Myotis* Species

The following information is intended to provide additional context to the responses provided in the IR responses to for IR-174 associated with both the Round 2 and Round 3 responses.

Acoustic bat surveys were completed between July 22 and 23, 2019 with 61 survey points sampled across five ecosite types (refer to Appendix 9-B). The location of the survey points, species detected, and frequency of detections are included in Figure 2-9.

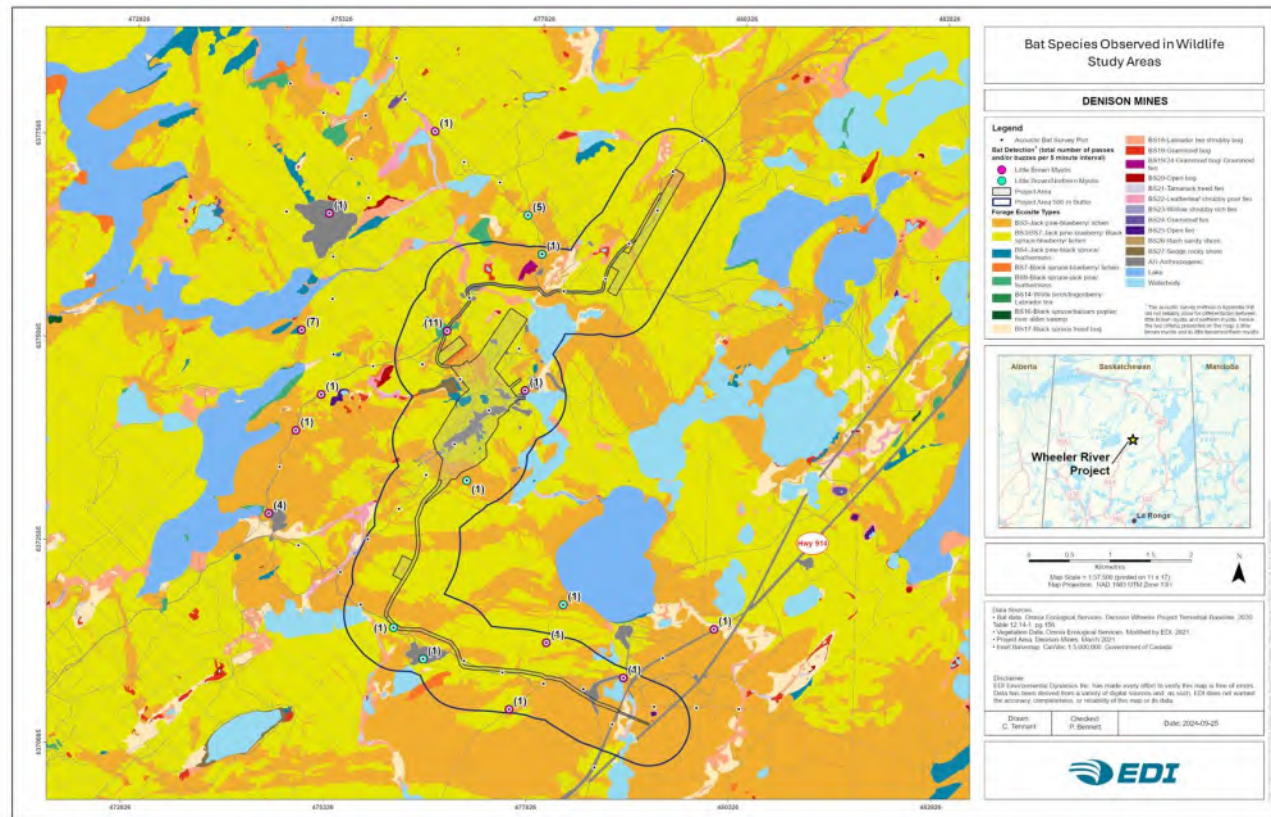

As noted in Appendix 9-D, habitat for the little brown myotis is composed of (1) overwintering hibernacula that are sufficiently cool and humid and (2) summering areas that provide foraging areas and suitable locations for roosting and maternity colonies (COSEWIC 2013). Hibernacula and maternity sites are reported as being the main limiting habitat features for this species (COSEWIC 2013), and this, as described below, is consistent with conditions at the Project site and surrounding area.

Hibernacula occur in parts of caves, mines (openings to surface for ramps and raises for example), and buildings that have stable and specific temperature (~4 to 13°C) and humidity (>80%) conditions (COSEWIC 2013). Based on existing environment information presented in the EIS including the terrain and vegetation and ecosystem existing environment sections, there are no hibernacula anticipated in the Project Area (i.e., caves, mines, buildings with stable and specific temperatures per COSEWIC 2013). Terrain is low relief due to flat-lying sandstone and almost continuous cover of sandy glacial deposits (i.e., surface is predominately sand textured and there are no rocky outcrops or bedrock at surface for cave habitats); there are no man-made structures (e.g., mine openings or buildings) in the Project Area. As noted in the EIS, the terrain and vegetation communities are fairly uniform throughout the study areas and the habitat considerations in the Project Area are considered representative of the landscape in the wildlife LSA and RSA.

Maternity sites can occur in large-diameter trees, rock crevices, buildings, and bat houses that offer warm and relatively stable microclimate conditions that allow females to avoid going into torpor so they can focus on caring for their young (COSEWIC 2013a, Slough and Jung 2020). As highlighted above, since there are no rock crevices, buildings, or bat houses in the Project Area, a consideration for maternal roost potential was focused on the areas where larger diameter trees may be present.

Existing ecosite information was reviewed and ecosites with higher potential for maternity roosts (i.e., larger diameter trees) were selected. The ecosites with the potential for larger diameter trees are shown in Figure 2-10 below, and include ecosites RF1 (regenerating forest >5m tall; per Appendix 9-B), BS3 jack pine/blueberry/lichen, BS4 jack pine – black spruce/feathermoss, BS7 black spruce/blueberry/lichen, BS9 black spruce – jack pine/feathermoss, BS14 white birch/lingonberry – labrador tea, BS16 black spruce/balsam poplar/river alder swamp, BS17 black spruce treed bog, and BS21 tamarack treed fen. While these ecosites were selected for the *potential* to have larger diameter trees, it is important to note that the majority of these ecosites have trees with diameter at breast height <10 cm. Refer to Appendix 9-B for representative photos of the selected ecosites.

Based on this conservative mapping exercise, the Project Area contains small areas of suitable potential maternal roost habitat. The total Project Area is around 170 ha and potential bat maternal roost ecosites represent less than 49 ha, when as noted above it is assumed that the ecosites identified above provide trees suitable for maternity roosts across their entirety. As noted in the EIS, the terrain and vegetation communities are fairly uniform throughout the study areas and the habitat considerations in the Project Area are considered representative of the landscape in the wildlife LSA and RSA.

Annex 7

**Federal Indigenous Review Team (FIRT) – Advice to the Proponent for the Wheeler River Environmental Impact Statement (EIS) October 2024**

**\*\***The [March 2023 Advice to the Proponent table](#) and [November 2023 Advice to the Proponent table](#) with Denison’s responses are available below

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response October 24, 2024
AD-72	CNSC	Section 8.1.3.4.2 Probable Maximum Precipitation (PMP) Events  Appendix 8C	In Section (List of Appendices, p. iv) of “S8_App 8-C Hydrological Effects Assessment Report Wheeler River” states “Appendix III- Response to IR-103”. This is incorrect and refers to IR-103.	This reference should be edited to “Appendix III- Response to IR-102.”	This has been corrected in the final EIS.
AD-73	Environment and Climate Change Canada (ECCC)	Section 2.2.3 Project Description Proponent response to IR-12-R1B	The Proponent provided maps of the proposed water management structures for the road to the airstrip and the airstrip in Attachment IR-12. However, they should commit to including them in the Final EIS. Inclusion of these maps will allow for improved understanding of site water management and transportation of non-contact water.	ECCC recommends that the Proponent Include maps of the proposed water management structures for the road to the airstrip and the air strip, provided in Attachment IR-12, in the Final EIS.	Thank you for the advice comment. The information used to address the IRs associated with proposed site water management is extracted from the most current engineering design documents which will be further refined as the Project progresses through construction. Denison provides engineering design documents to the Province of Saskatchewan as part of the provincial permitting process. The engineering documents associated with the site water management plan become the single source of information as part of Denison’s Quality Management System. Denison will adhere to all site water management commitments outlined in the EIS, including any commitments listed within the IR responses.
AD-74	ECCC	Section 8 (Aquatic Environment); Appendix 10-A (ERA)	The predicted effluent concentration of 42 ug/L for the proposed Project represents a very high concentration of selenium. For comparison, the Canadian Council of Ministers of the Environment (CCME) guideline is 1 ug/L ( <a href="#">January, 2022: Proposed Approach for Coal Mining Effluent Regulations – Discussion Document (canada.ca)</a> )	Given the high selenium concentrations predicted in the discharge, ECCC recommends that the Proponent: <ul style="list-style-type: none"><li>Identifies effective mitigation measures (including source control) to avoid effects in the receiving environment, and</li><li>Analyzes the extent to which selenium concentrations in effluent can be reduced.</li></ul>	Proposed effluent release to the environment starts at Operation phase and BATEA information will come with the application for the license to operate. Denison commits to following the guidance and requirements of REGDOC-2.9.2 to develop effluent discharge targets as per operational licensing and in consultation with the CNSC.
AD-75	ECCC	Section 2.2.3 Project Description Proponent response to IR-12	While the Proponent did provide in Attachment IR-12 the requested proposed water management structures, for the road to airstrip and the airstrip, the information surrounding the proposed water management structures is found within multiple documents which makes it difficult for readers to understand the resulting impacts to water quality.	The proposed water management structures for the road to airstrip and the airstrip should be included in the Final EIS to allow for the effects of these structures to be more readily understandable. Additionally, the Proponent should respond to questions within a single document to reduce the complexity involved in understanding the environmental effects of the Project.	Thank you for the advice comment. The information used to address the IRs associated with proposed site water management is extracted from the most current engineering design documents which will be further refined as the Project progresses through construction. Denison provides engineering design documents to the Province of Saskatchewan as part of the provincial permitting process. The engineering documents associated with the site water management plan become the single source of information as part of Denison’s Quality Management System. Denison will adhere to all site water management commitments outlined in

<sup>1</sup> Unless otherwise stated, the section noted refers to the draft EIS

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response October 24, 2024
					the EIS, including any commitments listed within the IR responses.
AD-76	ECCC	Section 8.4.4.2.3, Aquatic Environment IR-124-R1 Response from Denison	CSA N288.6-22 is the latest standard for the nuclear industry for the assessment of risk associated with releases from the nuclear industry to the environment. The statistical and environmental considerations required in the establishment of baseline data as well as the use of mathematical models are set out in the standard to ensure that the risk assessments are defensible.	The Proponent should apply CSA N288.6-22 to risk assessment for sediment where appropriate.	CSA N288 guidance documents are used in an integrated manner and Denison is confident the standards have been used appropriately.
AD-77	ECCC	Section 9.3.3.3, Baseline Studies Section 9.3.5 Mitigation Measures IR 142, 159, and 167 Responses from Denison  IR-142-159-167-R1 IR-170	<p>It is unclear how conducting wildlife sweeps seven days in advance will adequately identify and mitigate for all species, especially species at risk. Similarly, uncertainty remains regarding how adaptive management mechanisms will be triggered.</p> <p>Note that active terrestrial nest searches for birds, including avian species at risk, are generally not recommended by ECCC or the province of Saskatchewan (<a href="https://publications.saskatchewan.ca">Publications Centre (saskatchewan.ca)</a>) because they are likely to cause disruption to breeding activities and are largely ineffective for passerines.</p> <p>However, if avian nest searches in simple habitats (as outlined in the <a href="#">Guidelines to avoid harm to migratory birds</a>) are undertaken, then information should be provided on methods and timing for review. Conducting a nest search seven days in advance of works may be too far in advance to detect all possible nests. Nest searches should be conducted as close to the clearing or construction dates as possible. Developing species specific mitigation measures based on habitat potential mapping, prior to nest searches, can reduce construction delays, as advice on these measures would be available for implementation.</p> <p>For certain projects or locations, additional more specialized surveys may be warranted (e.g., radar surveys, or foot-based counts of colonially nesting birds).</p>	The Proponent should develop species specific mitigation measures, and provide these for review. Species specific mitigations should take into account the ecology of individual species at risk, including habitat requirements, nesting/denning or other important landscape features and timing of life stages as they relate to project construction and operation. The Proponent should conduct literature reviews to find proven mitigations for all species at risk within the project area. ECCC is available to discuss these measures with the Proponent.	Please see response to IR-142, IR-159, IR-167-R1 (Round 3).
AD-78	ECCC	Section 9.3.6.4 IR-149-R1B	In their IR response, the Proponent states “English River First Nation and SVS (2022) compiled an IK study documenting current and past land use, knowledge of the land, and participants’ perspectives on potential Project effects, as well as cumulative effects from past mining and other developments. The report identified a wildlife corridor used by several species, including woodland caribou. The corridor runs between Cree Lake (approximately 40km southwest of the Terrestrial RSA and Russell Lake (in the southern portion of the Terrestrial RSA (Feature 1001-09; ERFN and SVS 2022)). The report identified a caribou calving area: Feature 1009-07 covering large portions of the Terrestrial RSA with the exception of the most western, northern, and eastern extents. This area is also described as offering good caribou habitat year-round (ERFN and SVS 2022).”	Since both the mapping provided as part of the EIS and the English River First Nation study indicates that there is calving areas within the RSA, incorporating mitigation measures related to timing of sensory disturbances during calving season into the Caribou Management Framework would enhance the caribou management plan.	See response to IR-149-R1B (Round 3) and commitment 9-36 (in Denison’s Commitments Register, version 3). Additional detail will also be documented as the EMS documentation evolves.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response October 24, 2024
			<p>The Proponent has also provided mapping showing that there are calving areas within the RSA.</p> <p>Calving is an important life history function that occurs within specific biophysical attributes. It is important to mitigate these effects.</p>		
AD-79	ECCC	Section 9.4.1.2, Key Indicators and Measurable Parameters IR-158	The Proponent identified key indicator species for migratory songbirds, waterbirds and upland game birds, but did not provide any justification on why these species were chosen. It is important to understand why a certain species was chosen as an indicator in order to assess whether the that species possesses similar life history characteristics.	<p>During pre-construction, construction and operational monitoring, the Proponent should consider any trends and changes to the avian community, including the key indicator species which are representative of other species that may be more difficult to monitor for implementation of adaptive management. (see IR-159 for additional input).</p> <p>Appendix 9-D provides an assessment of three additional key indicator species (Barn Swallow, Bank Swallows, Horned Grebe). All eight key indicators for avian species at risk should be accounted for.</p>	As outlined in the EIS, monitoring programs specific to avian species include routine monitoring / observations throughout the life of the Project in accordance with the EMS. This will include observations of any bird species, including the bird species at risk.
AD-80	ECCC	9.4.3.2.3 Baseline Studies – Migratory Songbirds Appendix 9-B, Section 2.10.2, Results IR-159	Although the Proponent notes that the supplemental data did not result in a different conclusion in the EIS and would not require updates to the mitigation measures, it was acknowledged that the data did provide further context for the RSA. Interpreting the original baseline data as well as the supplemental data in the context of the Project (i.e. what species were at what densities in which areas/ecosites) provides a more robust baseline with which to compare construction and operational monitoring data. This is particularly important in the context of species’ natural variability.	Even if the supplemental data did not change the conclusions in the EIS, the data is essential for comparison reasons. Data collected during construction and operational monitoring should be compared with baseline data to test predications on impacts from the project, and whether mitigation measures are effective.	Thank you for the advice comment. The information contained in the IR comment and response process is part of the federal record. As outlined in the EIS, monitoring programs specific to avian species include routine monitoring /observations throughout the life of the Project in accordance with the EMS. This will include observations of any bird species, including the bird species at risk.
AD-81	ECCC	Section 9.3.3.3, Baseline Studies IR-143 and 144 Responses from the Proponent	<p>In their IR response, the Proponent notes that “the majority of these data points illustrated in Figure 2-2 and Figure 2-3 in revised draft EIS Appendix 9-F are located beyond the LSA and to the north and east of the Project Area.”</p> <p>ECCC notes that the baseline studies done for the Project were limited in scope and scale, and the map showing telemetry data from the province of Saskatchewan shows caribou use throughout the LSA and RSA.</p> <p>ECCC notes that trail camera, pellet, incidental and telemetry data only provide a small snapshot of actual habitat use.</p>	ECCC advises that the Caribou Management Framework should consider the entire LSA as being used by caribou for all their life functions and that mitigation measures, including offsetting, be developed with the understanding that this Project poses a medium level risk to caribou using the area.	<p>While the response to the round 2 IR-143 and IR-144 did explain baseline caribou observations to address ECCC’s comments, it is important to note that the EIS assumed caribou to be present in the study areas throughout all seasons and life stages. Denison has committed to offsetting with SK ENV (see commitment 9-35 in Denison’s Commitments Register, version 2).</p> <p>The advice comment from ECCC notes the project poses a “medium risk” to caribou but this is not consistent with the conclusions of the EIS and is not aligned with assessment approach framework (refer to Section 5 of the EIS for the approach and methodology of the assessment).</p>
AD-82	ECCC	Section 9.3.3.3, Baseline Studies IR-149-R1A IR-152.	ECCC notes that the Proponent indicates a commitment to continuing to work with the province regarding caribou offsetting through the finalization of the Caribou Management Framework.	ECCC notes that at this time there are not enough details in the Caribou Management Framework for ECCC to provide advice on the appropriateness of the offsetting measures.	Denison’s EIS has concluded there are no significant effects on caribou; this conclusion is not reliant on habitat offsetting as a mitigation measure. Denison has provided the appropriate level of information for the purposes of EA review and has committed to offsetting with SK ENV (see commitment 9-35 in Denison’s Commitments Register, version 3).

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response October 24, 2024
AD-83	ECCC	Section 9.3.5.2, Additional Wildlife specific Mitigation Measures Proponent response to IR-149	<p>ECCC notes that Figure 2.4 of Appendix 9-F, shows that there is suitable calving habitat in close proximity to the airstrip, including within the LSA just west of the airstrip and along the Wheeler River at the southeast end of the LSA. ECCC notes that information is not yet available on the timing and frequency of air traffic.</p> <p>The Proponent has provided some potential measures likely to be incorporated into operations of the airstrip. The Proponent states that they will use the most direct path, however, important areas for caribou (e.g. calving grounds) may be located along the most direct route. Figure 2.4 of Appendix 9-F, shows that there is suitable calving habitat in close proximity to the airstrip, including within the LSA just west of the airstrip and along the Wheeler River at the southeast end of the LSA.</p>	ECCC advises that mitigation and monitoring should be developed to address sensory impacts as a result of the airstrip. The Caribou Management Framework should incorporate consideration of the proximity of air traffic to important landscape features for caribou, as well as timing of flights during important life stages (e.g. calving).	See response to IR-149-R1B (Round 3) and commitment 9-36 (in Denison’s Commitments Register, version 3). Additional detail will also be documented as the EMS documentation evolves.
AD-84	ECCC	Section 9.3.6.4.1 Section 9.3.7.3.1	The Proponent notes that the size of the SK1 Boreal Shield range is estimated at 18,034,870 ha (ECCC 2020), resulting in an estimated additional Project-related disturbance of 0.001% at the scale of the SK1 Boreal Shield Woodland Caribou Management Unit. The Proponent concludes that the contribution of the Project to cumulative effects on woodland caribou within the SK1 conservation unit are negligible.	Although the Proponent has provided information to show that the Project has negligible impacts at range scale, this Project poses a medium risk to caribou at the local and regional scale due to the proximity of important features for caribou within the LSA and RSA. Mitigations for sensory disturbance during critical life stages such as calving should be developed and included within the Caribou Management Framework. Measures to monitor the effectiveness of implementation are also needed.	<p>We note ECCC’s advice comment speaks to the project posing a “medium risk” to caribou at the local and regional scale; importantly, we note that Denison’s EIS has concluded there are no significant effects on caribou per the assessment approach framework (refer to Section 5 of the EIS for the approach and methodology of the assessment).</p> <p>Please also see response to IR-149-R1B (Round 3).</p>
AD-85	ECCC	Section 9.3.5.2 Appendix 9-E Wheeler River Project Caribou Management Framework	<p>Much of the information presented in the Wheeler River Project Caribou Management Framework is qualitative in nature and does not present specific details regarding a quantitative assessment of impacts following measures to avoid, minimize, restore on-site and determine the offset. This is required in order to understand if offsetting is sufficient to address impacts to caribou.</p> <p>The updated Wheeler River Project Caribou Management Framework indicates that the Proponent will use the SK ENV caribou offset calculator. Without information on the amount of offsetting that will be implemented, ECCC cannot advise on whether the amount is appropriate in the context of the species Recovery Strategy.</p> <p>Although the Proponent has provided an updated draft Caribou Management Framework, information regarding offsetting remains outstanding. The Proponent notes that SK ENV is developing a boreal caribou habitat offset calculator and that the Caribou Management Framework will be finalized using that tool as part of the provincial approvals.</p>	<p>Information is still lacking on the amount of habitat offset required to balance against Project effects. Therefore, the Caribou Management Framework should be updated with outstanding information.</p> <p>The Proponent should consider offsetting effects associated with this Project. However, ECCC is unable to specify an offsetting amount at this time as there was insufficient information provided by the Proponent. ECCC acknowledges that the Proponent has committed to working on their offset plan with the province of Saskatchewan. However, offsetting measures, outputs, and priority locations should be confirmed in draft plans and submitted for review. Without additional information on the Proponent’s mitigation measures, including offsetting measures, ECCC cannot provide advice on whether project effects will be mitigated.</p>	<p>Denison’s EIS has concluded there are no significant effects on caribou; this conclusion is not reliant on habitat offsetting as a mitigation measure. Denison has provided the appropriate level of information for the purposes of EA review and has committed to offsetting with SK ENV (see commitment 9-35 in Denison’s Commitments Register, version 2).</p> <p>Please also see Denison’s response to IR-149 (Round 3) and IR-157 (Round 3).</p>

**Federal Indigenous Review Team (FIRT) – Advice to the Proponent for the Wheeler River Environmental Impact Statement (EIS) November 2023**

\*\* The new [newest Advice to Proponent table](#) is available above

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>2</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response
AD-50	ECCC	Section 2.2.1.4.2, Wellfield Operation Section 2.2.1.4.2.2, Secondary Containment of Mining Solution – Pumping	Providing a report or memo by the Proponent’s consultant Newmans Geotechnique Inc. as a public record will more effectively explain the “information on the freeze wall integrity and basis for the design, which relies on site field data and lived experience from several exiting [sic] Saskatchewan mining operations”, than a summary (attachment IR-10) of the material presented by Greg Newman during the meeting with the FIRT on April 19, 2023.	The response from the Proponent in IR-10 is accepted based on the meeting between ECCC, Denison and the CNSC, as well as the Proponent’s consultant and the presentation by Greg Newman (Newmans Geotechnique Inc.) as well as the summary of the meeting noted in attachment IR-10. However, the Proponent should provide a public record of the consultant’s memo or a report that explains the details of the freeze wall containment and monitoring that were provided during the April 19, 2023 meeting instead of the summary provided by the Proponent in attachment IR-10.	The April 19, 2023, presentation from Newmans Geotechnique Inc. to the CNSC is provided here as Attachment AD-50.
AD-51	CNSC	Section 8.3.3 and 8.5, Aquatic Environment and Fish health	Denison has committed to additional baseline data gather as part of their response to IR-107.	Also related to IR-120 and IR-125, CNSC staff recommend Russell Lake be included in this baseline collection to increase the robustness of the established baseline in the final EIS.	Acknowledged. Denison will consider this request as it develops the plans for additional baseline collections, as well as the monitoring program design documentation for aquatic environment monitoring that is planned to be part of the licensing submission. It is noted that no aquatic environment effects are predicted to accrue in Russell Lake in relation to any phase of the Project and the concentrations of all water quality constituents are predicted to remain below aquatic protection values.
AD-52	CNSC	Section 8.3.3.1, Methodology and Metrics	Denison has indicated that exposure to other pre-existing stressors could result in abnormal conditions or deformation(s) in existing population, but the extent of existing conditions should be evaluated to ascertain whether the rate is increasing as a result of proposed activities once in operation.	Related to IR-121, CNSC staff recommend that Denison add text to EIS to reflect that no gross abnormalities in fish were observed during field work.	The text of revised Draft EIS Section 8.3.3.2 has been revised as recommended to indicate that that no gross abnormalities in fish were observed during baseline field work.
AD-53	CNSC	Section 8.3.8, Monitoring and Follow-up	<p>Section 8.3.8 of the EIS states: "Changes in fish communities/populations will be assessed through comparison of Construction, Operation, and Decommissioning results to pre-development."</p> <p>Tracking changes in fish communities / populations in reference lakes over time should be conducted, as reference lakes can be used to differentiate natural temporal variation with potential project impacts.</p> <p>Denison has committed to inclusion of reference lakes in study designs used to assess changes in fish communities / populations over time.</p>	Related to IR-122, CNSC staff recommend that Denison strengthen discussion of reference lakes, and their use, in EIS.	<p>Additional text (see below) has added to the fifth paragraph of Section 8.3.8 of the revised Draft EIS regarding aquatic environment monitoring program sampling areas and “reference lakes” more specifically, as follows.</p> <p>“Changes in fish communities/populations will be assessed through comparison of Construction, Operation, and Decommissioning results to pre-development conditions, as well as through contemporaneous comparison of “exposure area” versus “reference area” data. In this context an “exposure area” is an area downstream of potential mine influence and a “reference area” is an area outside of potential mine influence. Where possible, the reference area would be located in the same drainage, upstream of mine influence where conditions closely mimic those downstream</p>

<sup>2</sup> Unless otherwise stated, the section noted refers to the draft EIS

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>2</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response
					as is possible and where there is no, or reduced likelihood that exposure and reference fish populations can co-mingle.”
AD-54	CNSC	Section 9  Various pages in section 11.1, Land and Indigenous Resource Use Section 12 Section 14	The increased road traffic (14-18 trucks per day during construction/operations) may have indirect impact on ungulates, furbearers and wood land caribou presence/absence for traditional and subsistence hunting have been raised to CNSC staff when meeting with Indigenous Nations and communities and are presented in the EIS.	Related to IR-128, Denison should have follow-up discussions with the Ministry of Saskatchewan Highways, Indigenous Nations and communities (including KML and ERFN) and stakeholders regarding adding additional pull-outs to the highway to ensure safety for northern residents.	Acknowledged. We note that the Ministry of Highways and Infrastructure is responsible for construction and maintenance of highways in the province and Denison has no power or authority to construct pull-outs. However, Denison is committed to ongoing engagement throughout the life of the project and can provide input to Ministry of Highways and Infrastructure as applicable.
AD-55	ECCC	Section 9.2.5.2.7, Waste and HazardousMaterials Management	Vehicles and equipment with engines adhering to Tier 4 emission standards should be employed where feasible in order to minimize emissions. Regardless of engine tier used, best management practices should be followed, including proper maintenance of engines and anti-idling measures.	Related to IR-139, the Proponent should commit to following best management practices regarding the use of vehicles and equipment, including proper maintenance of engines and anti-idling measures.	Section 2.8 of the EIS and the commitment register included with this submission outlines Denison’s plan to regularly maintain and inspect equipment and machinery to make sure they are in good working order.
AD-56	ECCC	Section 9.3.1.3.1, Spatial Boundaries for Ungulates, Furbearers and Woodland Caribou	The EIS and the IR response did not provide sufficient information to understand how the Regional Study Area (RSA) boundaries for caribou were determined.	<p>Related to IR-137, An assessment typically involves setting a geographic area for the assessment for the direct and indirect effects of a proposed project; this area is sometimes referred to as the Local Study Area (LSA). ECCC advises that the LSA is likely to extend beyond the Project footprint and a 500m buffer. ECCC demonstrated that the application of a 500m buffer to mapped anthropogenic features best represents the combined effects of increased predation and avoidance on caribou population trends at the national scale (Environment Canada, 2011). However, adverse effects of projects including predator and prey access to undisturbed areas, reduction in connectivity, and sensory disturbance to individuals of boreal caribou can vary and extend several kilometers depending on project activities and ecological context. The LSA should at the minimum capture the above-mentioned effects.</p> <p>A Proponent will also set a geographic area for the assessment within which the cumulative effects of the proposed Project are possible; this is sometimes referred to as the RSA. Typically the range(s) is(are) the proper scale to assess cumulative effects. However, assessing cumulative effects may require a different approach for large continuous ranges than for smaller discrete ranges. The impact of disturbance that may be concentrated in part of a large continuous range may be masked given the size of the range. For large continuous range it may be relevant to assess cumulative effects at the scale of the range but also at a smaller scale.</p> <p>The Proponent should consult with experts of the relevant jurisdiction in order to determine the local and regional study area, and provide a justification of the extent of the study areas in the impact statement.</p>	<p>The reviewer is also referred to the response to IR-137 and the response to AD-56 should be read in conjunction with it. The following is provided for reference.</p> <p>As per accepted environmental assessment methodology, the spatial boundaries were established to capture the extent of the expected/likely adverse effects, both direct and indirect, on the various valued components, that were expected as a result of the Project.</p> <p>The Project Footprint was delineated as the maximum extent of physical, direct disturbance resulting from the Project.</p> <p>The LSA was delineated to capture the extent of all direct, and most indirect effects of the Project on the wildlife VCs, including woodland caribou.</p> <p>The RSA was delineated to capture the extent of all likely Project effects, in consideration of the life-requisites and behavior of the various VCs being assessed (i.e., a habitat-based assessment) including ungulates (e.g., woodland caribou) which are known to have large home ranges. The RSA was also delineated in the context of the cumulative effects assessment, as it related to the region. Further the RSA is considered representative, as it includes habitat (ecosite types) that are found throughout the SK1 range. In particular, based on the habitat and its potential to support woodland caribou (as classified by the Saskatchewan Ministry of Environment) within the RSA is relatively consistent with the remainder of the habitat in the SK1 range (see Figure 2.1 in Appendix 9-F of the revised draft EIS).</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>2</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response
					<p>These study areas are appropriate, in that they capture the extent of the likely adverse effects of the Project on the VCs, to provide an ecologically relevant determination as to the likely adverse effect on the regional population of all assessed VCs, including woodland caribou (i.e., no dilution of the effects over the entire SK1 range – although this has been provided for context).</p> <p>The 500 m buffer around a physical disturbance was considered in the context of the extent of sensory disturbance, to allow Denison to determine the geographical extent of an effect (i.e., limited to the LSA, limited to the RSA) to allow the appropriate characterization of the effect to inform the determination of significance.</p> <p>Cumulative effects occur when the adverse effects of the Project, overlap in time and space, with the adverse effects from other projects and activities. As such, the RSA is the appropriate scale to appropriately conduct a defensible cumulative effects assessment – i.e., the effects of projects that are beyond the RSA spatial extent would not likely result in residual effects that could act cumulatively with the Project’s effects, and consideration of effects that do not overlap spatially or temporally, are not cumulative, by definition.</p> <p>The Project is likely to add another 0.4% of anthropogenic disturbance (considering the Project Area of 169.6 ha) resulting in up to 1.9% of total anthropogenic disturbance in the Terrestrial RSA. As such, the Project's contribution to the cumulative effect is 0.001% of additional disturbance in the SK1 range, which is below the accepted threshold level of anthropogenic disturbance based on the SK1 range plan (ECCC 2020). The Ministry of Environment has indicated that the current level of anthropogenic disturbance is 53% within the SK1 range, which is below the accepted threshold level of 55% for anthropogenic disturbance for the SK1 range.</p>
AD-57	ECCC	Section 9.4.5.2.1 Work Timing Windows and Habitat Disturbance	<p>In their response to IR-167, the Proponent states: “Site clearing and other works that involve disturbance of vegetation and/or soil will be completed during least-risk timing windows for migratory birds and SAR (i.e., winter), where practical, to avoid disturbance during sensitive time periods. It is noted that additional information related to timing windows and species as it concerns Project activities has been provided in response to IR-134.</p> <p>Pre-clearing surveys will be conducted and set-back buffers implemented, as needed. The pre-clearance surveys will be completed prior to all clearing events, regardless of the time of year / season when clearing is set to occur. If nests or tree cavities should be encountered during pre-construction surveys or ongoing</p>	Related to IR-167, provide details on how vegetation clearing related to site development will be conducted to avoid harm to migratory birds and species at risk (SAR).	<p>The reviewer is also referred to the response to IR-167 and the response to AD-57 should be read in conjunction with it. The following is provided for reference.</p> <p>As noted in the August 2023 IR responses, site clearing and other works that involve disturbance of vegetation and/or soil will be completed during least-risk timing windows for migratory birds and SAR (i.e., winter), where practical, to avoid disturbance during sensitive time periods.</p> <p>However, in the event that site clearing activities or other works are anticipated to occur during a sensitive timing window for migratory birds and SAR, the pre-disturbance wildlife sweeps would be conducted by qualified biologists at least 7 days prior to any</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>2</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response
			<p>monitoring activities, any subsequent Project activities will be in accordance with the 2022 Migratory Birds Regulations.”</p> <p>ECCC does not recommend the use of nest searches or pre-clearing surveys for active bird nests during the breeding season as a mitigation. Instead, ECCC recommends that clearing and grubbing activities not be conducted during the breeding bird season.</p> <p>ECCC does not recommend active nest searches in most cases and for most species, in part because there is a great degree of difficulty associated with reliably detecting nests and a high likelihood of disturbing or damaging active nests while searching.</p> <p>Exceptions to the general nesting period exist, and these include interannual variation and nest searches for certain species which may breed outside of these general periods. Under the MBCA it is prohibited to destroy a nest with a live bird or viable egg, even if this occurs outside of what might be considered a normal nesting period.</p>		<p>scheduled vegetation/land disturbance. The biologist would search the proposed area to be cleared, plus a 100 m buffer, for sensitive wildlife features that may be used by avian SAR (e.g., nests and/or nesting cavities), woodland caribou, and bats (e.g., roosting sites/cavities). The wildlife sweeps will not be species-specific surveys focused on species at risk per se but will be based on timing of Project related activities (i.e., will be completed in advance of site clearing activities). These surveys are intended to identify sensitive wildlife features such as hibernacula, dens, nests, cavities, mineral licks, that would require specific mitigation measures to avoid or minimize adverse effects on identified features and are not species-specific. Nevertheless, the methods associated with these pre-construction and pre-clearing sweeps will be tailored to species at risk that may potentially be using habitats at certain times of the year. For example, methods will include searching prominent topographic features such as rock outcropping or downed forest trees and debris where wolverine may establish denning sites. In the event the sweeps are conducted during the winter period, methods related to snow tracking would identify wolverine presence based on tracks and potential denning sites in the snowpack within ravines or drainages within the forested areas within the study areas (as per Resources Inventory Committee 1999). Additionally, methods will include searching for potential roost trees for bat species, as per protocols included in the Wildlife Habitat Features Field Guide (BC Ministry of Environment and Climate Change Strategy, Ecosystems Branch 2019). Depending on the results of these sweeps, appropriate mitigation measures will be developed and implemented.</p> <p>If sensitive wildlife features are found, they will be documented (e.g., photographs, GPS location recorded). The data collected would inform the development and implementation of appropriate mitigation measures (e.g., appropriate set-back distances for Project activities and/or consideration of timing windows as per SK MOE (2017), in consideration of applicable laws and regulations (e.g., Migratory Birds Conservation Act, Wildlife Act), as appropriate.</p> <p><b>References:</b></p> <p>B.C. 					Saskatchewan Ministry of Environment (SK MOE). 2017. Saskatchewan Activity Restriction Guidelines for Sensitive Species. <a href="https://publications.saskatchewan.ca/api/v1/products/79242/formats/89555/download">https://publications.saskatchewan.ca/api/v1/products/79242/formats/89555/download</a> (accessed July 2021).
AD-58	HC	Section 10.1.4.2.1 (p. 10-22)  Appendix 10-A (ERA): Appendix B Table B.9, Ref. 19-2638  Section 6, Table 6.1-1 (p. 6-7)	Section 6 of the Draft EIS contains Table 6.1-1 (p. 6-7), which lists radionuclides as a key indicator for air quality.  Only uranium and radon are considered in Section 6, and Section 10 Table B.9 does not include doses from uranium progeny in air.	Related to IR-177, consider rewording Table 6.1-1 to “radon” instead of “radionuclides” to avoid confusion.	Acknowledged. The revision to Table 6.1-1 has been made as suggested.
AD-59	CNSC	Section 10.1.6.1.1, Human Receptors Selection and Characterization	Within the Human Health assessment, offsite receptors during the operation period are only considered downstream of Whitefish Lake. The only identified concern was for Se to the Fisher/Trapper located at Russel Lake. This section cites Indigenous Knowledge as informing the receptor selection and location.  While the assessment is fairly conservative in the assumptions made on intake and receptor habits, it stands to reason that if the trapper receptor was located closer to the operation, such as at McGowan or Whitefish Lakes, this exceedance of Se could be more pronounced.  In terms of maintaining a conservative assessment, if the most vulnerable receptor can be shown to be protected at the point of highest expected COPC concentration, it can be concluded that this receptor would be protected further away from the project. Considering this, why was the hunter/trapper receptor not also assessed at Whitefish or McGowan Lake? Was Indigenous Knowledge specific in mentioning Whitefish or McGowan Lakes were not used for the activities carried out by identified receptors?	Denison has addressed IR-180, but has not considered the suggestion for establishment of additional treatment technologies of COPCs.  CNSC staff maintains that there may be the need to establish additional treatment for effluent should environmental monitoring during operation indicate COPC’s are accumulating in the environment beyond what is anticipated in the EIS.  This is a firm reminder that this will be evaluated as part of the licensing phase of the project, should it proceed.	Acknowledged; it is understood that consideration of treatment technologies will be part of the licensing phase of the Project.
AD-60	CNSC	Section 11, Perceived Risks to Lands and Resources	The EIS states: “Resource users may also experience changes in their perception of the quality of resources for consumption such as the palatability of fish or wildlife or have apprehensions about the safety of resources for consumption. These changes may affect the patterns of ILRU during all Project phases including Post Decommissioning. The ERFN refer to this indicator as a “psycho-social’ effect, meaning that even if people know their fears are <i>“perceived fears, the fear ... is real and has real impacts on ERFN members’ perception of their overall health and well-being”</i> (ERFN and SVS 2022a).” (p. 11-11)	Related to IR-207, as Denison continues to work with Indigenous Communities of Interest on community specific monitoring regimes, please provide additional information in the IER on any updates on engagement activities to date that have taken place with KML and ERFN and any other Indigenous Nations and communities who utilize the area, with respect to follow-up monitoring plans that are being developed to support the Project licensing and permitting.  If Denison has made commitments with respect to this, this is information that should also be included in the commitments report.	Denison continues to work with its Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a community specific monitoring regime, suited to each of their interests and needs, in an agreed-upon fashion. Updated information regarding engagement activities is provided in the updated IER and updated commitments register included with the IR response package.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>2</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response
			CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> state: “The EIS will document specific suggestions raised by Indigenous groups for mitigating the effects of changes to the environment on Indigenous peoples (section 5(1)(c) of CEAA 2012). For the mitigation measures intended to address the effects of changes to the environment for Indigenous peoples, the Proponent must discuss the residual effects with the Indigenous groups prior to submitting the EIS.” These changes may affect the patterns of ILRU during all Project phases including Post Decommissioning.		
AD-61	CNSC	Various sections of the EIS, including: Section 9 Section 10 Section 11, including Section 11.1.4.3.1 (p. 11-46) Section 12 Section 16	<p>ERFN indicated they are concerned about declining moose populations from an influx of hunters; more people may be accessing the area year after year, and worried populations may be affected by the Project (21-EN-ERFN-473.13).</p> <p>Further, the EIS highlights that: “Vehicle collisions are the most likely source of direct mortality for moose. Effective mitigation measures (e.g., breaks in snowbanks; speed limits; and exclusion fencing around contaminated waste pads and ponds) will be implemented to reduce moose mortality.” (p. 11-46)</p> <p>To address potential concerns specific to Project related effects to wildlife species of interest to the Indigenous Communities of Interest, Denison has committed to collaborating with ERFN and KML on a monitoring regime suited to each of their interests and needs.</p>	Related to IR-129, Denison needs to ensure that the proposed monitoring regime with ERFN, KML and other Indigenous Nations who utilize the area are included in the commitments table for future EIS submissions.	Denison continues to work with its Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a community specific monitoring regime, suited to each of their interests and needs, in an agreed-upon fashion. Updated information regarding engagement activities is provided in the updated IER and updated commitments register included with the IR response package.
AD-62	CNSC	Various sections of the EIS, including: Section 8 Section 9 Section 10 Section 11 Section 12 Section 15 Section 16  Appendix 16-C (p. 3)	<p>IR-238 requested that Denison provide additional information to demonstrate whether Indigenous Nations and communities were engaged directly on the potential mitigation and monitoring measures to address the concerns raised regarding potential impacts of the Project on the potential or established Indigenous and/or treaty rights.</p> <p>As well, it requested that Denison provide a rationale if this engagement has not been completed. As the Project develops, please provide concrete actions Denison will take in the follow-up and monitoring programs to engage Indigenous Peoples to alleviate concerns and incorporate their interests, and when this engagement is planned to take place.</p>	Related to IR-238, If Denison has made commitments with respect to engagement activities with Indigenous Nations and communities on potential , this is information that should be included in the commitments report.	Please see response to IR-238 and as noted previously Denison continues to work with its Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a community specific monitoring regime, suited to each of their interests and needs, in an agreed-upon fashion. Updated information regarding engagement activities is provided in the updated IER and updated commitments register included with the IR response package.
AD-63	ECCC	Appendix 6-C Climate Baseline and GHG Emissions Report	ECCC recommended that the identification of the sources of GHG emissions and quantification of these emissions be described for the post-decommissioning phase, as was done for the other phases. ECCC recommended that the Proponent discuss the potential impacts that the Project may have on Canada’s ability to meet its climate-related targets, following the guidance of the Strategic Assessment of Climate Change (SACC) and the Draft Technical Guide Related to the Strategic Assessment of Climate	Related to <a href="#">AD-18</a> , ECCC recommends the identification of the sources of GHG emissions and quantification of these emissions be described for the post decommissioning phase. This information will be useful for future development of a net-zero plan.	The Post-Decommissioning phase consists of physical, chemical, and biological monitoring of the site that will be conducted to confirm that the site is chemically and physically stable. Post-Decommissioning extends from the end of physical decommissioning until transfer of the site into the provincial Institutional Control Program or direct release of the land back to the Crown. The Post-Decommissioning monitoring program will be

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>2</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response
			Change: Guidance on quantification of net GHG emissions, impact on carbon sinks, mitigation measures, net-zero plan and upstream GHG assessment.		<p>designed and conducted in accordance with the provincial and federal regulations and licence conditions.</p> <p>For the purpose of the environmental assessment and the stage at which Project development currently stands, Denison believes the information provided on GHG emissions within the EIS documentation is appropriately focused on the Project phases with greatest activity which contribute to Scope 1 and 2 emissions.</p> <p>As noted previously in response to AD-18, in accordance with our discussions with the CNSC, Denison is committed to re-assessing the GHG and climate change components of the EIS and other elements of the SACC once more detailed, site-specific data become available (i.e., detailed feasibility and engineering studies). This is expected to include more detailed study around overall GHG emissions, carbon sinks and mitigation options, best available technologies / best environmental practices, climate resiliency, net-zero carbon planning and offsetting.</p>
AD-64	ECCC	Appendix 6-C Climate Baseline and Greenhouse Gas Emissions Report	<p>ECCC noted that more specific data, such as regional data from provinces, forest companies, or literature may be available. The use of Table 20 of the draft Technical Guide does not apply.</p> <p>ECCC recommended that the Proponent also consider biomass that are not aboveground and confirm whether soil carbon is taken into account, as well as wetlands.</p> <p>ECCC recommended that the Proponent provide a quantitative and qualitative description of the Project’s impact on carbon sinks, following the guidance of the SACC and the draft Technical Guide.</p>	<p>Related to <a href="#">AD-19</a>, ECCC recommends that the Proponent revisit the land use calculation provided in the draft Environmental Impact Statement as the use of Table 20 of the draft Technical Guide for the above ground mass of vegetation species is not appropriate. This table is for above-ground woody vegetation in cropland systems which does not apply in this instance. A simple site survey would determine above-ground biomass on site using basic information such as site class and species. More specific data, such as regional data from provinces, forest companies, or literature may be available, while generic national data is available (e.g., <a href="#">Biomass Estimates for Major Boreal Forest Species in West-Central Canada</a> (publications.gc.ca), <a href="#">Canada’s Forest Biomass Resources: Deriving Estimates from Canada’s Forest Inventory</a> (nrcan.gc.ca)).</p> <p>ECCC reiterates the advice that the Proponent provide information regarding the consideration of biomass that are not above ground, specifically whether soil carbon and wetlands are taken into account.</p> <p>ECCC also restates the advice that the Proponent provide a quantitative and qualitative description of the Project’s impact on carbon sinks, following the guidance of the SACC and the draft Technical Guide.</p>	<p>It is anticipated the GHG and climate change components of the Project will be re-evaluated once more detailed, site-specific data becomes available; this will be done after the EIS process is concluded and possibly as part of sustainability reporting. This analysis is expected to include more detailed study around overall GHG emissions (including land use changes - forest/vegetative biomass, soil carbon, wetlands), carbon sinks and mitigation options, best available technologies / best environmental practices, climate resiliency, net-zero carbon planning and offsetting.</p>
AD-65	CSNC	Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit	In response to IR-82, Denison highlights the importance of the S redox couple (S(2-)/S(6+)) near the ore zone.	Related to IR-82, CNSC staff recommend that Denison consider the inclusion of hydrogen sulfide test kits for in-field measurements of H2S to supplement qualitative interpretations (e.g., absence of "rotten egg" odor associated with sulfide) relating to redox conditions.	Acknowledged and Denison thanks CNSC staff for this recommendation. The recommendation will be considered within the context indicated during future planning.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>2</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response
		Appendix 7-C, Section 3.5			
AD-66	ECCC	Appendix 7-C, Numerical Modelling: Post Decommissioning Evaluation, Section 2.3.1.4, Desilicified Zone	<p>The Proponent states in both the EIS and their response that a hydraulic conductivity value of 5x10<sup>-6</sup> m/s was uniformly assigned to the model layers representing the Desilicified Zone. They additionally state that this value is consistent with packer and pumping tests screened in this unit that have interpreted hydraulic conductivity values ranging from 1x10<sup>-6</sup> to 3x10<sup>-5</sup> m/s (Appendix C), with a geomean of 6.0x10<sup>-6</sup> m/s.</p> <p>In their IR response, the Proponent stated that the hydraulic conductivity used as the model base case (5x10<sup>-6</sup> m/s) is similar enough to the geometric mean value (6x10<sup>-6</sup> m/s) that no consequential change to the model would occur if the geometric mean were to be used. The use of the value of 5x10<sup>-6</sup> m/s as the model base case was not substantiated.</p> <p>ECCC accepts the response to Part 1 of the IR as the Proponent has stated that 5x10<sup>-6</sup> m/s and 6x10<sup>-6</sup> m/s are similar enough hydraulic conductivities that redoing modelling with the geometric mean is not expected to consequentially change outputs for either the PHREEQC or FEFLOW model. However, the reasoning for selecting the value of 5x10<sup>-6</sup> m/s was not clear.</p>	<p>Related to IR-89, while repeat modelling using the geometric mean hydraulic conductivity of 6x10<sup>-6</sup> m/s is not required, include a statement in the EIS to indicate that the geometric mean hydraulic conductivity was not used in the model and providing justification for using the value of 5x10<sup>-6</sup> m/s instead.</p>	<p>The revised Draft EIS text (Appendix 7-C, Section 2.3.1.4 has been updated to report the geomean of the desilicified zone will be updated to 4.8x10<sup>-6</sup> m/s. The previously reported value of 6x10<sup>-6</sup> m/s was erroneous.</p> <p>“A hydraulic conductivity value of 5x10<sup>-6</sup> m/s was uniformly assigned to the model layers representing the Desilicified Zone. This value is consistent with packer and pumping tests screened in this unit that have interpreted hydraulic conductivity values ranging from 1x10<sup>-6</sup> to 2x10<sup>-5</sup> m/s, with a geomean of 4.8x10<sup>-6</sup> m/s. As within other units, the geomean value was not applied directly, but rather a rounded value slightly higher than the geomean was applied throughout the entire desilicified zone. The value applied within the desilicified zone is considered conservative as it is a factor of 1.9 higher than the most-reliable hydraulic conductivity estimates (i.e., values obtained through pumping tests measured the conductivity as 2.7x10<sup>-6</sup> m/s) and is equivalent to the geomean value.”</p>
AD-67	Health Canada (HC)	Appendix 10-A, Section 3.2.1.3.1, p.3.43-3.44	<p><b>Inappropriate use of an outdated standard in assessing health and environmental effect(s) from short-term exposure to nitrogen dioxide (NO<sub>2</sub>).</b></p> <p>The Draft EIS technical supporting document (Appendix 10-A) appears to misinterpret Health Canada’s 2016 Human Health Risk Assessment for Ambient Nitrogen Dioxide (NO<sub>2</sub>) in setting its screening criteria and evaluating the health impacts from exposure to Nitrogen Dioxide. The document states:</p> <p><i>“Health Canada published a national one-hour maximum acceptable level of 400 µg/m<sup>3</sup> for NO<sub>2</sub> in ambient air using a risk assessment approach (Health Canada, 2016b). This value considers sensitive human populations.”</i></p> <p>This statement is inaccurate.</p> <p>As indicated in Health Canada’s 2016 publication, this value (400 µg/m<sup>3</sup>) refers to the National Ambient Air Quality Objective (NAAQO) for NO<sub>2</sub>, developed in the 1970s. The Canadian Ambient Air Quality Standards (CAAQS) were later developed in consideration of both human health and the environment to replace existing Canada-wide standards, including the NAAQOs, and in many cases are the most stringent Canadian air quality standard, guideline or objective.</p>	<p>The CAAQS are recommended as the most stringent air quality standard for assessing health and environmental effect(s) from short-term exposure to NO<sub>2</sub> in the project.</p> <p>The CAAQS are generally calculated for specific multi-year averages and for a particular statistical form so that extreme and unpredictable events do not drive risk management. However, if the data is not available for comparison to a full CAAQS timeframe, Health Canada suggests using model results for at least one calendar year to allow for a basic comparison with the CAAQS statistical form. The modelling results should be able to indicate the frequency of CAAQS exceedances, which can be used in the discussion as to whether any anticipated human health impacts are anticipated</p> <p>Modelled predictions within an air quality assessment’s study area should be compared to the most stringent air quality standards, guidelines or objectives applicable to the region that may be affected by project activities. In this case, CAAQS are the most stringent levels and CAAQS are not restricted to applications only within the context of the <a href="#">Air Quality Management System</a> (AQMS). Evaluation against the CAAQS may be considered in determining the nature and severity of the project’s impact on air quality levels and the resulting mitigation measures that may be required to maintain good air quality levels or to prevent an exceedance of the CAAQS.</p>	<p>Acknowledged. The reviewer is referred to the response to IR-190 for a discussion of the use / interpretation of the CAAQs in the EIS.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>2</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response
			The new CAAQS for NO2 also recognizes that there is no population health threshold for human health effects; therefore, any increase in exposure will result in an incremental population risk (Environment Canada and Health Canada, 2012; CCME, 2000). In other words, NO2 is considered to be a non-threshold substances, meaning that health effects may occur at any level of exposure. Therefore, guideline values should not be construed as limits to which polluting up to is allowed.	<p>As health effects can occur even at levels of exposure below the limits set out in the CAAQS, they should not be viewed as “pollute-up-to” levels. It should be acknowledgeable that health risks exist below the guidelines. In addition, the principles of keeping clean areas clean and continuous improvement are operative, thus proposed mitigation measures should not be confined to meeting the standards, but should also be targeted towards reducing population exposure to CACs associated with the proposed project.</p> <p>This advice is also relevant to IR-190 and may be of use in responding to that request for a comparison of the predicted maximum concentrations to the most protective applicable air quality standards available (i.e., CAAQS).</p>	
AD-68	ECCC	Appendix 16-A Summary of Residual Effects Appendix 16-B Summary of Cumulative Effects	<p>ECCC recommended the inclusion of an assessment of potential GHG mitigation measures throughout all phases of the Project including a Best Available Technologies / Best Environmental Practices (BAT/BEP) Determination, as described in Section 3.2 of the draft Technical Guide.</p> <p>ECCC also recommended the development of a credible Net-Zero Plan on how to achieve the target of 0 kt CO2 eq/year, for the year 2050 and beyond, following the guidance of the SACC and the draft Technical Guide.</p>	Related to <a href="#">AD-49</a> , ECCC notes the comment provided by the Proponent stating, “Denison will consider the option of preparing a climate resiliency assessment with consideration to best available technologies / environmental practices (BAT/BEP) as well as a net-zero plan as the Project advances”. ECCC continues to recommend that the Proponent align with best practices by including in the EIS a Best Available Technologies / Best Environmental Practices (BAT/BEP) Determination and a credible Net-Zero Plan on how to achieve the target of 0 kt CO2 eq/year, for the year 2050 and beyond, following the guidance of the SACC and the draft Technical Guide.	The information presented in the Draft EIS meets the requirements of CEEA 2012. Per Denison’s response to AD-49 (Annex 1, page 419/419) the company will consider the option of preparing a climate resiliency assessment with consideration to best available technologies / environmental practices (BAT/BEP) as well as a net-zero plan as the Project advances but is not intending to include this information in the revised Draft or Final EIS.
AD-69	CNSC	Appendix 16-C	<p>The EIS and the Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information. It is not clear which monitoring programs will be employed to demonstrate regulatory compliance, and compliance with the commitments Denison has made to its Indigenous and non-Indigenous Stakeholders.</p> <p>The CNSC’s Generic Guidelines for the Preparation of an Environmental Impact Statement (EIS), also state: “The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the proponent intends to implement them and the environmental outcome the mitigation is designed to address.</p> <p>CNSC staff requested in the March 2023 letter to Denison (e-Doc <a href="#">6991467</a>) a Commitments Table for the Wheeler River EIS. This letter requested information of all commitments made by Denison with detailed information such as:</p> <ul style="list-style-type: none"><li>✓ details of the commitment</li><li>✗ which phase(s) of the project will the commitment be carried out (e.g., all phases)</li><li>✓ where the commitment is referenced (which document, table, etc. and where it can be found)</li></ul>	<p>For the next draft EIS submission, the evergreen Commitments Table should be updated to include:</p> <ul style="list-style-type: none"><li>• which phase(s) of the project will the commitment be carried out (e.g., all phases)</li><li>• how this commitment will be tracked (project EA follow-up program, site-wide programs, etc.) and;</li><li>• all commitments to Indigenous Nations and communities</li></ul>	Please refer to the commitments register included with Denison’s IR response package.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>2</sup>	Context and Rationale	Advice to the Proponent	Denison’s Response
			<p>✖ how this commitment will be tracked (project EA follow-up program, site-wide programs, etc.)</p> <p>Several commitments to Indigenous Nations and communities from the August 2023 submission appear to be missing from this table and should be included in the next submission.</p>		
AD-70	ECCC	Appendix 16-C Summary of Monitoring & Follow-up Programs	ECCC recommended that the Proponent consider developing a GHG follow-up program to measure and compare actual GHG emissions against the EIS estimates, including reporting the Project’s actual emissions and updating the emissions estimates as needed.	Related to <a href="#">AD-48</a> , ECCC acknowledges that the Project will likely be required to report annually per section <b>46</b> of the <b>Canadian Environmental Protection Act</b> as the annual emissions are likely to be over 10,000 tonnes of CO2e. However, ECCC’s suggestion incorporates additional components to align with the goal outlined in Appendix 16-C of the draft EIS to “assess the environmental performance of the project relative to the predictive assessment that has been completed in support of the environmental assessment process”. This would involve comparing actual vs. estimated emissions following the terms of the SACC’s net GHG emissions equation and evaluating the effectiveness of GHG-related mitigation measures.	Greenhouse gas emissions (GHGs) were not included as a valued component in the EIS, and as such, Denison is not proposing to add GHG monitoring to the EA follow-up monitoring to remain consistent with the methodology and scope for an EA completed under CEAA 2012. The annual GHG reporting will provide the required and relevant information to regulators per the Canadian Environmental Protection Act. Denison’s ESG reporting framework will be developed as the Project advances and will be scoped beyond the components of the EIS.
AD-71	ECCC	Conceptual Caribou Management Plan	Section 4.2.1 of the Conceptual Caribou Management Plan states that "The Project components are also west of the known home range of woodland caribou (based on tracking data received by the Ministry of Environment; Figure 4-2), although the absence of data does not mean the absence of caribou and Denison has observed caribou in the area." Calculation of home range is normally based on statistical analyses of telemetry data. Home range cannot be inferred from telemetry points and incidental observations from a map	Related to IR-149, the Conceptual Caribou Management Plan should be corrected to remove the reference to caribou home range.	<p>Acknowledged - Version 2 of the Caribou Mitigation Plan (now titled Caribou Management Framework) has been updated to re-word the sentence highlighted by ECCC.</p> <p>For reference and further information, it is noted that Denison continues to work collaboratively with Saskatchewan Ministry of Environment (MOE) on their requirement for an offset for adverse effects on caribou habitat. Denison has advanced the Project-related Caribou Management Framework within the context of the province’s offsetting framework. The MOE has reviewed the draft framework and has provided Denison a notification of their support. Subject to finalization and provincial acceptance, the framework will provide the means to address/offset all residual adverse effects (i.e., those remaining after the application of the proposed mitigation measures) of the Project on caribou that are under provincial jurisdiction.</p>

**Federal Indigenous Review Team (FIRT) – Advice to the Proponent for the Wheeler River Environmental Impact Statement (EIS) March 2023**

\*\* The new [newest Advice to Proponent table](#) is available above

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-01	Canadian Nuclear Safety Commission (CNSC)	Glossary sections	<p>There are terms used throughout the EIS that may either need defining, or inclusion in the glossary.</p> <ul style="list-style-type: none"><li>“Bounding”, “bounding case” and “bound” are used frequently throughout the EIS to describe the scope of the assessment. For example, p. 2-6 the EIS States: “Denison has bound the environmental assessment above the deposit...”</li><li>“Laydown”. P. 2-54 states: “During Construction, Denison plans to create a laydown area next to the future domestic landfill to temporarily store construction waste. Examples of materials include clean wood, plastics, metal, and concrete. The construction laydown area will not be lined, but it will have a berm surrounding the area to minimize run-on and runoff.”</li><li>“Deflagration” (p. 2-22)</li><li>“Speed of sound” The EIS states: “Deflagration means the material burns slower than the speed of sound, thus no shock waves are generated. Propellant permeability enhancement methods reach injection pressures of up to 8,000 psi and are near instantaneous over periods of milli seconds...” (p. 2-22) - Explain briefly what is meant by “speed of sound”</li><li>“Dries” (p. 2-65): “the main dries will be located in the processing plant”</li><li>“Scarified” 2-84 Laydown areas will be scarified, covered with 0.5 to 1.0 m of stockpiled overburden, and vegetated with native, self-sustaining species.</li><li>“Furblock” (p. 4-29)</li><li>“Cutlines” (p. 4-101)</li></ul>	Add this terminology to either one of the early glossaries, or when describing the methodology, in order to help readers understand these terms (particularly non-technical readers, such as Indigenous peoples and members of the public).	Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.
AD-02	CNSC	General	Mining solution and lixiviant are used interchangeably throughout the EIS. When both are used periodically, may be difficult for a member of the public to recognize that these are one in the same (mining fluid seems more often used).	Be consistent in how this is referred to, in order to ensure it’s clear to readers that these are one and the same.	Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.
AD-03	CNSC	Throughout the Executive Summary (ES) and draft EIS	<p>Errors in formatting and grammar were identified throughout ES and EIS. Some examples are underlined below:</p> <ul style="list-style-type: none"><li>“often referred to as “the final uranium product <u>yellowcake</u>” (ES, p.16 )</li><li>“Whitefish <u>Lake,;</u>” (ES, p.47)</li></ul>	Please correct these and any other formatting, spelling or grammatical errors.	Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.

<sup>3</sup> Unless otherwise stated, the section noted refers to the draft EIS

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
			<ul style="list-style-type: none"><li>“Forest fires are common throughout most of northern Saskatchewan, however, and are an important natural disturbance of northern boreal forest ecosystems” (p.72)</li><li>“Other comments that the process reminded them of fracking, which carried a negative connotation...” incomplete sentence (EIS, p. 2-3)</li><li>“During this phase, water taking will mainly be used by the processing plant and wellfield remediation and to support the potable water plant and wash bay.” (EIS, p. 8-29)</li><li>“In McGowan Lake, meanmercury concentrations in Northern Pike” (EIS, p. 8-224)</li><li>“Flows and water levels in lakes and rivers within the LSA will realize some adverse change (reduction) as a result of overprinting drainage areas reporting specifically to Whitefish Lake and water taking from this same waterbody.” (8-38)</li><li>“Residual effects characteristics specific to Fish Health are defined in Table 8.5-6 with evaluation of residual effects provided in ” (EIS, p. 8-242)</li><li>“Potential Project residual effects on the Fish Health VC are primarily related to c the controlled” (EIS, p. 8-249)</li><li>“...resulting in a moderate level of uncertainty.” (EIS, p. 9-47)</li><li>“...the assessment. AD-04	CNSC	Section 2.2.1 Mining (p. 2-4 to 2-5)	An arial view could be useful to help a reader understand the proposed freeze wall earlier in section 2 (e.g., The shape, whether it surrounds the deposit). This is unclear but there are good images further down in the EIS (i.e., Figure 2.3-1 on p. 2-78).	Consider adding image to Section 2.2.1, similar to or containing aspects of Figure 2.3-1.	Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.
AD-05	Transport Canada (TC)	Sections 2.2.3.2, 2.2.3.10, 2.2.5.1, 2.3.1.6, 8.3.4.2.2, 11.1.4.4.2,	The two water crossings over Kratchkowsky Creek and Hart Creek and the water intake and effluent discharge/intake pipeline and diffuser at Whitefish Lake may be subject to the <i>Canadian Navigable Waters Act</i> (CNWA). However, these works may be exempt from the CNWA, if they meet the requirements of the Minor Works Order.	<p>*This advice pertains to the regulatory phase.*</p> <p>It is recommended that the Proponent self-assess each work using TC’s Project Review Tool as follows: <a href="https://npp-submissions-demandes-ppn.tc.canada.ca/projectreview-outildexamenduprojet">https://npp-submissions-demandes-ppn.tc.canada.ca/projectreview-outildexamenduprojet</a></p>	Acknowledged and Denison will address this in the regulatory phase as highlighted.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
				<p>If the works do not fit the Minor Works Order, the Proponent has the option to either submit an application for approval to the NPP, or use the public resolution process, as these are all unscheduled waterways. The full text of the Minor Works Order is available here: <a href="https://laws-lois.justice.gc.ca/eng/regulations/SOR-2021-170/page-1.html">https://laws-lois.justice.gc.ca/eng/regulations/SOR-2021-170/page-1.html</a>.</p> <p>Background information on the NPP, the Minor Works Order, the application for approval process and the public resolution process are available here: <a href="https://tc.canada.ca/en/programs/navigation-protection-program/apply-npp">https://tc.canada.ca/en/programs/navigation-protection-program/apply-npp</a></p>	
AD-06	Environment and Climate Change Canada (ECCC)	Section 2.2.3.8, Project Description	<p>In this section it is stated that: “The third step of the Industrial Wastewater Treatment Plant (IWWTP) is anticipated to further neutralize and improve the remaining water quality proposed to be achieved with further pH adjustments through agitated tanks and a clarifier with negligible solids generation expected at this stage. Several additional technologies including ion exchange are being evaluated as part of an ongoing Best Available Technology Study to be complete as part of future permitting.” ECCC would be interested in reviewing this study when it becomes available.</p> <p>Considering that the third step of the effluent treatment process in the IWWTP is still undergoing development, ECCC cannot make final conclusions regarding the efficacy of the treatment process. When final treatment technologies have been evaluated and selected, ECCC would like to review this information to allow for release to the environment.</p>	ECCC requests the opportunity to review the Best Available Technology Study and selected treatment technologies for the IWWTP when the report becomes available.	The BATEA information for the IWWTP will be included in Denison’s application to the CNSC for a license to operate. As such, ECCC can direct their review request for review to the CNSC.
AD-07	TC	Section 2.2.5.3	<p>With respect to the proposed airstrip, under the <i>Aeronautics Act</i>, the proposed airstrip would be considered an “aerodrome”, which is defined as:</p> <p>“aerodrome means any area of land, water (including the frozen surface thereof) or other supporting surface used, designed, prepared, equipped or set apart for use either in whole or in part for the arrival, departure, movement or servicing of aircraft and includes any buildings, installations and equipment situated thereon or associated therewith.”</p> <p>Aerodromes, including the one proposed by Denison, are subject to the <i>Aeronautics Act</i> and the Canadian Aviation Regulations (CARs).</p>	<p>*This advice pertains to the regulatory phase.*</p> <p>The proponent must notify the Minister of Transport of the proposed airstrip (aerodrome). This notification, being a summary report to the Minister of Transport, is required by section 307 of the CARs (CARs 307). CARs 307 also requires Denison to undertake consultation in the prescribed manner before it constructs the proposed aerodrome at the mine site. Details of the consultation are to be included in the above-mentioned summary report to the Minister of Transport.</p> <p>CARs 307 identifies the requirement to consult to include anyone seeking to undertake a prescribed aerodrome work at a certified or non-certified aerodrome, whether it is the creation of a new aerodrome or, at an existing aerodrome, lengthening an existing runway or making a new one. The Regulation also provides minimum expectations for how the consultation should be conducted, including timelines, who to notify and under what circumstances. The intent of the Regulation is to compel</p>	Acknowledged and Denison will address this in the regulatory phase as highlighted.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
				<p>consultation in advance of an aerodrome work that will result in sustained and regular impact on interested parties as identified in the Regulation.</p> <p>As the proposed aerodrome will not be within 4 kilometres of a city or built-up area, under CARs 307, the proponent is required to consult the following interested parties:</p> <ul style="list-style-type: none"><li>(i) the Minister of Transport,</li><li>(ii) the providers of air navigation services,</li><li>(iii) the operator of a certified or registered aerodrome located within a radius of 30 nautical miles from the location of the proposed aerodrome work,</li><li>(iv) the authority responsible for a protected area located within a radius of 4 000 m from the location of the proposed aerodrome work,</li><li>(v) any local land use authority where the proposed aerodrome work is to be carried out, and</li><li>(vi) the owner of any land bordering the land on which the proposed aerodrome work is to be carried out.</li></ul> <p>Proponents are encouraged to share their plans with the local land use authority before the consultation period. The local land use authority may have information about other nearby projects or developments that could impact on the proponent's plans.</p> <p>In summary, regarding the airstrip (aerodrome), the proponent must complete the consultation and file the summary report with the Minister of Transport, prior to commencing construction of the aerodrome.</p> <p>Further details can be found at: <a href="https://laws-lois.justice.gc.ca/eng/regulations/SOR-96-433/FullText.html#s-307.01">https://laws-lois.justice.gc.ca/eng/regulations/SOR-96-433/FullText.html#s-307.01</a>.</p> <p>TC recommends that the proponent contact TC's Aerodromes Group at <a href="mailto:CASPNR-SACRPN@tc.gc.ca">CASPNR-SACRPN@tc.gc.ca</a> before starting the consultation, to ensure it is completed in accordance with CARs 307.</p>	
AD-08	CNSC	Figs. 3.4-1, 4.3. 1, and where applicable throughout the EIS	Some maps in the EIS do not contain highway numbers.	Please consider including the highway numbers on the maps early in the Draft EIS when laying out the project location so the reader can become familiar with road network within northern Saskatchewan when discussions take place.	Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.
AD-09	CNSC	Section 4, including Figures 4.3.1 and/or 4.3.2 and where	The maps included in the EIS in sections do not have any Treaty boundaries. First Nation Treaties should be included on the map. Not all First Nations reserves, and boundaries are included on the map such as Cree Lake and Slush Lake, please include on map and consider adding others from the NAD.	It is recommended that Denison update the maps in these sections to include Treaty Boundaries and community locations are included on the Project location map in Figure 4.3.2 and other maps throughout the entire EIS where applicable.	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
		applicable throughout the EIS.			
AD-10	CNSC	Section 4	Overall, CNSC believes that Denison is abiding by the communications strategies and products identified in their PIDP, but would be interested in additional information that is available.	While CNSC staff are satisfied that the proponent meets the requirements with this EIS, further clarity and detail on the strategic planning behind these communications activities would be beneficial and would further support the overall goals of the Project’s engagement activities.	Acknowledged. Further details on the Public Information Program and Public Disclosure will form part of the documentation submitted in support of the CNSC licensing for the Project.
AD-11	CNSC	Section 4  Indigenous Engagement Report (IER)	There is a summary of what engagement activities will occur moving forward. However, it is not clear which engagement activities/meetings will occur during the different stages of the EA/ project life cycle. Please provide additional details upon submission of the Final EIS.	Denison should consider clarifying in the updated IER which engagement activities will occur during each stage of the project moving forward as per Reg Doc 3.2.2 before submitting the Final EIS.	The engagement activities as outlined in the draft EIS are reflective of the iterative nature of engagement with respect to the Project.  At the time of the filing of the final EIS, Denison will describe the status of engagement and future expected engagement activities to occur, which will continue to be aligned with the requirements of Reg Doc 3.2.2.
AD-12	CNSC	Section 4  IER	Information included in the EIS Section 4 and IER regarding engagement activities, communication and issues and concerns raised will need to be updated when the next version of the EIS is submitted. The EIS and IER will need to be updated to include information from Fall of 2022 until approximately two months prior to the submission date of the next EIS.	When re-submitting the EIS, ensure that the engagement log, issues and concerns tables and information about engagement activities done to date have been updated. No action needed only advice to update this section before submission with most up to date engagement activities including any that take place with other Indigenous Nations and communities not included in the Draft EIS.	Acknowledged.
AD-13	CNSC	Section 4  IER	Denison states that validation of VC selection was completed with ERFN, the Northern Village of Beauval, the Northern Village of Pinehouse Lake, and the Northern Hamlet of Patuanak (hereafter Beauval, Pinehouse, and Hamlet of Patuanak, respectively). The EIS states that this was completed through a shared online survey. The EIS also indicates that YNLR was also included in this process.	How has Denison validated VC selection with the other Indigenous Nations and communities that have showed interest and if so, by what methods (survey’s, engagement, meetings, review of Draft sections etc.?) Did Indigenous Nations and communities select any VC’s that were not included in the EIS and if so why not?  Please elaborate and provide more details in the EIS on any other methods used including engagement sessions that were completed with Indigenous Nations and communities, through in-person community workshops, VC selection approval through early review of Draft EIS sections.	Section 4 of the draft EIS describes the approach taken related to the Indigenous and non-Indigenous Communities of Interest in relation to the Wheeler River Project. Denison has engaged with these entities regarding the validation of the VC selection.  Denison has not undertaken VC validation activities with other Indigenous Nations or communities that have shown interest in the Project, owing to the systematic approach to engagement Denison has been following. This approach is consistent with the methodology presented to the CNSC by Denison in early 2020, for which confirmation was received in mid-2020 and reflected in the draft EIS.  All activities undertaken in relation to engagement on VCs are currently described in the EIS; there are no additional details to add.  Denison can confirm that it is unaware of additional or new VCs brought forward by other Indigenous Nations or communities that are not suitably captured within the current draft EA approach.
AD-14	CNSC	Section 4.3.1, Pg 246	On this page, Denison states that MN-S is “currently structured with a President, an Executive, a Provincial Metis Council, Regional Presidents, and Local Presidents. The wording of ‘Regional	Please update all wording of “Regional President” to “Regional Director” when referring to MN-S.	Thank you for the advice comment. This will be corrected in the final EIS.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
			President’ is incorrect and should be changed to say, ‘Regional Director’.		
AD-15	ECCC	Sections 5.3.4 (Table 5.3-3); 8.1.3.3 Climate Change; 8.1.3.4 Climate Change Influenced Extreme Events; Table 15.4-1: Summary of Potential Effects of Short-term Extreme Weather Events on the Project and Associated Mitigation; Section 15.5 Climate Change.	<p>The Proponent indicates that the Project’s full lifetime is roughly 40 years (including the post-decommissioning phase) and that climate conditions are important design considerations for a number of sensitive aspects of the Project. Potential future climate changes and their potential effects on the Project and Valued Components (VCs) are described in various sections of the draft EIS. Notably, in Section 15.5.2, ensemble mean projections are provided for several climate variables for two future time periods and emissions scenarios (RCP 4.5 and 8.5). In Section 8.1.3.4, the Proponent describes possible future changes in short-duration precipitation extremes (based on Intensity Duration Frequency or IDF curves from the IDF_CC tool) and indicates that an increase in their frequency and magnitude may occur over the Project lifetime “... and may require consideration for greater storage and conveyance capacity for Project water management infrastructure” (p.8-41).</p> <p>The Proponent indicates that aspects of the Project are being designed to meet standards based on design values that appear to be derived from observed (i.e. historical) climate conditions (e.g. water management infrastructure; see Table 15.4-1). In Section 15.5.3, they indicate that an adaptive management approach will be used to address some aspects of future climate change as necessary. For example, page 15-19 of the draft EIS states that: “Denison will develop an Emergency Preparedness and Response Program for the Project to address forest fires and extreme weather that may occur. If unforeseen effects on the Project occur from longer and more severe forest fire seasons associated with climate change, or increased frequency or severity of extreme weather (e.g., ice storms, snowstorms, flooding), Denison will apply adaptive management that includes monitoring <b>climate factors so that they can proactively mitigate or prevent adverse climate effects on the Project.</b>” (Emphasis added).</p>	<p>ECCC recommends that when considering potential future climate change and relevant effects on the Project, the Proponent consider the range of variability from the ensemble of models (not just the ensemble mean). ECCC also recommends that the Proponent consult the 2019 Canadian Standards Association Guidance on Intensity Duration Frequency for Canadian Water Resources practitioners , which provides examples of alternative methodologies to estimate future return values for design as needed.</p> <p>In terms of adaptive management, ECCC recommends that the Proponent clearly outline what climate factors will be monitored to mitigate or prevent adverse climate-related effects. This should include information on when and how the climate factors would be monitored and under what circumstances particular adaptive management approaches would be applied.</p>	<p>Please see response to IR-15, IR-103, IR-104, IR-235, and IR-236.</p> <p>The probable maximum precipitation (PMP) value of 493 mm selected for design of water management infrastructure, such as ponds, is similar to total annual precipitation (456 mm from Key Lake station, and 483 mm from 1981-2020 climate normals).</p> <p>The selected PMP is well above (&gt;5 times higher): 1) current/measured 24-hour maximum precipitation, 2) modelled 1 in 100 year 24-hour return for current conditions, 3) modelled 1:100 year 24 hour return for a future (2020-2050) period, 4) the predicted maximum 1-day precipitation under different emissions scenarios for the future (including RCP8.5 in the 2021-2050 period).</p> <p>For comparison to the <b>design PMP of 493 mm</b>:</p> <ul style="list-style-type: none"><li>- the measured maximum 24-hour precipitation from Key Lake station was <b>42.9 mm</b> and <b>72 mm</b> from 1981-2020 climate normals.</li><li>- the modelled existing/current 1 in 100 year, 24 hour return using the IDF_CC Tool for the Wheeler River Project site was <b>79.9 mm</b> and at the Key Lake area was <b>56.4 mm</b>.</li><li>- the modelled future (2020-2050) climate 1 in 100 year, 24 hour return using the IDF_CC Tool for the Wheeler River Project site was <b>88.6 mm</b> and at the Key Lake area was <b>62.0 mm</b>.</li><li>- the predicted future climate (2021-2050) under the highest CO2e emissions scenario (RCP 8.5) shows maximum 1-day precipitation of <b>25.9 mm</b>.</li></ul> <p>The PMP is much higher (&gt; 5 times higher) than the observed and predicted 24-hour maximum precipitation and the 1:100 year 24 hour return. Completing the design using a large PMP provides confidence that the water management infrastructure will be sufficient and function under future climates as it relates to potential changes in precipitation.</p>
AD-16	CNSC	Section 5.10 (p.70) and throughout the EIS	<p>In section 5.10 of the ES, where the seven scenarios are listed, formatting is inconsistent. Likelihood is in quotes in some places, but not in all.</p> <p><b>Not significant</b> is bolded inconsistently throughout the EIS.</p> <p>As well, in many cases noted as “not significant”, where others note “are not expected to have a significant effect”.</p>	<p>Suggest making formatting consistent if going to use quotes and bolding to highlight sections of the text.</p> <p>Also, validate that use of “not significant” and “are not expected to have a significant effect” are consistently used (where appropriate).</p>	<p>Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-17	ECCC	Appendix 6-A Air Quality Technical Supporting Document A.10	Some of the off-road vehicles have an emission rating of Tier 2 but in Appendix 6-A Section A.10 the Proponent claims that “for non-road diesel combustion, Tier 4 emission factors were assumed”. Choosing an engine with a lower Tier will increase emissions in NOx significantly and the Proponent should be using the best available technologies to minimize environmental impacts.	ECCC recommends that the Proponent choose engines that meet the most stringent emission standards to the extent possible, which are Tier 4 for the compression-ignition engines, during all phases of the Project.	Please see response to IR-139.
AD-18	ECCC	Appendix 6-C, Climate Baseline and GHG Emissions Report	<p>Understanding Project emissions is important to inform analysis of a Project’s potential impact on Canada’s emissions targets and climate change commitments.</p> <p>ECCC notes that Section 4.0 and Appendix C: Greenhouse Gas Emissions Calculations of Appendix 6-C identifies the source of emissions and quantifies them in the construction, operation, and decommissioning phases of the Project, in accordance with the Draft Technical Guide Related to the SACC (Draft Technical Guide). While ECCC recognizes that the emissions will be relatively small in the post-decommissioning phase, the identification and quantification of the emissions in this phase is not found in the draft Environmental Impact Statement (EIS). The post- decommissioning phase is expected to last 15 years, likely going past 2050.</p> <p>The draft EIS does not discuss emission intensities of the Project, only the grid electricity. The draft EIS also does not discuss the Project’s potential impacts on Canada’s climate targets.</p>	<p>ECCC recommends that the identification of the sources of Greenhouse Gas (GHG) emissions and quantification of these emissions be described for the post-decommissioning phase, as done for the other phases.</p> <p>ECCC recommends the Proponent include discussion on the emission intensities of the mining of the product, following the guidance of the SACC and the Draft Technical Guide.</p> <p>ECCC recommends that the Proponent discuss the potential impacts that the Project may have on Canada’s ability to meet its climate-related targets, following the guidance of the SACC and the Draft Technical Guide.</p>	<p>The Post-Decommissioning phase only includes monitoring (physical, chemical, and biological) and regulatory site inspections. These activities are not expected to generate any significant GHG releases. Notwithstanding, the calculated GHG emissions estimates for Construction, Operation and Decommissioning are expected to be sufficiently conservative to capture any incidental GHG releases during monitoring and inspection activities.</p> <p>The EIS anticipated an annual average production rate of approximately 4,082 metric tonnes of U<sub>3</sub>O<sub>8</sub> and an annual net GHG releases of 30,702 metric tonnes CO<sub>2</sub>e over the operations phase of the project. The annualized GHG intensity during operations is estimated at 7.5 tonnes of CO<sub>2</sub>e / tonnes of U<sub>3</sub>O<sub>8</sub>.</p> <p>Section 2.5 of the EIS provides a summary of the anticipated GHG releases and a comparison to the nation- and province-wide GHG emissions. The project is expected to contribute less than 0.0043% to the nation-wide annual average. Given this very low contribution, the project is not expected to impact Canada’s ability to meet its climate-related objectives and targets.</p> <p>Also see response for AD-19 (second paragraph).</p>
AD-19	ECCC	Appendix 6-C, Climate Baseline and GHG Emissions Report	<p>The draft EIS lacks information related to estimates of impact on carbon sinks and emissions from land-use changes. As land use shifts from a vegetated site prior to development, to an industrialized site, removal of vegetation and peat will have impacts on carbon sinks and construction emissions.</p> <p>Section 6, Appendix 6-C, 4.1.2 Land Use Change states that site-specific information of above-ground mass of vegetation was not available and default data from Table 20 of the Draft Technical Guide were applied. The default data is contained in this table is not applicable in this case, as they represent aboveground woody vegetation in cropland systems.</p> <p>ECCC recognizes that the usage of the median value of 0.51 for the carbon content is reasonable.</p> <p>From the information given in the draft EIS, it does not seem that the soil carbon was taken into account. In the absence of detailed information, the Proponent assumed that the area cleared would also be excavated (and drained in the case of wetland areas) which</p>	<p>Land Use Change</p> <p>Regarding the lack of site-specific information of above-ground mass of vegetation, an initial site survey on-site using basic information such as site class and species would assist in determining the above-ground biomass. More specific data, such as regional data from provinces, forest companies, or literature may be available, and generic national data is available (e.g., Fo148-1-2E.pdf (publications.gc.ca), 4775.pdf (nrcan.gc.ca)).</p> <p>ECCC recommends that the Proponent also consider biomass that are not aboveground and confirm whether soil carbon is taken into account, as well as wetlands.</p> <p><i>Carbon Sinks</i></p> <p>ECCC recommends that the Proponent provide a quantitative and qualitative description of the Project’s impact on carbon sinks, following the guidance of the SACC and the Draft Technical Guide.</p>	<p>Limited site-specific data were available to characterize land use change and impacts on carbon sinks. As such, the use of default values from the SACC/IPCC in conjunction with some limited habitat/vegetation data (extracted from Chapter 9.2 Terrestrial Environment – Vegetation and Ecosystems, Listed Plant Species and Wetlands) was employed and is considered reasonable at this stage of the assessment. Please note that additional information on the land use change GHG calculations can be found in Appendix 6-C Climate Baseline and Greenhouse Gas Emissions Report.</p> <p>In accordance with our discussions with the CNSC, Denison is committed to re-assessing the GHG and climate change components of the EIS and other elements of the SACC once more detailed, site-specific data becomes available (i.e., detailed feasibility and engineering studies). This is expected to include more detailed study around overall GHG emissions, carbon sinks and mitigation options, best available technologies / best environmental practices, climate resiliency, net-zero carbon planning and offsetting.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
			would create significant additional emissions from soil disturbances and drainage.  Section 4.1.2 also states the Project involves clearing an area of approximately 169.6 hectares. There are no estimates on the impact on carbon sinks related to the Project.		
AD-20	NRCan	Section 7.3.1, Physical Geography	Drumlins and eskers in the region trend Northeast to Southwest as opposed to northwest to southeast as written on page 7, line 18. Correct orientations are used on page 7, line 23.	NRCan recommends revising the text. Please refer to 250 000 scale Surficial Geology Lines from Quaternary mapping, CSRS NAD83 Zone 13, Saskatchewan Geological Survey 2017.	Acknowledged. The typo in the draft EIS, Section 7.3.1 will be corrected in the final EIS. In Section 7.3.1. the text will be updated to say the following: “The most important associated topographic features in the region are the northeast to southwest trending drumlins and eskers...” See also response to IR-54.
AD-21	NRCan	Section 7.3.2.3, Metacrystalline Basement Rock	Pegmatite missing from list of basement rock types.	NRCan suggests addition of pegmatite to the list of basement tock types as shown on Figure 7.3-6.	Denison will update the final EIS per NRCan’s suggestion.
AD-22	NRCan	Section 7.3.3.1, Aquifer Properties, Section 7.3.2.3, Metacrystalline Basement Rock, Appendix 7A, 2.0, 2.3.1, 2.3.2	The terms “metacrystalline” and “metagranitic gneiss” are not frequently used terms in scientific literature. Gneiss is, by definition, a metamorphic rock.	NRCan suggests revision to “Crystalline Basement rocks” or “Basement metamorphic rocks”, and “granitic gneiss” as used in Figure 7.3-6. Please refer to Oxford Dictionary of Earth Sciences.	Denison will update the final EIS per NRCan’s suggestion.
AD-23	NRCan	Appendix 7A, 2.3.1, Metacrystalline basement rock	Orogeny is the process, orogen (or orogenic belt) is the feature produced by orogeny.	NRCan suggests replacing “Tran Hudson Orogeny” with Trans Hudson Orogen”.	Denison will update the final EIS per NRCan’s suggestion.
AD-24	NRCan	Appendix 7A, 2.3.1, Metacrystalline basement rock	Quartzite is by definition a metamorphic rock, and the term is used later without the meta-prefix.	NRCan suggests replacement of the term “meta-quartzite” with “quartzite”.	Denison will update the final EIS per NRCan’s suggestion.
AD-25	NRCan	Appendix 7A, 2.3.4, Athabasca Group Sandstones and Conglomerates	Sands are unlithified, whereas you are referring to grain sizes in this case.	In Table 2-1, NRCan suggests replacing the term “sands” with “grain sizes” under MFc and MFb descriptions.	Denison will update the final EIS per NRCan’s suggestion.
AD-26	NRCan	Appendix 7A, 2.3.5, Overburden	Typo on page 2, line 7: “A grain size sample was collected in GWR-033 from approximately 9 m below ground surface, and the same consisted of 8.8% clay (less than 4 µm).	NRCan suggests revision of “same” to “sample” and clay to “clay-sized” grains.	Denison will update the final EIS per NRCan’s suggestion.
AD-27	CNSC	Section 8.2.1.3 – Spatial and Temporal Boundaries	It is noted that McGowan Lake is an identified reference lake for the Key Lake Mill site. With the establishment of the Wheeler River mine, effluent would be flowing into McGowan Lake, which could potentially interfere with Key Lake’s environmental monitoring program by compromising McGowan Lake’s baseline conditions.	The CNSC advises Denison to communicate with Cameco to ensure they are aware of this situation. Coordination between the two companies may be necessary to ensure Key Lakes environmental monitoring program is not compromised. It is recommended to	Denison will communicate with Cameco through the Saskatchewan Mining Association to highlight the timing of the start of the Project as it may relate to Cameco's use of regional lakes for reference lake purposes. McGowan Lake will no longer be suitable as a reference lake for Cameco once the Wheeler River Project starts operating,

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
			Depending on the loading of COPC’s into McGowan Lake and resultant water concentrations, it may no longer be accepted as an acceptable reference lake for use by Key Lake. This would require Cameco to modify their monitoring program at the Key Lake Mill.	discuss this potential issue with Cameco ahead of time to determine the best path forward.	since it will be downstream of treated effluent release. Alpha Lake (LA-9 in Denison's aquatic baseline studies) will likely be outside of any influence from Denison's activities.  Please note that Denison has previously been in communication with the Saskatchewan Ministry of Environment, Environmental Protection Branch regarding the baseline study work Denison completed as part of the Environmental Assessment process and the potential changes to McGowan lake (a Cameco's reference lake) from the proposed Wheeler Project. Reference: Email from Janna Switzer (Denison) to George Bihun (MOE) on May 12, 2020.
AD-28	ECCC	Section 8.2.4.2.3  Appendix 10-A, Section 3.1.1.2	<p>Tables 8.2-9 and 8.2-10 in Section 8.2.4.2.3 Part II_S8 Aquatic Environment and Table 3-1 in Appendix 10-A Section 3.1.1.2 demonstrate predicted maximum effluent concentrations of Constituents of Potential Concern (COPCs) and maximum predicted receiving environment concentrations.</p> <p>The final effluent quality discharge target for uranium is 0.057 mg/L. However, the Canadian Council of Ministers of the Environment (CCME) water short-term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guideline, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe. While uranium is not a Schedule 4 substance with prescribed concentration limits under the Metal and Diamond Mining Effluent Regulations (MDMER), the MDMER requires the characterization of uranium concentrations in effluent under Schedule 5, and requires that all mine effluent released from final discharge points be non-acutely lethal.</p> <p>Under Schedule 5 Section 9(d) of the MDMER, the Proponent will likely be required to conduct selenium fish tissue sampling if average annual concentrations of selenium in effluent equals or exceeds 5 ug/L.</p>	Discharges from the proposed Project will alter water quality in the immediate receiving area, and this may include some sublethal effects on aquatic biota, which must be minimized. It remains the Proponent’s responsibility to adhere to the MDMER to ensure that effluent at the end-of-pipe from all final discharge points be non-acutely lethal and meet requirements for prescribed deleterious substances under Schedule 4 of the regulations.	Denison fully understands its obligations with respect to the MDMER and will comply with the MDMER end of pipe effluent discharge criteria.
AD-29	CNSC	Section 8.3.3  Figures 8.3.5 etc. 8.5-4	It does not appear that aquatic baseline sampling maps for Russell Lake have LAB 1 and 2 locations showing the baseline sampling locations within Russell Lake. (Figures 8.3.5). Please update the Figures throughout aquatic environment section to include of the baseline sampling studies/ locations within Russell Lake.	Please update maps and sections in EIS to reflect aquatic baseline studies that were completed.	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.
AD-30	CNSC	EIS sections 8.4.3.2.4 Benthic Invertebrate Community and 8.4.7.6 Climate Change Considerations	ECCC EEM guidance recommends the use of multiple reference areas as it offers the greatest statistical power to detect a meaningful difference between a reference area and an exposure area and can also give an indication of variability among reference areas. It is also important to incorporate multiple reference locations into the study design to aid in designing against spatial confounding factors.	Considering climate change may change the lake conditions from baseline conditions, and that there is already natural variability between lakes that will be used as reference lakes and exposure lakes, it could become difficult to show changes to sediment/benthic invertebrates are not due to project activities, therefore there is a recommendation to ensure the current baseline	Changes in landscape influence and lake conditions are not limited to those brought about by climate change. The preparation of a study design under the MDMER EEM program strives to ensure that a single reference area or multiple reference areas are as representative of a control condition as possible. Best practice is to undertake an analysis of candidate reference areas using the existing baseline information and investigate their utility as controls

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
			<p>Section 3 of the Aquatic Environment Baseline Study Report details the similarities between benthic invertebrate communities by using the mean Bray-Curtis index between sampling locations and the median reference condition for the lake group size. It's not clear in the EIS if there are any issues expected to be able to use this data to compare project effect locations to references sites into the future, as some sampling locations are currently not very similar to the reference sites.</p> <p>In addition, climate change could affect the sediment and benthic communities in the future. The EIS states “the frequency and magnitude of extreme precipitation events have the potential to change water levels and flows in the RSA, which may affect sediment transport, deposition, and therefore benthic invertebrate habitat. Changes to average and upper and lower bounds of ambient temperatures may also affect aquatic habitat, which in turn may affect benthic invertebrate communities. Climate change over the life of the Project (i.e., 35 to 40 years) will be monitored as part of the Project’s environmental monitoring programs, and influences on water quality, sediment quality, and benthic invertebrates will require adaptive management to mitigate any potential effects of the Project that may be exacerbated by climate-related changes on the aquatic environment”. It is recommended to ensure that appropriate number/location of reference sites are sampled to enable any changes to sediment or benthic invertebrate communities that may be due to climate changes, and not project effects, are able to be assessed.</p>	<p>data is adequate, and to consider if additional data, and addition of additional reference stations, will be needed moving forward.</p>	<p>prior to project development. A preliminary EEM study can be completed that will allow for a Before-After-Control-Impact study design, that will provide the ability to monitor change not only in the exposure areas, but in the reference areas, thereby allowing for a reasonable assessment of potential mine related impacts.</p>
AD-31	CNSC	Section 8.4.6.1, Residual Effects Characterization	<p>The EIS states “Local Indigenous communities have expressed direct concern with respect to mercury. Mercury has not been identified as a COPC for the Project as it is currently not present in the receiving environment (i.e., background condition) at detectable concentrations and will not be produced as part of the mine process; therefore, it will not be discharged to the aquatic environment. However, it is understood that potential nutrient enrichment-related effects are possible and can be linked to increases in mercury in the environment.” Based off concerns from Indigenous communities, and the fact that phosphate is a COPC in the effluent, and elevated concentrations of mercury were measured near the Kratchkowsky Lake bottom, adding methylmercury to the environment sampling plans may be beneficial.</p>	<p>Please consider adding methylmercury to the environment sampling plans (such as fish dorsal muscle) in order to confirm there are no unexpected effects of the project on levels, and to satisfy stakeholder concerns.</p>	<p>Refer to response to IR-100.</p>
AD-32	CNSC	Section 9.1.8.3, Appendix 10-A (ERA) section 3.2.1.5	<p>It appears there is no consistency between the assessment of soil quality in the ERA and the baseline soil sampling program presented in the EIS. The baseline program includes 10 soil permanent sampling locations (Appendix 9-B, section 2.5). Sampling at these</p>	<p>Please clarify how baseline measured data on COPC concentrations in soil is considered in the current and future iterations of the ERA.</p>	<p>Baseline measured soil data were used in the ERA to characterize the existing environment. The IMPACT model was used to predict the Project contributions for the Project phases above baseline.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
			<p>locations is proposed to be continued during the Operation Phase, and monitoring data will be compiled and reported annually/periodically (EIS section 9.1.8.3).</p> <p>Conversely, the ERA estimates and predicts concentrations of COPC in soil based on atmospheric deposition. Furthermore, the location of ecological receptors in the ERA (Figure 5-2) is different from the permanent soil sampling plot locations (Appendix 9-B, Figure 2.5-1). It is unclear why measured baseline soil quality data were not discussed in the ERA and whether future monitoring data will be considered in the ERA to verify accuracy of predicted COPC concentrations</p>		<p>The baseline soil concentrations used in the model are provided in Section 3.5.1 and Table 3-8 of Appendix A in Appendix 10-A (ERA).</p> <p>The ERA will be revised according to the periodic review requirements in CSA N288.6-22 which will reflect ongoing data collected from monitoring programs.</p>
AD-33	CNSC	Section 9.3.3.1.2	<p>Indigenous knowledge is summarized with regard to moose, including:</p> <ul style="list-style-type: none"><li>• Calving sites close to the Wheeler River, with lots of muskeg in the area. A moose calving area is located in the Terrestrial RSA, southwest of the Project Area.</li><li>• A wildlife corridor is used by moose, running between Cree Lake (outside and to the west of the Terrestrial RSA) and Russel Lake (in the southern portion of the Terrestrial RSA).</li></ul> <p>It is unclear how this information is incorporated into the residual effects assessment.</p>	<p>Please clarify how Indigenous knowledge on moose calving sites and corridors in the RSA is incorporated into the residual effects assessment for the key indicator “moose”.</p>	<p>The sites identified by IK were explicitly considered in the impact assessment as indicated by their identification as overlapping with the Terrestrial RSA as noted in the question. However, the areas were not expressly discussed in the residual effects assessment because there is no anticipated spatial overlap of those areas with direct or indirect Project effects.</p> <p>The Indigenous Knowledge provided by ERFN and SVS (2022) identifies a moose calving site (Feature 1001-08) ~ 2 km southwest, and a wildlife corridor ~6 km south of the Project Area (as depicted in Figure 4. Map B, page 16 of ERFN and SVS 2022). Both areas are within the Terrestrial RSA but outside the Wildlife LSA. The reference to “Calving sites close to the Wheeler River...” refers to a broad area that is 45 km east of the Project Area, well beyond interactions with the Project Area.</p> <p>The presence of the areas identified through IK was acknowledged in Section 9.3.3.1.2 (Information from Indigenous Knowledge, Local Knowledge, and Engagement) in Part II, Sec. 9 of the Draft EIS. The assessment (Sec. 9.3.4.2) considered alteration and/or habitat loss at the LSA and RSA scale. Section 9.3.4.2.1 (pg. 9-210) summarizes the effects on moose habitat as follows: “Habitat alteration through sensory disturbance effects (such as noise, dust deposition, and artificial light) is expected to result in reduced habitat quality and effectiveness near Project components and infrastructure reaching beyond the Project Area into the Wildlife LSA....”</p> <p>Further, Sec. 9.3.6.2.1 (Alteration and/or Loss of Habitat, pg. 9-230) identifies that an area within a 500 m radius of the Project Area will be influenced by the Project and likely make the habitat within that area less suitable for use by moose. Therefore, the effects of the Project on moose calving have been appropriately assessed and are expected to be contained within the Wildlife LSA. That affected area</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
					does not overlap with the moose calving site or the wildlife corridor identified by IK.
AD-34	CNSC	Appendix 9-B	<p>Baseline studies for birds are restricted to short time frames in one year only, for example:</p> <ul style="list-style-type: none"><li>Breeding Songbird Point Count Call Survey (June 7 and 17, 2017)</li><li>Aerial Waterfowl and Raptor Stick Nest Survey (June 15 and 16, 2017)</li></ul> <p>The Canadian Wildlife Service (2022) recommends:</p> <ul style="list-style-type: none"><li>Consider the potential effects of projects on birds throughout the year and document the distribution and abundance of birds in all seasons. Some species may be under-represented in existing data bases due to temporally restricted periods of detectability.</li><li>Explicitly target species at risk and other focal species.</li><li>Conduct at least two years of field surveys as a national standard for major projects, so that temporal variability can be considered in future comparisons to baseline data.</li></ul> <p><b>Reference:</b> Canadian Wildlife Service. 2022. Guidance Regarding Data Needed to Support Assessment of Project Effects on Birds. Environment and Climate Change Canada, Gatineau, Quebec. 80 p.</p>	Please consider conducting surveys following CWS’s recommendations or provide an explanation as to how current baseline data for birds is sufficient to characterize the existing environment.	The data collected as part of the baseline studies for birds was focused on the habitat types and areas most likely to be disturbed as a result of the Project. Conducting additional baseline surveys for waterfowl, raptors, and breeding birds is not anticipated to result in changes to the assessment outcomes and predictions made as part of the effects assessment, which was habitat-based, for avian species. The assessment methods used a conservative approach with the assumption that following the implementation of site-specific mitigation measures, the proposed Project activities would have a residual effect on these species guilds regardless of species presence on site. However, to supplement the species data that were collected as part of the baseline field program, Denison is willing to acquire additional information on species presence in the RSA from existing sources, specifically from the Saskatchewan Breeding Bird Atlas (Birds Canada). However, collection and consideration of this information is not expected to affect the findings and/or conclusions stated in the draft EIS as the assessment was habitat-based to address all species.
AD-35	CNSC	Section 10, IMPACT MODEL	Denison discusses details of the IMPACT model but has not provided scenario(s) used to facilitate review.	Please consider providing CNSC with the IMPACT model scenario file(s) in the spirit of regulatory cooperation.	The intent of Appendix A to Appendix 10-A is to provide the inputs used for the IMPACT model as well as all of the characteristics for human and ecological receptors. Where site-specific data were not used in the model it can be assumed that default values from CSA N288.1-20 were used in the IMPACT model. As such, Denison does not intend to provide the scenario files.
AD-36	English River First Nation (ERFN)	Section 10.1.3.2, Traditional Foods Diet (p. 10-15)	<p>The EIS States: "The ERFN is comprised of seven reserve lands across Saskatchewan" (p. 10-15)</p> <p>While this is accurately reflecting a source document, the source document is incorrect.</p>	Please update to "The ERFN is comprised of seven historical settlements that have now grown into 19 different reserves across Saskatchewan"	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.
AD-37	CNSC	Section 10.1.9, Human Health Summary and Appendix 10-A – 4.4.1 Risk Estimation	The Human Health section of the EIS, as well as the ERA, indicates that there is an exceedance for selenium for the fisher/trapper receptor, with the Project estimated to contribute to the majority of this exceedance (0.93 of the HQ). While the assessment is conservative by assuming an increase intake rate of fish solely sourced from Russel Lake, the precautionary principle should be considered to ensure in reality the HQ for selenium remains below 1, even under conservative assumptions.	<p>Please conduct of effluent, water, and aquatic organism monitoring (as already suggested in EIS) to confirm HQ’s are highly conservative in the EIS modelling and receptors remain protected.</p> <p>Should it be determined Se concentrations are increasing in the environment at such a rate as there may be in impact to the environment or human health, installation of a selenium removal circuit into the effluent treatment process should be considered. The proponent should ensure that the proposed wastewater treatment system design incorporates the capability for expansion</p>	Denison acknowledges that a robust effluent and environmental monitoring program will be developed to confirm all EIS modelling predictions. The ERA will be revised according to the periodic review requirements in CSA N288.6-22 which will reflect ongoing data collected from monitoring programs.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
				or upgrades in alignment with the precautionary approach, pollution prevention, and continuous improvement.	
AD-38	CNSC	Appendix 10-A (ERA)	<p>It is unclear if measured or modelled COPC concentrations in blueberry were used in the calculations of human receptor dose. Similarly, it is unclear if measured or modelled COPC concentrations in lichen and blueberry were used in the calculations of ecological receptor dose.</p> <p>CSA N288.6-22, Clause 7.3.6 states that “Measured concentrations of COPCs should be used, where possible, in the exposure assessment.” Please see the Clause for further information.</p>	Please clarify if measured or modelled COPC concentrations in blueberry / lichen were used in the calculations of human and ecological receptor dose.	Measured baseline lichen data were used in the ERA to characterize the existing environment. The IMPACT model was used to predict the Project contributions for the Project phases above baseline. Measured baseline blueberry data were used for model calibration to determine if there was good agreement between measured data and modelled data. The IMPACT model was used to predict both baseline and Project contributions for blueberries. The ERA will be revised according to the periodic review requirements in CSA N288.6-22 which will reflect ongoing data collected from monitoring programs.
AD-39	CNSC	Appendix 10-A (ERA), Table 2-2	<p>Table 2-2: Estimated Home Ranges of Selected Terrestrial Ecological Receptors</p> <p>Based on the reference McLoughlin et al. (2016), the Home Range for Woodland Caribou is indicated as “Expected = 80 km2” which represents the mean range sizes pooled over the two study years for calving/post-calving. The indicated Minimum (67 km2) and Maximum (267 km2), however, do not relate to the calving/post-calving stage, which is not clearly stated in Table 2-2. In contrast, these values are actually mean range size values for autumn/rut and early winter, respectively, as described in the source document on Page 83 (McLoughlin et al., 2016). It should be noted that in terms of true minimum and maximum, the source document states that individual home ranges, based on up to two years of GPS locations, varied in size from 16.2 km2 to 1363.9 km2 (Page 82 of McLoughlin et al., 2016).</p> <p>Reference: McLoughlin et al. 2016. Population dynamics and critical habitat of woodland caribou in the Saskatchewan Boreal Shield. Interim Project Report, 2013–2016. Department of Biology, University of Saskatchewan, Saskatoon. 162 pp. Available online at <a href="http://mcloughlinlab.ca/lab/wp-content/uploads/2019/06/2013-2016-SK-Boreal-Shield-Caribou-Project-Interim-Report-Nov-18-2016.pdf">http://mcloughlinlab.ca/lab/wp-content/uploads/2019/06/2013-2016-SK-Boreal-Shield-Caribou-Project-Interim-Report-Nov-18-2016.pdf</a></p>	Please provide clear details on the source of the home range values listed in Table 2-2.	Denison acknowledges the comment and will add clarification in Table 2-2 of Appendix A in Appendix 10-A that the minimum represents the autumn/rut and the maximum represents the early winter.
AD-40	CNSC	Appendix 10-A (ERA) section 3.2.1.5	Although the soil type selected in the ERA for modeling of atmospheric deposition to soil is sandy soil, organic soils have been delineated and characterized (section 9.1.3.3 of the EIS) as valued component (i.e., “Organic Matter/Peat”). It is unclear if the soil quality modeling performed in the ERA is protective for soil types other than sandy soil.	Please clarify if COPC modeling based on sandy soil is protective of organic/peaty soil and provide justification.	The majority of the soil in the Project Area and LSA is considered sandy soil. Section 9.1.3.2 of the EIS states "Mineral soils are associated with upland sites and (in all likelihood) anthropogenically disturbed land that, together, correspond with >99% of the Project Area and 91.5% of the LSA (Figure 9.1-8). The predominate mineral soils within the RSA have been classified as Sandy Dystric Brunisols (Smith et al. 2011)." Organic matter/peat was included as a VC in the EIS because of the concern regarding drying and losing biological function through groundwater interactions, and not in

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
					terms of assessment of soil quality. Additionally, Section 9.1.3.3 of the EIS acknowledges that organic soils is limited in the Project Area. As such, this comment is considered not applicable.
AD-41	CNSC	Appendix 10-A (ERA), Table 5-5	<p>Table 5-5: Complete Exposure Pathways for All Selected Ecological Receptors to be Assessed using the IMPACT Model</p> <p>The exposure pathway for phytoplankton is stated as “direct contact in sediment”, however, phytoplankton live suspended in the water column. It is acknowledged that in the IMPACT modelling report, phytoplankton is described with an occupancy factor of 1 in water (Table 2-5).</p>	Please add the pathway “direct contact in water” to Table 5-5 and revise all calculations accordingly.	Table 5-5 will be revised to state “direct contact in water” for phytoplankton. No calculation changes are needed.
AD-42	CNSC	Appendix 10-A (ERA), Table B.12	<p>Table B.12: Sample Calculation – Adult Recreational Fisher/Hunter (McGowan Lake) Dose and Risk Calculations for Selenium</p> <p>The source for the Terrestrial Plant Ingestion Dose for Labrador tea and blueberry is stated as “Table C.5”, however, this table could not be located.</p>	Please provide the referred-to Table C.5 or an alternate source of information for the Terrestrial Plant Ingestion Dose for Labrador tea and blueberry.	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.
AD-43	CNSC	Appendix 10-A (ERA), Environmental Risk Assessment for Wheeler River Technical Support Document	<p>The ERA is prepared by Ecometrix and submitted to Denison Mines. It is unclear if the ERA submitted has been reviewed and accepted by the proponent (Denison Mines).</p> <p>CSA N286-12 clause 9.5.5 specifies that “the selected supplier’s technical documents that are required to be submitted shall be reviewed and accepted”.</p> <p>Meeting these CSA N286-12 requirements will ensure that the proponent has control of the purchased services as a future licensee applicant.</p>	Provide clarifications if ERA documents have been reviewed and accepted by the proponent.	See response to IR-202 which indicates that Denison reviewed and accepted the ERA. This text will be added to Appendix 10-A.
AD-44	CNSC	Section 11	It is not clear whether all of the interested Indigenous Nations and communities were engaged on the results and findings of the Heritage Resources Impact Assessments (HHRIA) or just ERFN?	CNSC staff would appreciate an update on any engagement activities that have taken place with regards to any of the HHRIAs for the Project, or any site or thing that is of historical, archaeological, paleontological or architectural significance as requested by other Indigenous Nations and communities to date.	<p>Denison confirms that the results of the Project-related HRIAs were discussed with ERFN, as they expressed interest in further understanding the nature of the work undertaken.</p> <p>The Saskatchewan Ministry of Parks, Culture and Sport, Heritage Conservation Branch (HCB) administers The Heritage Property Act. Regulatory approval as per section 63 of The Heritage Property Act (GS 80) was granted for the Project for the two separate HRIAs (HCB File No. 16-2102, December 14, 2017 and HCB File No. 19-933 February 12th, 2020).</p> <p>The results of the HRIAs were included and formed part of the draft EIS. Comments made by Indigenous communities on this section of the EIS will therefore be responded to accordingly by Denison, where appropriate.</p> <p>Additionally, as noted in Section 11.3.2, “The Heritage Resource</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
					Management Plan (HRMP) was informed by engagement with ERFN, who recommended that the HRMP should include a mechanism to involve Indigenous communities where appropriate (21-EN-ERFN-591.1; 21-EN-ERFN-591.2) (see Appendix 11-B).”  The mechanism to involve Indigenous communities has been included in the HRMP and allows for general notification to Indigenous communities should an artefact be found, which provides flexibility to engage all appropriate Indigenous nations accordingly.
AD-45	CNSC	Section 11.1.4.5.2. Perceived Suitability/Safe Use of Resources (p. 11-59)	The EIS States: “Section 2.6.1 in Section 2 describes the extensive review of mining methods that led to the decision to adopt the ISR mining method.” (p. 11-59).  This reference is not correct, as this section does not contain a review of the mining methods.	Please update this to reflect the appropriate section.	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.
AD-46	TC	Section 14.6.7.2	Transport Canada would like to clarify that although the proponent may use a third party to assist in developing emergency response assistance plans (ERAPs), it is the proponent’s responsibility to submit the ERAP application(s) to Transport Canada, per Section 7(1) of the <i>Transportation of Dangerous Goods Act, 1992</i> as follows:  Emergency response assistance plan  7 (1) No person shall import, offer for transport, handle or transport dangerous goods in a quantity or concentration that is specified by regulation — or that is within a range of quantities or concentrations that is specified by regulation — unless the person has an emergency response assistance plan that is approved under this section before (a) importing the dangerous goods; (b) offering the dangerous goods for transport; or (c) handling or transporting the dangerous goods, in the case where no other person is required to have an emergency response assistance plan under paragraph (a) or (b) in respect of that handling or transporting.	*This advice pertains to the regulatory phase.*  Transport Canada notes that the sentence highlighted in yellow below is incorrect and should be revised or removed. While a contractor could assist the proponent to develop the ERAP(s), it is the responsibility of the proponent to apply to Transport Canada for approval of the plan(s).  14.6.7.2 Design and Mitigation Considerations  Principal traffic risk mitigation measures include: <ul style="list-style-type: none"><li>• traffic control measures such as speed limits;</li><li>• travel management plans;</li><li>• spill and emergency response planning; and</li><li>• driver training.</li></ul> Additionally, Denison considered several provisions to make sure that the effects of a terrestrial release of hazardous materials are as low as practicable. In addition to transportation mitigations listed for Scenarios 1 and 2, the following provisions were considered.  • The <i>Transportation of Dangerous Goods Act, 1992</i> (Government of Canada 2019) outlines the requirements for entities that transport dangerous goods to establish emergency response assistance plans. These plans list specialized personnel and equipment that are required for responding to an incident. It is expected that a contractor responsible for the transportation of uranium concentrate, fuel, and hazardous chemicals would develop these plans.	Acknowledged. Section 14 will be updated in the final EIS to clearly state that while a contractor could assist Denison to develop the ERAP(s), it is Denison’s responsibility to apply to Transport Canada for approval of the plan(s).

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>3</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-47	Health Canada (HC)	Appendix 14-A (p. 8-9)	<p><b>Context:</b> No emergency response plan has been provided within the draft EIS, which states that emergency response plans will be developed in the future (Section 14 Appendix 14-A, p.8-9).</p> <p><b>Rationale:</b> For any emergency event, Health Canada considers the protection of human health as a primary consideration in the development of emergency preparedness and response plans. This includes monitoring for human health impacts and the provision of health-related guidance. Further, this will be a requirement of the licensing process.</p> <p>The proponent should ensure that the emergency response plans consider the protection of all relevant potential human receptors that could be impacted by an onsite or project-related off-site accident involving the release of chemical and/or radiological substances.</p>	<p>It is recommended that Denison develop an emergency response plan in consultation with potentially affected communities and stakeholders that includes, but is not limited to, the following:</p> <ol style="list-style-type: none"><li>1. All relevant contact information of the communities, especially related to km 160 of Hwy 914, which is the location of a cultural camp that has been established by the English River First Nation and km 67 of Hwy 914 that is a gathering location for the Kineepik Metis Local associated with the Northern Village of Pinehouse.</li><li>2. Description of the mechanisms for communication with communities in case of an emergency.</li><li>3. Description of the partnership with and the training of local communities and local responders (see Section 14 Appendix 14-B, p.1).</li><li>4. Description of mutual aid agreements with neighboring industries/municipalities, where appropriate.</li></ol>	<p>Denison acknowledges the comment and thanks Health Canada for the recommendations as to the development of its Emergency Response Plan.</p> <p>As noted in the draft EIS, Denison has committed to the development of an Emergency Preparedness and Response Program as a component of its Environmental Management System (EMS). The objectives of the program are generically consistent with the recommendations that have been provided and Denison, as it has demonstrated to date, is committed to meaningful engagement with communities of interest and will solicit input and advice during all aspects of program development.</p> <p>For reference it is noted that as it concerns its EMS framework documentation hierarchy it is expected that three levels of documentation will be developed – Programs, Plans and Procedures. The emergency preparedness and response documentation will follow this hierarchy and input from interested parties will be solicited during all phase of program/plan/procedure development. Denison intends to develop this documentation as it advances through the licensing phase of Project realization.</p>
AD-48	ECCC	Appendix 16-C, Summary of Monitoring and Follow-up Programs	Appendix 16-C does not include consideration of any monitoring and follow-up programs regarding GHGs.	ECCC recommends that the Proponent consider developing a GHG follow-up program to measure and compare actual GHG emissions against the draft EIS estimates, including reporting the Project’s actual emissions and updating the emissions estimates as needed.	Denison anticipates being subject to ECCC’s reporting requirements for emitters over 10,000 tonnes CO2e and the information is collected under section 26 of the Canadian Environmental Protection Act. This was noted in the draft EIS, Section 2.5 Greenhouse Gas Emissions.
AD-49	ECCC	Appendix 16-A Summary of Residual Effects  Appendix 16-B Summary of Cumulative Effects	ECCC notes that GHG mitigation measures have not been considered for the Project. Furthermore, the Project’s lifetime is expected to extend into 2050 and beyond. Consistent with the information requirements of the SACC, and aligning with Canada’s commitment to achieve net-zero GHG emissions by 2050, the Proponent should provide a credible plan that describes how the Project will achieve net-zero emissions by 2050.	<p>ECCC recommends that the draft EIS include an assessment of potential GHG mitigation measures throughout all phases of the Project. This could include a Best Available Technologies / Best Environmental Practices (BAT/BEP) Determination, as described in Section 3.2 of the Draft Technical Guide.</p> <p>ECCC also recommends that the Proponent provide a credible Net-Zero Plan on how to achieve the target of 0 kt CO2 eq/year, for the year 2050 and beyond, following the guidance of the SACC and the Draft Technical Guide.</p>	<p>GHGs were not included as a VC or KI in the draft EIS and as such, there are no specific GHG-related mitigation measures in Appendix 16. However, many of the mitigation measures for the VC Air Quality related to combustion products would also be associated with a reduction in the Project’s Scope 1 emissions. As noted in the draft EIS, Section 2.5, at this stage in the Project Denison will look for opportunities to optimize energy management and improve the energy intensity of the Project where practical. Also see response for AD-19 (second paragraph).</p> <p>Denison will consider the option of preparing a climate resiliency assessment with consideration to best available technologies / environmental practices (BAT/BEP) as well as a net-zero plan as the Project advances. Section 2.5 of the EIS provides a summary of the anticipated GHG releases and a comparison to the nation- and province-wide GHG emissions. The project is expected to contribute less than 0.0043% to the nation-wide annual average. Given this very low contribution, the project is not expected to impact Canada’s ability to meet its climate-related objectives and targets.</p>

Annex 6

Federal Indigenous Review Team (FIRT) Review of Denison Responses to Information Requests (IRs) and Supporting Documents Received February 10, 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-01	-	English River First Nation (ERFN)	Current use of lands and resources for traditional purposes	General	<p><b>Context:</b> Denison has not gone far enough in terms of learning from and incorporating information from ERFN provided in the <i>Traditional Knowledge Study and Health and Socio-Economic Study Report</i>. It appears Denison put a disproportionate amount of reliance on the views and interests of one ERFN land user. While we applaud the efforts of Denison to seek feedback from ERFN land users directly and to work closely with such land users, ERFN’s rights and interests in the region of the Project (and the potential of the Project to adversely impact such rights and interests) extend well beyond that of just one land user.</p> <p><b>Rationale:</b> It is important for the Proponent and regulators to understand that while the rights and interests of individual ERFN members are important to consider, the Elders and elected leaders of ERFN represent the collective rights and interests of ERFN as a Nation. The results of the scoping study indicated that ERFN holds firmly established rights to the area where the planned project is located. Numerous studies conducted over several decades have examined ERFN's relationship and connection to land use and occupancy of the region where the proposed mine is located from traditional land use, subsistence harvesting, ecological, and sociocultural and economic perspective.</p>	<p>The draft EIS should be revised to reflect the totality of ERFN TK and land use information.</p> <p>Denison and CNSC must continue to work with ERFN to ensure that impacts on ERFN rights are appropriately and fully considered, mitigated, and accommodated.</p>		Accepted	n/a
IR-02	-	Canadian Nuclear Safety Commission (CNSC)	Mitigation Measures	General  Appendix 16-C	<p><b>Context:</b> Denison’s 2019 Wheeler River Terms of Reference states: “The EIA will also discuss the monitoring programs required to demonstrate regulatory compliance and compliance with the commitments Denison has made to its Indigenous and non-Indigenous Stakeholders.”</p> <p>The CNSC’s <a href="#">Generic Guidelines for the Preparation of an Environmental Impact Statement (EIS)</a>, also state: “The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the Proponent intends to implement them and the environmental outcome the mitigation is designed to address.</p> <p><b>Rationale:</b> The EIS and the Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information. It is not clear which monitoring programs will be employed to demonstrate regulatory compliance, and compliance with the commitments Denison has made to its Indigenous and non-Indigenous Stakeholders.</p>	<p>CNSC staff expect Denison to provide a comprehensive list of commitments along with the next version of the EIS, including any commitments made to Indigenous Nations and communities and other stakeholders (As committed in the Wheeler River Terms of reference, and as noted in the November 28<sup>th</sup>, 2022 email from CNSC staff to Denison: <i>Future Submission of a Commitments Table for Wheeler River EIS</i>).</p>		Accepted	n/a
IR-03	-	CNSC	Site preparation	Section 1.3.2 Temporal Boundaries  Appendix 10-A (ERA)	<p><b>Context:</b> The EIS and TSD-ERA provide assessment on the Project timeframe, including construction, operation, and decommissioning phases.</p> <p><b>Rational:</b> The site preparation phase is not included in the timeframe (EIS and TSD-ERA). As per REGDOC 2.9.1, the sub-section 4.1.1 Complexity of the environmental risk assessment requirements states that “The applicant or Licensee shall identify facility characteristics and activities that may interact with the environment during</p>	<p>Please provide an assessment of those facility characteristics and activities that may interact with the environment during the site preparation phase, along with an assessment of their potential effects, in order to reflect the entire lifecycle or provide a rationale for its exclusion.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					the relevant phase of the facility or activity’s lifecycle (for example, site preparation, construction, operation, and decommissioning.”				
IR-04	-	Environment and Climate Change Canada (ECCC)	Fish and fish habitat	Section 2, Project Description Section: Glossary	<p><b>Context:</b> The Proponent defines ‘clean waste rock’ as “Waste rock generated as sandstone cuttings and core from drilling activities associated with well and freeze hole development that does not have uranium containing materials”.</p> <p>ECCC notes that the use of the term “Clean Waste Rock” could be misunderstood to mean that the waste rock is devoid of any contaminant. Even when the waste rock referred to as “clean waste rock” does not contain uranium materials, it could contain other metals or contaminants that could have adverse environmental effects. It is also not clear whether the “clean waste rock” is characterized for Acid Rock Drainage/Metal Leaching (ARD/ML) given that some portion of the basement rock is to be drilled out to anchor the freeze walls and may have ARD/ML potential.</p> <p><b>Rationale:</b> The current definition of ‘clean waste rock’ in the draft EIS could lead to inappropriate handling and disposal if it is assumed to be devoid of any metals or other contaminants that might negatively affect the environment.</p>	Provide a clear and more detailed definition of the term ‘clean waste rock’.		Accepted	n/a
IR-05	-	CNSC	Change to an environmental component due to hazardous contaminants	Section 2.2.1.2	<p><b>Context:</b> Water volumes for mud/diamond drilling is listed as minimal as the mud will be re-used. The mud is identified as a mixture of water, clay, and environmentally friendly polymers that clean out the cuttings and help to keep the drilling bit cool.</p> <p><b>Rationale:</b> Although the mud for drilling will be re-used, there could be environmental impacts should there be an accident while drilling.</p>	Please identify the components of the environmentally friendly polymers for the drilling mud and potential environmental impacts should the mud not be recovered.		Accepted	n/a
IR-06	-	CNSC	Geology and groundwater	Section 2.2.1.4, Wellfield for In Situ Recovery Mining	<p><b>Context:</b> This Section of the EIS indicates that a tracer test was completed in 2021 and a feasibility field test was initiated in 2022. No information from these tests is included in the EIS and no reporting timelines are provided.</p> <p><b>Rationale:</b> Guidance from the IAEA (2001) and best practices highlighted by regulatory regimes in other countries such as the United States (IAEA, 2016) and Australia (Geoscience Australia, 2010) indicates that single and multi-well trial (feasibility) testing for mining and remediation techniques should be carried out before a licence for full-scale operations can be granted. This is part of the requirement for Proponents to demonstrate to government authorities that all potential risks have been considered during the life of operation and post-remediation of the mine.</p> <p>Additionally, Section 8.5.2 of the Generic EIS Guidelines states: “Units may be characterized as aquifers or aquitards, and unit descriptions should include their geochemical characteristics, vertical and lateral permeabilities, transport mechanism (diffusion versus advection) and the directions of groundwater flow”,</p>	<p>1. Please provide a summary of the results of field tests (i.e., tracer tests, wellfield leach tests, and remediation trials) in the EIS, or provide a technical supporting document with this information, and ensure the documentation is appropriately referenced in the EIS.</p> <p>2. Please indicate how outcomes from these field tests inform the design of In Situ Recovery. This information should include:</p> <ul style="list-style-type: none"><li>feasibility of meeting remediation targets.</li><li>groundwater flow conditions and validation of flow models.</li><li>mobilization of contaminants (e.g., Al, Se or V).</li><li>potential for free gas evolution/two-phase flow.</li><li>identifying composition of lixiviant and production solutions.</li><li>success despite presence of &gt;2% carbonate minerals (siderite, FeCO3) in the ore zone (see Table 4-3 of Appendix 7-A).</li></ul>		Accepted	n/a

IR-07	-	ECCC	Fish and fish habitat	Section 2.2.1.4.2, Wellfield Operation  Section 2.2.1.4.2.2, Secondary Containment of Mining Solution – Pumping	<b>Context:</b> The description in Sections 2.2.1.4.2 and 2.2.1.4.2.2 refer to the differential rates of injection and withdrawal, which implies that more solution will be withdrawn through the recovery well than volume of mining solution injected. According to the description of the site, a freeze wall will create a barrier between the uranium deposit to be mined and outside the isolated area to prevent inflow of groundwater from the sandstone outside the freeze wall. Secondly, it was indicated that the basement rock below the uranium deposit will prevent infusion of groundwater from below.  The Proponent stated that inward hydraulic gradient will be created by recovering more solution than is being injected. In general, the wellfield will operate to draw a minimum of 1% more solution out of the wellfield compared to solutions injected in. This will help avoid increased subsurface pressures from injection pressure build up within the deposit.  <b>Rationale:</b> It is not clear where the extra groundwater will come from that will sustain this differential rate of injection and withdrawals as the freeze wall and bedrock basement will isolate the injection well from groundwater.  If it is assumed that there is limited amount of groundwater present in the sandstone layer above the uranium deposit, that amount of groundwater in the sandstone layer is finite and will be exhausted at some point. Therefore, it is not clear where the extra groundwater will come from. If the extra volume of water is not accounted for in the modelling, that would ultimately affect the volume of water that ends up in the receiving environment and likewise the amount of contaminants contained.	Clarify where the extra groundwater will come from to sustain this differential rate of injection and withdrawals during operation and if this extra water has been accounted for in the model and the amount of water that ends up in the receiving environment.		Accepted	n/a
IR-08	-	ECCC	Change to an environmental component due to radiological contaminants	Section 2.2.1.4.2.2 Project Description	<b>Context:</b> This section describes how an inward hydraulic gradient will be created within the mining area as a secondary containment method for control of mining solution. While the process is described, there is no information on contingency measures in place for pump failure or system maintenance solutions. There is also no information on how quickly the hydraulic gradient, and therefore secondary containment, would be compromised if any pumps stopped working. It is also unclear how primary containment (i.e., well design) failure, such as	Provide further information regarding how the inward hydraulic gradient system functions, with particular focus on how the hydraulic gradient and secondary containment will be maintained if any wells or pumps were compromised.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					physical/mechanical issues compromising casings, would affect the creation of the hydraulic gradient and secondary containment as well.  <b>Rationale:</b> It is important to have contingency planning in place in the event that there are any issues with the hydraulic gradient and secondary containment system for control of the acidic mining solution.  There is no information in this section on how the hydraulic gradient (i.e., secondary containment) would be maintained if a well or pump (i.e., Primary containment) experienced problems.				
IR-09	-	CNSC	Geology and Groundwater	Section 2.2.1.4.2.2	<b>Context:</b> This section indicates that mining solution within the mining area can primarily be controlled by maintaining an inward hydraulic gradient. The inward hydraulic gradient will be created by recovering more solution than is being injected.  <b>Rationale:</b> If, for some reason, the recovered solution is much more than that being injected, an excessive drawdown could be created. If, by accident, mining solution is leaking into the upper sandstone aquifer through crack in injection/recovery well casing at the same time, it would be challenging to remediate the upper sandstone aquifer in dry conditions (due to excessive drawdown).	Please clarify if any measure will be implemented to avoid excessive drawdown and develop contingency measures to address such accident.		Accepted	n/a
IR-10	-	ECCC	Fish and fish habitat	Section 2.2.1.4.2.3, Tertiary Containment of Mining Solution - Freeze Wall	<b>Context:</b> The Proponent stated that as a tertiary means of containment for the mining area, the uranium deposit is proposed to be surrounded by a freeze wall that extends from the surface to the basement rock, isolating the mining area from regional groundwater. Current plans are for the freeze wall to be a minimum of 10 m thick, be installed 25 m away from the uranium deposit, and extend 30 m into the basement rock (Figure 2.2-6).  As explained in Section 2.2.1.4.2.2, mining solution will be injected into the ore zone under pressure and will likely react, not just with the uranium in the ore zone, but also the binding or cementing material in the sandstone. This means that some portion of the sandstone above the uranium layer and perhaps some portions of the freeze wall will dissolve, thereby creating more void than just the thickness of the uranium layer or horizon. The void may affect the integrity of the freeze wall as containment.  <b>Rationale:</b> It is not clear how the Proponent will monitor the freeze wall to verify whether portions of the freeze wall are being dissolved in the mining process and how it plans to verify the integrity of the freeze wall as a containment for the mining solution. In addition, if the dissolution reaction of the uranium ore is exothermic, then the heat generated may also affect the integrity of the freeze wall.	1. Explain how the integrity of the freeze wall will be maintained as a means of containment that prevents migration of the mining solution out of the ore zone into the receiving environment.  2. Demonstrate that the mining solution injected under pressure will not compromise the integrity of the freeze wall as a containment.  3. Demonstrate how both exothermic and chemical reactions of the mining solution used to dissolve the uranium ore will not compromise the integrity of the freeze wall as a containment.  <b>Technical Discussion Required:</b> Yes. ECCC would like to better understand the chemical constituents that compose the mining solution and the chemical reactions that it will cause.	The Proponent’s response is accepted. Please also see AD-50 in the Advice to Proponent table.	Accepted	n/a
IR-11	-	ECCC	Change to an environmental component due	Section 2.2.3 Project Description	<b>Context:</b> It is unclear how much contact water may be produced during the drilling of the mine well field during the construction phase of the proposed Project. Figure 2.2-14 indicates that no water will be produced during the drilling process in the construction phase. In Section 2.2.1.2 both mud rotary drilling and diamond drilling	Provide further information on potential wastewater produced during the construction phase from drilling processes, and if proposed infrastructure can contain any water produced.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
			to hazardous contaminants		<p>are proposed for the creation of wells. Both processes require water, however only mud rotary drilling produces liquid mud that is then reused in the drilling process.</p> <p><b>Rationale:</b> It is unclear if the liquid mud produced during drilling can be reused indefinitely with further water additions, or if this eventually becomes the clean sand grain cutting and how it will be disposed of (i.e., liquid or solid waste). If the mud produced from drilling is classified as liquid waste and disposed of as contact water, it is not clear if this is accounted for in the site water management plan and water balance during the construction phase. Contact water from well drilling during the construction phase has not been quantified or accounted for in Figure 2.2-1, and therefore it is unclear if proposed infrastructure during the construction phase has the capacity to contain this waste stream in addition to the waste streams currently outlined in Figure 2.2-1.</p>				
IR-12	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 2.2.3, Project Description	<p><b>Context:</b> There is not enough information provided within the draft EIS and site water infrastructure designs to determine if the infrastructure will sufficiently contain mine site contact and non-contact water runoff. It is unclear how water management will occur during all proposed Project stages at the Project airstrip, which is located away from the main Project site. No information has been provided regarding water that may come into contact with fuels and oils from machinery on the air strip, how and where that contaminated water will be treated, and how surface runoff around the airstrip will be managed. Additionally, it is unclear if contaminants from heavy machinery on roads have been considered during runoff collection plans throughout the mine Project site. Water management at the airstrip and roads can have impacts on surface water quality and sediment quality and contaminants (e.g., Hydrocarbons) from these sources should be considered in overall site water management plans.</p> <p>In Section 2.2.3.1 a site drainage plan for contact and non-contact water has been provided in Figure 2.2-17, and water balances have been provided for the different Project phases in Figures 2.2-14 to 2.2-16. In Section 2.2.3.4 a volume of 30,000m3 for the process water pond is provided, and it is stated that the process water pond has the capacity to contain Probable Maximum Precipitation (PMP) event estimated to be 483.3mm while allowing for 1.0m of freeboard. However, there are no estimates on the total volume of water that may be drained from the overall site infrastructure (i.e., the well field, processing areas, etc.) during a 24-hr PMP event. Additionally, in Figure 2.2.17 culvert locations are provided, however there is no further information on culvert designs, flow ratings and capacity for PMP events.</p> <p><b>Rationale:</b> In order to be able to understand site water management and flood risk potential, more information needs to be provided regarding the site water infrastructure designs and capture volumes during PMP events. This information will aid ECCC in understanding how contact and non-contact water will be conveyed throughout the site. Runoff from roads and the site airstrip will contain contaminants from vehicles, heavy machinery, aircrafts and de-icing practices. Additional information on the runoff collection systems and expected contaminant</p>	<ol style="list-style-type: none"><li>1. Provide information on how contact and non-contact water from the site airstrip will be managed. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.</li><li>2. Provide further information on how potential contaminants in runoff from roads have been considered in the site water management. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.</li><li>3. Provide estimated volumes of water to be drained from overall site infrastructure (such as the mine terrace, airstrip, camp area etc.), during a 24-hr PMP event.</li><li>4. Provide additional information on culvert designs and conveyance capacity for PMP events.</li></ol>	<p>In a supplementary submission provided by Denison on July 9<sup>th</sup>, 2024, much of the information requested has been provided.</p> <p>Table 1 of round 3 attachment IR-12 is a screening of constituents of potential concern (COPCs) in water catchments. For the “Camp” catchment, risks to the aquatic environment from nutrients is described as “<i>None expected.</i>” However, sewage spills occur occasionally at camps and would release nutrients which could reach the aquatic environment.</p> <p>Also in Table 1, a management/mitigation often referred to is, “<i>A wash bay will be available to clean items, equipment, and vehicles that may have been in contact with potential contaminants.</i>” No further details were found on how wash bay water will be handled such that it does not pose a risk to the aquatic environment.</p> <p>The Proponent is relying on its spill response plan to handle any spills from the freeze plant and substation as well as the camp. Section 14 of the EIS, Accidents and Malfunctions, does not discuss these hazards. Given the stated reliance on the spill response plan for brine and sewage spills on site, it will be important that the plan explicitly address brine and sewage spills.</p> <p><u>In order to resolve this IR, Denison are expected to:</u></p> <ul style="list-style-type: none"><li>• Include nutrients from sewage as a contaminant of potential concern for the Camp Watershed in Table 1 of round 3 attachment IR-12 or provide justification why there are no risks to the aquatic environment from nutrients from the camp.</li><li>• Clarify how wash bay water will be handled, given that it may potentially contain contaminants.</li></ul> <p><i>The following outstanding issue will be further assessed as part of licensing technical reviews, prior to the granting of a Licence:</i></p> <ul style="list-style-type: none"><li>• Denison will be expected to incorporate information provided in this supplementary submission in the Spill Response Plan.</li></ul>	Not Accepted	<p><b>Note: For the complete history of the FIRT’s responses to this IR, refer to Appendix A below. Any attachments associated with the IR response in this table are available in Appendix A.</b></p> <p>In response to this IR, the Site Water Management Plan has been updated using track changes; see Attachment IR-12, IR-12-R1A, and IR-112-R1B (Round 3) below in Appendix A. Briefly for context, nutrients as a COPC related to sewage in the Camp Watershed have been incorporated into Table 1, and clarification with respect to the wash bay water management has been provided.</p> <p>In addition, responses to the CNSC’s round 4 comment related to nutrients, the wash bay, and commitments for the Spill Response Plan are also provided here.</p> <p><b><u>Nutrients:</u></b></p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					concentrations for the site airstrip and roads is needed to determine if the receiving environment and aquatic and terrestrial receptors are protected.		See also AD-75 in the Advice to Proponent table.		<p>The domestic wastewater treatment plant pond stores treated domestic wastewater prior to conveyance to the process water pond that reports to the industrial wastewater treatment plant (IWWTP). To clarify, the accidents and malfunctions assessment (EIS Section 14) considered four scenarios that could introduce COPCs to the environment from site “ponds and retention berms” (see Table 3-13, Appendix A or EIS Appendix 14-A), including overtopping, flooding and containment failure – the domestic wastewater treatment plant pond would fall into this generic “ponds and retention berms” category. The “ponds and retention berms” scenarios were deemed low risk or risks were deemed to be as low as reasonably practical (ALARP), given design and other mitigations.</p> <p><b><u>Wash Bay:</u></b></p> <p>Described in Section 2 of the EIS, a wash bay is proposed as part of the Wheeler River Project infrastructure. The wash bay will be available to clean items, equipment, and vehicles that may have been in contact with potential contaminants. The wash bay area will have an impermeable floor and a lined water collection sump. Rinse water from the wash bay sump will be routed to the wellfield runoff pond or directly to the</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									<p>process water pond. It will be subsequently conveyed as a component of the influent stream to the IWWTP where it will be treated. Treated effluent would be discharged to Whitefish Lake once deemed suitable for release.</p> <p>For the purpose of the site water management strategy, water derived from the wash bay is by definition “contact water”.</p> <p><b>New Commitment:</b> Denison concurs that it will incorporate information provided in this supplementary submission in the Spill Response Plan during licensing. This commitment is reflected in the updated commitment register (see commitment 2-35) that is provided as part of the EIS submission.</p>
IR-12	IR-12-R1A	ECCC	Change to an environmental component due to hazardous contaminants	Section 2.2.3, Project Description  Proponent response to IR-12	<p><b>Context:</b> Runoff water from site infrastructure such as the airstrip and roads may be categorized as non-contact water because it does not come into contact with contaminants of potential concern (COPCs) directly from mining operations infrastructure. However, it still has the potential to contain deleterious substances from mine-related activities such as operation of vehicles, including heavy machinery and aircraft, spills, fire management practices, and snow removal practices. The <i>Metal and Diamond Mining Effluent Regulations</i> (MDMER) pursuant to the <i>Fisheries Act</i> requires all mine effluent and seepage from the mine site that contains deleterious substances be discharged through a final discharge point. This includes deleterious substances in non-contact water from all site infrastructure including the airstrip, roads, and camp area.</p> <p><b>Rationale:</b> All mine effluent and seepage that contains deleterious substances must be discharged through a final discharge point. This includes site non-contact water which has the potential to contain deleterious substances such as those released from vehicles, machinery, aircrafts, spills, and de-icing practices. The Proponent has not included how non-contact water runoff from site infrastructure will be captured within site water management planning. To understand the potential effects of contaminants from non-contact water on the surrounding environment, site water management planning needs to be updated to include the capture of non-contact water.</p>	<ol style="list-style-type: none"><li>1. Update site water management plans to include management of potentially deleterious substances contained in non-contact water from all site infrastructure.</li><li>2. Provide updated estimates of water volumes to be drained and managed from overall site infrastructure (including runoff from roads, airstrip, camp area, etc.) during the different Project phases. Include updated information on water treatment flows, capacity and effluent discharge during normal operations, and a 24-hr Probable Maximum Precipitation (PMP) Event.</li></ol>	To be resolved as part of IR-12.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-12	IR-12-R1B	ECCC	Water Quality - Change to an environmental component due to hazardous contaminants	Section 2.2.3, Project Description  Proponent response to IR-12	<b>Context:</b> The Proponent has clarified that there is no infrastructure in place for management of non-contact water from site infrastructure that may contain COPCs, including but not limited to roads, the airstrip, and the campground.  <b>Rationale:</b> To understand the potential effects of contaminants from non-contact water on the surrounding environment, site water management planning needs to be updated to include the type of infrastructure and its location for the capture of non-contact water.	Provide a map marking the locations of proposed surface drainage structures for runoff collection including collection ditches, culverts, diversion ditches, perimeter berms, collection ponds and other similar structures.	See also AD-73 in the Advice to Proponent table.	Accepted	n/a
IR-13	-	ECCC  CNSC	Fish and fish habitat	Section 2.2.4, Waste Management  Section 2.2.7.7, Borrow Area  Section 2.3.1.3 Site Preparation and Earthworks	<b>Context:</b> The Proponent indicates that a borrow area is planned for an area northeast of the processing plant. The borrow material or overburden will be used during construction for roads, airstrip, pads, and in the batch plant for concrete production needs, during Operation for ongoing maintenance of various Project components and during decommissioning for fill and cover material. Suitable construction fill material will be sourced from the proposed borrow area and any suitable clean sandstone generated during freeze wall and well drilling (Section 2.2.7.7).  It was also noted in Sections 2.2.1.3 and 2.2.14 that the freeze wall will be established by drilling over 300 vertical holes from surface to the basement rock. The freeze holes will extend 30 m into the basement rock and will produce waste rock from basement rock (Figure 2.2-6). However, there is no information whether the waste rock from basement rock would potentially be acid generating and/or metal leaching. This means that all the extra 30 m of basement rock should also be characterized for potential ARD/ML to determine use or appropriate disposal.  <b>Rationale:</b> ECCC notes that the Proponent did not indicate whether the borrow material and the drill out part of the sandstone layers and basement rock will be tested for Acid rock drainage/metal leaching (ARD/ML) potential before they will be used during construction, operation and decommissioning. ARD/ML is an environmental hazard that will have an adverse effect on waterbodies frequented by fish.  Potential acid generating and metal leaching waste rock could pose negative impacts on the environment if they are not managed adequately.	Please provide: 1. Information on whether the waste rock from the basement rock is potentially acid generating and metal leaching; a. Confirm that any borrow material to be used for construction will be characterized for potential ARD/ML. b. Confirm that the part of waste rock recovered from the basement rock, will also be tested for potential ARD/ML.  2. Criteria for segregating the potential acid generating and metal leaching waste rock, if it exists, from clean waste rock; and,  3. A plan to manage the potential acid generating and metal leaching waste rock, if it exists.	Denison has captured their commitment to develop the waste rock segregation criteria and to develop appropriate mitigations and management for potentially acid generation (PAG) material in version 2 of the Commitments Register (ID 2-33), so this IR has been accepted.	Accepted	n/a
IR-14	-	CNSC	Wastes and Decommissioning	Section 2.3.3.1.3 Decontamination, Demolition, and Disposal (p. 2-82)  Table 4.3-2: Key Issues and Concerns from English River First Nation (p. 4-33)	<b>Context:</b> The EIS states “Concrete foundations will be left in place. Any portions of concrete foundations remaining above grade will be levelled and rebar will be cut-off at grade. Large slabs will be perforated on a 2-m grid to permit drainage. Concrete slabs will be covered with 0.5 m of development rock or locally stockpiled till.” (p. 2-82)  Further, Denison notes that “Concern about responsible authority for restoring the environment, including contaminants when mining concludes. How long will it take to have the environment fully restored and, if Denison is no longer the operator, how will this be completed?” (p. 4-33). This comment status is noted as <i>Complete</i> .	How has the proposal to leave these foundations in place been received by the Indigenous Nations and communities during engagement sessions? Have engagement activities influenced Denison’s planned decommissioning approach? Describe in additional detail how the comment from p. 4-33 has been addressed and how this has been received by those who expressed this concern?	Denison has captured their commitment related to addressing concerns from Indigenous Nations and communities on their decommissioning approach within the Preliminary Decommissioning Plans in version 2 of the Commitments Register (ID 4-5), so this IR has been accepted.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<b>Rationale:</b> Permanent structures will remain following decommissioning, according to the excerpt above. It’s unclear how engagement activities influenced Denison’s planned decommissioning approach, or how the comment above has been addressed or received.				
IR-15	-	ECCC	Fish and fish habitat	Section 2.2.3.4 Project Description Section 8.1.3.4.2, Aquatic Environment	<b>Context:</b> In Section 2.2.3.4 it is stated that the estimated PMP event for Project infrastructure planning is 483.3mm. In Section 8.1.3.4.2 it is stated that the PMP is 489.3 mm.  <b>Rationale:</b> It is unclear which value is the correct PMP value and if Project infrastructure has been planned correctly.	Provide the correct PMP value and verify that Project infrastructure has been designed utilizing the correct value.		Accepted	n/a
IR-16	-	CNSC	Human health with respect to hazardous contaminants	Section 2.2.3.8	<b>Context:</b> The EIS and technical supporting documents do not provide sufficient justification for the selection of the proposed wastewater treatment systems for the industrial wastewater treatment plant or the domestic wastewater treatment plant.  In addition, it is not clear how the upper bound of the industrial wastewater treatment plant effluent quality was obtained.  <b>Rationale:</b> Draft REGDOC-2.9.2 formally documents the CNSC’s expectations to Licensees for controlling releases to the environment. For proposed new facilities, these expectations include conducting a best available technology and techniques, economically achievable (BATEA) Assessment, and determining key parameters necessary to support the EIS. These include identifying: <ul style="list-style-type: none"><li>• environmental release targets to inform the design of wastewater treatment systems to constrain the quantity and concentration of contaminants and physical stressors released into the environment,</li><li>• the best available technology and techniques through an options analysis; and</li><li>• the anticipated influent characteristics, overall treatment efficiencies, and maximum predicted design release as the output of the assessment.</li></ul> Consideration of the principle of pollution prevention and BATEA is also a requirement of REGDOC-2.9.1.  CNSC staff have met with Denison to discuss the expectations in draft REGDOC-2.9.2.	Please provide a summary of the BATEA assessment to justify the selection of the wastewater treatment plant system.  As part of the summary, please identify the anticipated environmental release targets used to inform the design, as well as the maximum predicted design release concentrations and loadings to the receiving environment. The maximum predicted design releases should be used in the ERA to demonstrate protection of people and the environment.		Accepted	n/a
IR-17	-	CNSC	Human health with respect to hazardous contaminants	Section 2.2.3.8	<b>Context:</b> It is also acknowledged that Denison stated in meetings with CNSC staff that Denison intends to propose final release targets to the CNSC as part of the licence application submission.  <b>Rationale:</b> It is not clear in the submission whether Denison has considered whether any applicable technology-based performance standards exist in Canada or internationally, and would be relevant as effluent discharge targets, in order to ensure principles of pollution prevention are applied. Consideration of this would	Denison should harmonize their proposed Effluent Release Targets with the technology-based performance standards that exist in the Metal and Diamond Mining Effluent Regulations where applicable, or other suitable international regulations.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>help ensure that the proposed effluent discharge targets harmonize with existing federal, provincial/territorial, and/or municipal requirements. For example, there are release limits for radium-226, TSS, and pH outlined in the federal Metal and Diamond Mining Effluent Regulations, which have been demonstrated to be achievable in the uranium mine and mill industry.</p> <p>In addition, countries like the United States, where in-situ recovery has been conducted in the past, have specific technology-based limits. These are known as New Source Performance Standards and are identified in US Code of Federal Regulations (US CFR) 40, Chapter 1, Subchapter N, Part 440 – Ore Mining and Dressing Point Source Category. It is not clear whether these have been considered in Denison’s assessment. These should be considered when identifying suitable achievable technologies.</p>				
IR-18	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 2.2.3.9, Project Description  Appendix 8-E	<p><b>Context:</b> In Table 2.2-1 the upper bound Industrial Wastewater Treatment Plant (IWWTP) effluent quality final discharge targets for Constituents of Potential Concern (COPCs) are provided. General parameters (e.g., temperature, pH, etc.), and several Schedule 4 Substances with maximum authorized concentrations (lead, nickel, suspended solids, and un-ionized ammonia) under the Metal and Diamond Mining Effluent Regulations (MDMER) have not been provided in this table. There are several COPCs (aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese) for effluent characterization under Schedule 5 Section 4 of the MDMER that have not been provided in this table. Additionally, no information on water quality guidelines has been provided in this table.</p> <p>Furthermore, it is stated that the final effluent quality discharge target for uranium is 0.057 mg/L. However, the Canadian Council of Ministers of the Environment (CCME) water short term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guidelines, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe.</p> <p><b>Rationale:</b> ECCC requests the Proponent include the general water quality parameters that influence water quality thresholds, parameters in Schedule 4 and Schedule 5 Section 4 of the MDMER, and their respective water quality guidelines for consideration and transparency.</p> <p>Discharges from the proposed Project will alter water quality in the immediate receiving area, and this may include some sublethal effects on aquatic biota, which must be minimized. It remains the Proponent’s responsibility to adhere to the MDMER to ensure that effluent at the end-of-pipe from all final discharge points be non- acutely lethal and meet requirements for prescribed deleterious substances under Schedule 4 of the regulations.</p>	<ol style="list-style-type: none"><li>1. Update Table 2.2-1 and Appendix 8-E to include all general parameters required for environmental effects monitoring: pH, temperature, hardness, alkalinity, and conductivity.</li><li>2. Update Table 2.2-1 and Appendix 8-E to include missing Schedule 4 Substances under the MDMER with maximum authorized concentrations: lead, nickel, suspended solids, and un-ionized ammonia.</li><li>3. Update Table 2.2-1 and Appendix 8-E to include missing Schedule 5 Section 4 parameters required for effluent characterization under the MDMER: aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese.</li><li>4. Include all acute and chronic water quality thresholds for each parameter in Table 2.2-1 and Appendix 8-E.</li><li>5. Describe additional mitigation measures that can be considered to minimize impacts to aquatic biota from uranium concentrations in effluent.</li></ol>	<p>In a supplementary submission provided on July 5<sup>th</sup>, 2024, Denison provided responses to the following outstanding requests:</p> <ol style="list-style-type: none"><li>1. Update Table 2.2-1 and Appendix 8-E to include all general parameters required for environmental effects monitoring: pH, temperature, hardness, alkalinity, and conductivity.</li><li>2. Update Table 2.2-1 and Appendix 8-E to include the following missing Schedule 5 Section 4 parameters required for effluent characterization: aluminum, iron, nitrate, thallium, and manganese. Provide further explanation if this information is not available.</li><li>3. Include all acute and chronic water quality thresholds for each parameter in Table 2.2-1 and Appendix 8-E. Include information on the concentrations of modifying environmental factors (i.e. pH, hardness, etc.) used to calculate these guidelines as footnotes.</li><li>4. Provide a clear commitment to ECCC for continued consultation on developing effluent discharge targets including a review of final_predicted effluent discharge targets once available.</li></ol> <p><i>This IR is resolved for the purposes of the EA process. The outstanding issues below will be further assessed as part of licensing technical reviews, prior to the granting of a licence.</i></p> <p>For item one, the effluent conductivity and TDS presented are not plausible, as explained in the FIRT’s May 31<sup>st</sup> draft comments. As the conclusions of significance for the EA are not influenced by this error, the correct effluent conductivity and TDS will be assessed during the BATEA assessment required for licencing, and predictions will be updated by Denison as needed. It is recommended that conductivity not be used as a surrogate for TDS while monitoring, until the conductivity-TDS relationship is corrected.</p> <p>Follow up for item three is addressed in IR-108 and IR-115.</p>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
							To address item four, the Proponent will have to follow the guidance and requirements in REGDOC-2.9.2 to develop effluent discharge targets. The CNSC will engage with ECCC during this process as necessary.		
IR-19	-	ECCC	Change to an environmental component due to radiological contaminants	Section 2.2.4 Project Description	<p><b>Context:</b> In this section, it is proposed that the IWWTP precipitate pond will have a single geosynthetic composite liner system, which is used for ponds/pads that only store non-radioactive materials.</p> <p>However, from Section 2.2.3.9 on industrial wastewater treatment, it is unclear if the precipitates from the stage three neutralization process that are pumped to the IWWTP precipitates pond will have any residual radioactivity.</p> <p><b>Rationale:</b> For the protection of the surrounding environment, it is important that any ponds/pads that are expected to store radiological contaminants be designed to have proper controls (i.e., liners with monitoring systems) in place.</p>	<p>1. Confirm the characterization of the precipitates that are to be stored in the IWWTP precipitate pond.</p> <p>2. If radiological constituents are expected within those precipitates, update the draft EIS to ensure the proposed geosynthetic liner system for the IWWTP precipitate pond will be adequate to ensure the protection of the surrounding environment.</p>		Accepted	n/a
IR-20	-	NRCan	Fish and fish habitat	Section 2.3.3.1.1 Appendix 7-C	<p><b>Context:</b> The Proponent's objective for mining area remediation is to restore the groundwater within the confines of the freeze wall to an acceptable remediation target (EIS, sec. 2.3.3.1.1). The Proponent's acceptable decommissioning objectives for groundwater quality are provided in EIS Table 2.3-3 and in Table 3-5 of Appendix 7-C. These objectives were based on laboratory core flood tests performed by flushing samples of ore with groundwater and groundwater amended with sodium hydroxide or sodium bicarbonate. The composition of the remediated groundwater observed in the core flood tests serves as the source term for the post-decommissioning reactive transport modeling presented in section 4 of Appendix 7-C.</p> <p><b>Rationale:</b> In NRCan's opinion, it is important for reviewers to be able to assess the level of remediation achieved in order to reach the Proponent's decommissioning groundwater quality objectives. Therefore, the Proponent should provide complete water quality data for the pregnant lixiviant that remains in the ore zone after the end of mining and prior to any remediation.</p>	NRCan requests that the Proponent revise Table 3-5 of Appendix 7-C to show the water quality in lixiviant remaining in the ore zone at the end of mining, prior to remediation activities.		Accepted	n/a
IR-21	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 2.3.3.1.3, Project Description	<p><b>Context:</b> The decommissioning process for the wellfield and associated infrastructure is discussed, however there is no information provided on the potential risk for subsidence of the ground above the depleted uranium deposit. After the uranium has been dissolved and pumped to the surface, a cavity will be formed in the area where the uranium used to exist. This could destabilize the overlying substrates, causing the ground at the surface to sink in the future. There is currently no information regarding this risk, and how it may alter the overlying environment, surface water features, runoff, or existing nearby waterbodies.</p> <p><b>Rationale:</b> From a surface water and sediment quality perspective, it is important to understand how potential subsidence in the future post-decommissioning may affect the existing environment. It is currently unclear if there is any risk to the aquatic environment if subsidence were to occur and alter existing waterbodies, create new surface water features, or if there will be any risk to the</p>	Provide further information on the potential risks from subsidence including the probability of occurrence, how it may affect surface water features, and if there exists any risk to the planned decommissioning of waste management infrastructure.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					decommissioned onsite industrial landfill and industrial wastewater treatment plant precipitate pond.				
IR-22	-	NRCan	Fish and fish habitat	Section 2.10  Appendix 2-C, section 1.1.1.4	<p><b>Context:</b> With respect to the choice of In-Situ Recovery (ISR) mining solution, two alternatives were assessed: alkaline and acidic lixivants (Appendix 2-C, sec. 1.1.1.4). In the consideration of technical and economic feasibility of the alternatives (Table 2, Appendix 2-C), the Proponent concludes that: Option 1 (alkaline) is not technically feasible based on the uranium deposit geochemistry. Option 2 (acidic) is technically and economically feasible based on the uranium deposit geochemistry and ability to dissolve uranium. Accordingly, the alkaline alternative was not carried forward into the Environmental Assessment (EIS, Table 2.10-1; Appendix 2-C, Table 3).</p> <p>While acidic ISR solutions are widely used internationally (e.g., Kazakhstan), in the United States, where the environmental regulatory regime is more strict, alkaline solutions have been used exclusively since 1970.</p> <p><b>Rationale:</b> In NRCan's opinion, the Proponent should provide a more thorough technical justification for adopting an acidic ISR lixiviant.</p>	In the Alternative Means Assessment (Appendix 2-C), NRCan requests that the Proponent provides a more thorough technical justification for selecting an acidic ISR lixiviant rather than a less environmentally problematic alkaline leach used exclusively in the USA.		Accepted	n/a
IR-23	-	CNSC	Alternative Means	Section 2.10.2 Alternative Means  Appendix 2-A PD Engagement Tables  Appendix 2-C Alternative Means Assessment (p. 3)	<p><b>Context:</b> There are multiple rows in the Indigenous Tables for Appendix 2-A where comments and concerns raised by Indigenous Nations and communities and other members of the public were taken into consideration in the Alternative Means Assessment. However, it is unclear how these were considered.</p> <p>A few examples:</p> <ul style="list-style-type: none"><li>16-EN-DesNd-101.1: Interested in any future business opportunities that may be available as Denison advances their Wheeler River Project.</li><li>16-EN-ERFN-100.15: In that territory near the Wheeler River there are a lot of spawning and calving areas for moose, caribou; those creeks are for whitefish spawning. There's lots of heavy muskeg there. A lot of us have been there, and we'd like to know there'll still be access to the area.</li><li>6-EN-ERFN-100.17: Today because of climate change, things are starting to happen that normally didn't happen. Even the permafrost is now further down. In the Wheeler River area, where there's some permafrost, have your environment guys seen a change? Will there be a change? These are some of the questions that need to be answered in order to come out with a positive spin.</li></ul> <p><b>Rationale:</b> Appendix 2-C, Alternative Means assessment, states (p.3): "Engagement with Interested Parties naturally included alternatives means and the engagement input was included in the evaluation of alternative means. Refer to the references list below and <i>Appendix 2-A Engagement Database Summary – Project Description</i> for details of engagement information referenced in this alternative means assessment."</p>	Please explain how comments and concerns collected during Denison's engagement sessions were considered or influenced the alternative means assessment. Please include this information in the EIS and/or it's appendices.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					It is unclear in section 2.10.2 of the EIS, Appendix 2-A or Appendix 2C how the comments documented by Denison have been considered or influenced the alternative means assessment.				
IR-24	-	CNSC	Alternative Means	Section 2.10.2 Alternative Means	<p><b>Context:</b> While Appendix 2-C (Alternative Means Assessment) is detailed and includes all aspects of the Alternative means assessment that are required, the summary of the analysis and conclusions in Section 2.10.2 of the EIS lacks the level of detail required to understand the methodology used, and how Denison arrived at these conclusions.</p> <p><b>Rationale:</b> As noted in the Agency’s <a href="#">Operational Policy Statement on Addressing “Purpose of” and “Alternative Means” under the CEAA 2012</a>: “If a preferred means is selected, the analysis and the rationale for the choice should be explained from the perspective of the Proponent, and be documented in the EIS in sufficient detail to provide context for public and technical comment periods during the project EA, and ultimately to allow the decision maker to understand the choice.”</p>	<p>Please summarize the analysis of the alternative means assessment within the body of the EIS, in sufficient detail that a reader of the EIS has adequate information to understand the methodology used, and how Denison arrived at these conclusions.</p> <p>*Note: In addition to the adding text to summarize, Table 6 in Appendix 2-C could be useful to understanding table 2.10.1 in the EIS.</p>		Accepted	n/a
IR-25	-	CNSC	Current use of lands and resources for traditional purposes	Section 3, Sections 4, Section 5, Section 11 (and all other applicable once Métis Knowledge Use Study is completed)	<p><b>Context:</b> The EIS states that Denison is currently negotiating an agreement with MN-S and no traditional land use information is included throughout the EIS given no agreement was signed or Traditional land use information was shared at the time the EIS was being drafted.</p> <p>As noted in the EIS Denison has committed that: “As information becomes available from the agreed-upon process between the Métis Nation – Saskatchewan and Denison, it will be incorporated into the final EIS.” (p. 11-36)</p> <p><b>Rationale:</b> More information is required to better understand the issues and concerns, valued components, and current use of lands and resources for traditional purposes by MN-S near the Project area.</p> <p>Requirements are detailed in CNSC’s Generic EIS Guidelines, section 8.9: Indigenous land and resource use.</p>	<p>Please update the revised Draft EIS to reflect the integration of the Métis Use and Knowledge Study in the Draft EIS where applicable, when this study is completed and provided to Denison.</p> <p>In addition, please include an updated Issues and Concerns table that includes relevant information from the MN-S as a result of engagement activities and relevant MN-S studies in the next version of the EIS, as appropriate.</p> <p>Should this information not be made available to Denison at the time of revising the draft EIS, the next version of the EIS and the response to this IR should provide a status update on discussions and engagement with MN-S and next steps.</p>		Accepted	n/a
IR-26	-	CNSC	Precautionary principle and approach	Section 3.4.8 Lands Taken Up from an Indigenous Perspective (p. 3-14)	<p><b>Context:</b> Denison states: “Discrepancies among IK and western scientific information provide an opportunity for Denison to take a precautionary approach. Examples of concrete actions to address uncertainty in cases where IK and LK have differing conclusions on predicted Project effects include addressing uncertainty through monitoring and follow-up programs and communicating results of those monitoring and follow-up programs to demonstrate they have been responsive to the IK shared.” (p. 3-14)</p> <p><b>Rationale:</b> CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> state: “In documenting the analyses included in the EIS, the Proponent will demonstrate that all aspects of the Project have been examined and planned in a careful and precautionary manner in order to avoid significant adverse environmental effects.</p>	<p>Please clarify how the precautionary principle, and the Privy Council Office’s, <a href="#">A Framework for the Application of Precaution in Science-based Decision Making About Risk, sets out guiding principles for the application of precaution to science-based decision making</a> has been considered and incorporated into the EA described in the EIS.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					A document by Canada’s Privy Council Office, <a href="#">A Framework for the Application of Precaution in Science-based Decision Making About Risk, sets out guiding principles for the application of precaution to science-based decision making.</a> ” (Section 2.5)				
IR-27	-	CNSC	Cumulative Effects Analysis	Section 3.4.8	<p><b>Context:</b> During an outreach and engagement trip by CNSC in October 2022, an abandoned exploration camp adjacent to the proposed Wheeler River site was observed. This site has not been identified within the EIS as part of the cumulative effects assessment. As noted in section 3.4.8, KML has also raised concerns with Denison related to abandoned camps and industrial waste left with no programs for clean-up.</p> <p><b>Rationale:</b> Section 9.4.3 of CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> states that “The applicant shall assess any residual adverse environmental effects of the Project in combination with other past, present or reasonably foreseeable projects and/or activities within the study area.”</p>	Please specify why abandoned exploration camps and industrial waste aren’t taken into consideration when completing cumulative effects assessment.		Accepted	n/a
IR-28	-	CNSC	Current use of lands and resources for traditional purposes	Section 4, IER and engagement appendices, including: Appendix 2-A Appendix 6-B Appendix 7-B Appendix 8-A Appendix 9-A Appendix 10-B Appendix 11-A Appendix 12-A Appendix 13-A Appendix 14-B	<p><b>Context:</b> The summary of issues tables do not appear to include all of the key issues identified by the Indigenous Nations and communities.</p> <p>For example, some Indigenous Nations and communities have shared concerns with respect to accident prevention and overall safety on the Key Lake road (Highway 914) due to increased traffic, impacts on treaty rights and section 35 rights due to cumulative impacts, and decommissioning, that were not captured in the issues and concerns and summary tables in Section 4.3.2 and in the IER.</p> <p>The tables in the engagement appendices include a column titled “Response (From Denison)”. The “Response” column does not include responses, but instead points the reader to where this comment or concern was considered. When navigating to the sections referenced, it is often unclear how this information was considered or influenced the assessment.</p> <p><b>Rationale:</b> Additional detail is required in order to ensure the key issues are all identified and to understand the status of validation for each issue raised and the response provided.</p>	<p>1. Update the summary of issues and concerns tables to include all relevant issues and concerns raised by each of the Indigenous Nations and communities to date, including concerns raised in the Indigenous Knowledge studies provided, additional engagement, and Draft EIS comments.</p> <p>2. Please include a column in the issues and concerns tables to clearly articulate the specific mitigation/monitoring measures that Denison have committed to, or any other measures, in order to address the concerns raised by each Indigenous Nation and community during the engagement process to date.</p> <p>3. Denison must demonstrate that each Indigenous Nation and community has validated that the summary of issues and concerns table reflects their understanding or agreement, and/or a path forward to complete the validation throughout the EIS and the updated IER.</p> <p>Validation must be complete by the time the technical review is complete, prior to submission of a final EIS. Should Denison not be able to fully address issues, concerns or feedback raised by any Indigenous Nation or community, through mitigation and monitoring measures, this should be documented, and a rationale provided.</p> <p>4. Update the response column of the Engagement tables to describe how these were considered in the sections referenced. Consider renaming this column to reflect the nature of the content (i.e., how the information was considered).</p>	<p>This response has been accepted. Denison has provided fully updated information as of January 2024.</p> <p>It will be expected that a fully updated IER and issues and concerns tables for each Nation as per the original IR, be provided in future submissions, for CNSC staff awareness of progress on this work. This includes updates on the validation from all Nations and communities, or updated paths forward to validation, if applicable.</p> <p>Note: In the IER Denison provides this information in charts categorized by Nation and in the Appendix 4-B of the EIS, Denison instead includes one large chart with the concerns categorized by key topic. CNSC would recommend using only one method for both the IER and EIS, preferring the format used in the IER by Indigenous Nation and/or community.</p>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-29	-	CNSC	Current use of lands and resources for traditional purposes	Section 4.3.2 and IER	<p><b>Context:</b> In this section, Denison includes the engagement with BNDN and includes a summary of issues and concerns table for the Nation. Within the history of interactions (Section 4.3.3.2.1).</p> <p><b>Rationale:</b> Denison states that they have been providing information on the Project to BNDN in 2019, 2021 and again in 2022 and that Denison and BNDN have not responded to date in order to advance further engagement and dialogue.</p>	Please ensure updated information of any additional engagement activities that Denison has completed with BNDN related to understanding their current and traditional land use and potential interests near the proposed project is provided.		Accepted	n/a
IR-30	-	CNSC	Indigenous physical and cultural heritage	Section 4.3.2.1.3, Table 4.3.2	<p><b>Context:</b> Concerns were raised during engagement sessions that “Elders are not being consulted as most of the engagement has been through online means and without a translator”.</p> <p><b>Rationale:</b> There’s no indication that a translator has been employed to engage with Elders since 2021 in the engagement Table 4.3.2.</p>	How has Denison adapted engagement with Elders from the ERFN since receiving this comment on March 31, 2021?		Accepted	n/a
IR-31	-	CNSC	Indigenous Engagement	Section 4.4.2.1.3, Key Engagement Activities (p. 4-88)	<p><b>Context and Rationale:</b> Regarding the following: “An open house for the general public was planned to be hosted in 2022 on preliminary effects and mitigation, but due to concerns identified by MN-S about hosting a public open house in a community with a significant Métis population, this meeting was postponed by Denison. Denison looks forward to rescheduling the meeting in collaboration with the MN-S.” (p. 4-88)</p>	Please provide an update on the evolution or progress of this engagement with local communities, following collaboration with MN-S (or otherwise).		Accepted	n/a
IR-32	-	CNSC	Current use of lands and resources for traditional purposes	Section 5.3  Section 9.0 Terrestrial Environment	<p><b>Context:</b> Some sections of the EIS (such as Fish and Fish Habitat, Indigenous Lands and resource use) indicate that Indigenous and/or local knowledge was considered when defining the spatial boundaries. However, this is not included in other sections, such as Terrestrial Environment.</p> <p><b>Rationale:</b> Section 5.2.2 of CNSC’s Generic EIS Guidelines require that spatial boundaries be defined by considering, but not limited to, the following criteria: Community and Indigenous traditional knowledge, ecological and technical considerations.</p>	<p>Please provide any additional details about how any comments or concerns raised were considered in defining the spatial boundaries with Indigenous Nations and communities with respect to spatial boundaries, for the Terrestrial Section and which specific Indigenous Nations and communities were engaged on these topics and how their input and knowledge was incorporated into the EIS.</p> <p>If already presented in the EIS text body, please indicate where this information can be found or link to Section 4 of the EIS or in the IER.</p>		Accepted	n/a
IR-33	-	CNSC	Residual Effect Characterization	Section 5.8.1, Definitions for Residual Effects Characterization and Significance  Section 5.8.1.1, Residual Effects Characteristics  Section 8, Table 8.3-9: Fish and Fish Habitat -	<p><b>Context:</b> Denison uses specific criteria (Residual Effect Characteristics: Direction, magnitude, geographic extent, duration, frequency, reversibility, context and likelihood) and associated ratings (e.g., adverse/positive, low/moderate/high) for the predicted effects assessment. However, it is unclear whether an aggregation method was used in order to determine whether impacts will be significant or not significant, depending on the combination of rating categories (i.e., weightings that were calculated, use of decision rules).</p> <p>For example, medium term and long term are both used to represent the same time category: “Effects are expected to last between 3 to 38 years (i.e., effects expected during Construction through to the end of post-Decommissioning).” (See table 8.4-13 on p. 8-200 compared to table 8.4-12 on p. 8-199 and table 8.5-9 on p. 8-246).</p>	<p>If an aggregation method was used and ratings (e.g., High, medium, low) were weighted, what weightings were used, how were these calculated? Please also describe any decision rules that informed the determination of significance.</p> <p>If no aggregation was used, how did Denison ensure that results were consistent, given the varying rankings for each of the key criteria, and varying combination?</p> <p>Regarding inconsistencies in ratings, please use consistent terminology for same rating.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
				Surface Water Quality	<p><b>Rationale:</b> The Generic Guidelines state: “The method used to describe the level of the adverse effect should be transparent and reproducible.”</p> <p>In Table 8.3-11, duration was moderate, but again uses same rationale. There is no 'moderate' in Table 8.3-8, and by the same rationale, this should be medium-term to be consistent with definitions provided and summary Table 8.3-12.</p> <p>It was noted that all three tables should be deemed medium-term based on definitions of ratings outlined in Table 8.3-8. Frequency was also showing up as "continuous" and "continuously" in these tables.</p>				
IR-34	-	CNSC	Cumulative Effects Analysis	Section 5.9.2.2 (p. 5-41)	<p><b>Context:</b> Denison identifies the Gryphon deposit as a project that is not reasonably foreseeable. The direct quote from the EIS indicates that the “Development of the Gryphon deposit as an underground mine was evaluated at the prefeasibility level in 2018 but has not advanced to feasibility study or EA. Denison has not announced an intent to proceed with the development of the Gryphon deposit.” (p. 5-41)</p> <p><b>Rationale:</b> The guidance <a href="#">Assessing Cumulative Environmental Effects under the CEAA, 2012</a> defines <i>Reasonably Foreseeable</i> as a “physical activity [that] is expected to proceed, e.g. the Proponent has publicly disclosed its intention to seek the necessary EA or other authorizations to proceed.”</p> <p>In a press release by Denison Mines (2018: <a href="#">Denison announces decision to advance Wheeler River Project following positive PFS results</a>), Denison publicly disclosed intention to seek the necessary EA for Gryphon to proceed: “After careful consideration of the risks and opportunities associated with permitting and concurrent advancement of project engineering activities, the Company has decided to submit a PD and initiate the EA process in early 2019 for the Phoenix ISR operation, and to bring the Gryphon operation forward, at a later date, as required to achieve the PFS plan of Gryphon first production by 2030.”</p> <p>Further, Denison’s <a href="#">Wheeler River Webpage</a> references a “start of pre-production activities for the Gryphon operation in 2026”</p>	Please update the cumulative effects assessment in the EIS to include the Gryphon deposit as a Present or Reasonably Foreseeable Project.		Accepted	n/a
IR-35	-	CNSC	Change to an environmental component due to hazardous contaminants	Section 6, Chemicals of Potential Concern	<p><b>Context:</b> The use of petroleum products (e.g., propane, gasoline, and diesel) at the Denison Mines Wheeler River site is associated with vehicles and periodic operational testing of emergency generators as well as stationary pumps for emergency power or fire water systems. Thus, the air emissions will contain acrolein.</p> <p><b>Rationale:</b> This chemical of potential concern (COPC) poses potential risks to human health via inhalation, but acrolein appears to have been missed or deemed insignificant. However, its consideration in the assessment will provide information on the significance of the associated risk.</p>	Please consider acrolein in the assessment or provide a rationale for its exclusion.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-35	IR-35-R1	Health Canada (HC)	Change to an environmental component due to hazardous contaminants  IR-35 Response from Denison	Section 6, Chemicals of Potential Concern	<b>Context:</b> Potential health risks from long-term exposure to acrolein were not considered in the Proponent’s response to IR-35.  <b>Rationale:</b> No annual predicted concentrations for acrolein were provided in the draft EIS or in the response to IR-35. Concentrations were modelled for short-term exposure (1h and 24h) only in the draft EIS and compared to the 1-hour and 24-hour Ontario Ambient Air Quality Criteria for acrolein. It is Health Canada (HC) guidance to assess both potential short and long-term health effects. The predicted annual concentrations for acrolein should be compared against chronic reference concentrations (e.g., the USEPA Reference Concentration (RfC) <sup>1</sup> (0.02 µg/m <sup>3</sup> ) and the Tolerable Concentration (TC) from Environment and Climate Change Canada and Health Canada’s Priority Substances List Assessment Report <sup>2</sup> (0.4 µg/m <sup>3</sup> )).	Use predicted annual concentrations and available chronic reference concentrations to account for potential health risks from long-term exposure to acrolein to support the decision to screen out acrolein as a COPC from further assessment.	This IR has been accepted. In a June 27 <sup>th</sup> , 2024 supplementary submission, updates were made to Table 3-10 in the Revised DRAFT EIS (January 2024; Appendix 10-A - Environmental Risk Assessment) to include the predicted maximum annual concentration for acrolein at the fence line, as noted in Denison’s Response to IR-35.	Accepted	n/a
IR-36	-	CNSC	Other	Section 6, Table 6.1-11 Baseline External Gamma Monitoring	<b>Context:</b> For one of the exposures in the summary table for baseline external gamma monitoring (Table 6.1-11), the cell states "Destroyed in Field".  <b>Rationale:</b> No rationale or indication as to why or how it was destroyed is provided.	Please provide any additional info available as to how equipment was destroyed.		Accepted	n/a
IR-37	-	CNSC	Air Quality	Section 6.1.1.1, CALPUFF model	<b>Context:</b> "The Saskatchewan Ministry of Environment (SK MOE) has developed the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) to assist Proponents in conducting air dispersion modelling assessments in a consistent manner. The guideline defines the recommended approach for dispersion modelling assessments in Saskatchewan, including model selection, emission source characterization, and the determination of compliance criteria to apply."  <b>Rationale:</b> Saskatchewan air quality guideline requires consultation on use of CALPUFF model, where it states" The ministry acknowledges that there will be situations where specialized air dispersion models such as CALPUFF, CALQ3HCR and others may be applicable. The use of specialized models requires consultation with the ministry” OR “Pre-consultation with the ministry must be undertaken prior to the facility conducting specialized modelling (p. 3)." It is not clear if Denison Mines consulted with Saskatchewan MOE on use of CALPUFF model.  Noted that Section 6.1.4.2 is again referring to Saskatchewan MOE guidance for justification, but no indication that they consulted with them (a requirement).	Please confirm and provide a summary of the consultation with the Saskatchewan MOE on the use of CALPUFF model for the Wheeler River EIS as per provincial air quality guidelines.		Accepted	n/a
IR-38	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 6.1.4.1, Potential Interactions Between the Project and Valued	<b>Context:</b> In this section, the Proponent identifies primary interactions between Project activities and air quality valued components and their associated key indicators. These primary interactions may result in an adverse effect on the valued component. Among the primary interactions are the use of emergency generators in a backup role should there be an interruption of the provincial electrical grid.	Provide an evaluation of a worst-case scenario of grid power interruptions (i.e., average aggregate length of power outages) during the winter months for this section of the electrical power grid.		Accepted	n/a

<sup>1</sup> [https://iris.epa.gov/static/pdfs/0364\\_summary.pdf](https://iris.epa.gov/static/pdfs/0364_summary.pdf)

<sup>2</sup> [https://www.canada.ca/content/dam/hc-sc/migration/hc-sc/ewh-semt/alt\\_formats/hecs-sesc/pdf/pubs/contaminants/psl2-lsp2/acrolein/acrolein-eng.pdf](https://www.canada.ca/content/dam/hc-sc/migration/hc-sc/ewh-semt/alt_formats/hecs-sesc/pdf/pubs/contaminants/psl2-lsp2/acrolein/acrolein-eng.pdf)

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
				Component / Key Indicators	However, it is not evident what is the anticipated frequency and duration of interruption to grid power.  <b>Rationale:</b> The Proponent states in the conservative operation scenario that while the site will be powered from the provincial grid at the operations stage, the back-up power generators were assumed to be operating under emergency conditions as a worst-case scenario. ECCC acknowledges the positive impact of extending the electrical grid to the Project site with resultant reduction in generator emissions. The impact of an interruption in grid power would be greatest during the winter months when energy use would be greatest and surface-based temperature inversions, which vertically trap emissions, would be strongest.				
IR-39	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 6.1.4.2, Potential Project-Related Effects	<b>Context:</b> In this section, the Proponent discusses the approach taken for air dispersion numerical modelling. Using their CALMET data set, the Proponent’s CALPUFF model runs indicated exceedances for 24- hour total suspended particulates, 24-hour particulate matter (PM10), 1-hour nitrogen dioxide, and 24-hour uranium concentrations. However, there is no mention of possible diurnal and seasonal occurrences of the exceedances.  <b>Rationale:</b> Adequate assessment of the modelling results requires knowledge of the temporal characteristics for the exceedances. For example, wintertime exceedances may be due to strong temperature inversions, especially during the overnight to morning hours. These strong inversions are challenging for numerical models to capture. Exceedances during warmer months may be due to specific wind directions, which transport emissions directly to downwind receptors.	Provide additional information on any diurnal and seasonal influences of the modelled exceedances.		Accepted	n/a
IR-40	-	CNSC	Air Quality	Section 6.1.6.2.1, Air quality significance determination	<b>Context:</b> Significance determination was not conducted for air quality due to interconnectedness with other assessment endpoints.  <b>Rationale:</b> It is not clear where and how these air quality assessment endpoints were factored into the assessment.	Please provide additional information to demonstrate where and how these air quality assessment endpoints were factored in.		Accepted	n/a
IR-41	-	CNSC	Air Quality	Section 6.1.6.2.2, Background concentrations	<b>Context:</b> The EIS states that "Conservative regional background concentrations from the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) and based on the La Loche monitoring station were used for particulate matter, NO2, SO2, and CO. The La Loche monitoring station is located near anthropogenic sources, while the Project is in a remote area removed from anthropogenic sources."  <b>Rationale:</b> If La Loche monitoring station is located near anthropogenic sources and the Project is not, use of this data is not a conservative or realistic representation of background.  For a realistic approach, background data considered should be upper 95th percentile (or max if n<10) from an area representative of project location  For a conservative approach, background data from an area located even further	Please provide additional rationale to justify the appropriateness of La Loche monitoring station concentrations as background for project location.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>from anthropogenic sources (if this exists) should be used, or an upper limit of background less than upper 95th should be applied as the background.</p> <p>Upper limit of background is used to screen out COPCs or often subtracted from total to ascertain relative contribution / impact from source, so using a higher upper limit may result in COPCs screening out or appear to have a lower relative contribution. If background was added to source, then approach used would be conservative. If this is the case, confirmation and reference to where this is discussed in methodology should be provided.</p>				
IR-42	-	HC	Physical stressors (noise and vibration)	Section 6.2.4.2.2, (p. 6-66)  Section 6, Section 6.2.9, (p. 6-72)	<p>Nighttime noise impacts are not adequately considered for human receptors.</p> <p><b>Context:</b> The EIS states in Section 6.2.9 that, “While the predicted sound levels were less than the guideline values, the increase from baseline was predicted to be noticeable” (p. 6-72). No information is provided on individual noise events occurring during the nighttime period.</p> <p><b>Rationale:</b> While the increase from baseline is predicted to be noticeable, it is important to also consider that changes to the characteristics of the sound from baseline (e.g., a change in frequency, changes in sound modulation, increased impulsiveness or tonality, or a shift in noise from the daytime to being more at night) may cause noise to be even more noticeable. Consult <a href="#">ANSI S12.9-2005/Part 4</a>, clause A.1.3 for further information.</p> <p>In particular, consideration should be given to potential impacts on sleep, where adverse impacts are reported to begin when sound levels inside bedrooms exceed 30 dBA for continuous noise sources and 45 dBA LAmax for discrete noise events (<a href="#">WHO, 1999</a>).</p>	<p>1. Provide a description of the project- related nighttime noise sources that may impact human receptors as well as a qualitative discussion of the resulting potential impacts on perception considering not only changes in sound levels but also sound characteristics (e.g., tonality, impulsivity).</p> <p>2. Confirm whether individual nighttime noise events exceeding 45 dBA LAmax outdoors (or 30 dBA indoors) are expected to occur more than 15 times over the nighttime period at any nearby potentially noise-sensitive human receptor location(s). This may be of particular concern if some construction and/or operations activities occur during sleeping hours.</p>		Accepted	n/a
IR-43	-	HC	Physical stressors (noise and vibration)	Section 6.2.5, (p. 6-66)  Section 6.2.5, (p. 6-71)	<p>Mitigation measures for project-related noise were not identified for the Construction phase.</p> <p><b>Context:</b> The mitigation measures provided in Section 6.2.5, including a complaint management system is also to be implemented as part of the EMS, are only proposed for the operations phase.</p> <p>However, construction activities are predicted to last more than one year. Construction noise will involve the use of equipment operating at the site, construction of surface facilities, drilling, and partial operation of the freeze plant. It will also include regular truck trips and air traffic for personnel changes.</p> <p><b>Rationale:</b> It is unclear if listed mitigation measures also apply to the construction phase (or only to the operations phase).</p>	<p>1. Clarify whether mitigation measures and the proposed EMS apply to the Construction phase. If not, identify mitigation measures for noise impacts related to Construction phase activities, and consider applying the EMS to the Construction phase and implementing the community complaints and response procedure from the beginning of construction activities.</p> <p>2. Health Canada suggests that construction noise lasting longer than 1 year be assessed as operational noise, and that noise mitigation measures be applied also to the construction phase. Special consideration should be given to mitigation measures for construction noise that occurs at night, in order to minimize impacts on sleep (i.e., avoiding tonal or impulsive noise sources at night).</p> <p><b>Suggestions for mitigation and follow-up measures:</b> Health Canada recommends use of Appendix H of Health Canada (2017), which identifies additional construction noise</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
						mitigation measures that could also be considered to reduce project- related noise.			
IR-44	-	HC	Physical stressors (noise and vibration)	Section 6.2.8, (p. 6-71)	<p>The noise complaints resolution and response procedure is not sufficiently described in the EIS.</p> <p><b>Context:</b> Section 6.2.8 discusses Monitoring and Follow- up. The Proponent indicates: “The EMS will also include a community complaints and response procedure” (p. 6-71).</p> <p><b>Rationale:</b> Details have not been provided regarding how the complaints would be received, addressed or what the timelines will be for providing a response or resolution. It is important to provide information to potentially affected communities in advance of particularly noisy activities. Community consultation and advanced notification of noisy activities has been shown to reduce complaints (see <a href="#">Health Canada, 2017</a>).</p>	<p>1. Provide the details of the noise complaints resolution and response procedure as per <a href="#">Health Canada (2017)</a>.</p> <p>2. Consider conducting community consultations and/or implementing an advanced community notification system to pro-actively reduce the probability noise-related impacts and complaints.</p>		Accepted	n/a
IR-45	-	HC	Change to an environmental component due to hazardous contaminants	Section 6 Air Quality Technical Supporting Document Section 6.3.1	<p>The carcinogenic risks of diesel exhaust from the Project should be assessed.</p> <p><b>Context:</b> Section 6.3.1 discusses modelled predictions of exceedances for Particulate Matter (PM). TSD p. 22 states: “concentrations of 24-hour PM2.5 are also elevated around the standby generators at the freeze plant, which emit fine particulate matter from combustion of diesel fuel". However, diesel particulate matter is not evaluated for the whole project in the air quality model or the air quality assessment.</p> <p><b>Rationale:</b> Health Canada has determined that diesel exhaust is carcinogenic in humans which is consistent with the conclusion of the International Agency for Research on Cancer (IARC), and that diesel exhaust is associated with significant population health impacts in Canada.</p> <p>To characterize the carcinogenic risk of diesel exhaust from a project, HC has published a report (2022)<sup>1</sup> which provides a quantitative assessment of the relationship between ambient PM2.5 exposure and lung cancer risk. Specifically, this report quantifies the increase in risk of lung cancer mortality (over the baseline rate in the Canadian population) due to PM2.5 exposure.</p> <p>This quantitative assessment is considered appropriate to characterize risks from diesel PM given the contribution of diesel exhaust to ambient PM2.5 in Canada, and that the carcinogenicity of diesel exhaust has generally been evaluated based on the respirable PM fraction<sup>1,2,3</sup>.</p> <p><b>References:</b> [1] HC. 2022. Lung Cancer and Ambient PM2.5 in Canada: A Systematic Review and Meta-analysis. Available at: <a href="https://publications.gc.ca/site/eng/9.907038/publication.html">https://publications.gc.ca/site/eng/9.907038/publication.html</a></p>	<p>1. Evaluate the carcinogenic risk of all potential diesel exhaust from the Project based on the approach proposed by Health Canada (2022). Additional guidance (Additional Lung Cancer Mortality from PM2.5: Recommended Approach and Sample Calculation”) is provided as an appendix to this comment table.<sup>i</sup></p>		Accepted	n/a

IR-46	-	HC	Physical stressors (noise and vibration)	Appendix 6-A Table A-1	<p>Low-frequency noise and associated potential human health effects were not assessed.</p> <p><b>Context:</b> Some equipment that may emit low-frequency noise (LFN) have been listed in Table A-1: Assessment Scenarios and Sound Level Data (Section 6 Appendix A); however, no information describing potential impacts of this type of sound on nearby human receptors are presented.</p> <p><b>Rationale:</b> Low frequency noise can be associated with the introduction of noticeable vibrations and rattles in nearby structures. Research indicates that annoyance related to noise is greater when low-frequency noise is present (ISO 1996-1:2003). As sound environments are usually characterized using A-weighted decibel levels (dBA) that reflect the frequencies most audible to the human ear, the impacts of low- frequency noise may need to be assessed separately.</p>	1. Clarify whether any project-related activities (construction, operation and/or decommissioning) may produce LFN that could impact off-site human receptors. Evaluate LFN in the noise assessment, if and where applicable. See Appendix C of <a href="#">Health Canada (2017)</a> for a discussion of LFN.		Accepted	n/a
IR-47	-	ECCC	Air Quality	Appendix 6-A, A.1	<p><b>Context and Rationale:</b> Verification of the following calculation is required for assessing predicted emissions of dust from general construction. It appears the result of 0.70 ton/acre/month is incorrect and should instead be 0.314 ton/acre/month.</p> <p>Appendix 6-A, Appendix A, A.1 (p. A4) TSP Emission Factor for General Construction:</p> <div><math display="block">EF\ (TSP) = 0.11\ \frac{ton}{acre\ month} \times 1.2\ \frac{ton}{acre\ month} \div 0.42\ \frac{ton}{acre\ month}</math><math display="block">= 0.70\ \frac{ton}{acre\ month}</math></div>	Explain how the emission factor total suspended particulates (EF (TSP)) result was obtained or rectify if it is incorrect and update the draft EIS to reflect the correction.		Accepted	n/a
IR-48	-	HC	Physical stressors (noise and vibration)	Appendix 6-E, Figure 6.2.3, p. 6-57	<p>Noise-sensitive receptors are not included on noise contour maps.</p> <p><b>Context:</b> Noise-sensitive receptors are identified in the acoustic model report in Section 6 Appendix 6-E but not presented on any maps in the atmospheric and acoustic sections of the main report (Figure 6.2-3).</p> <p><b>Rationale:</b> The noise assessment typically includes a map illustrating modelled noise levels from the Project at receptor locations in the study area.</p> <p>Certainty regarding the presence of human receptors in the regional study area is also recommended in order to assess cumulative impacts.</p>	1. For more clarity, identify noise-sensitive receptors on Figure 6.2-3: Noise Assessment Study Area as well as on contour maps showing the baseline and predicted noise levels.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-49	-	HC	Physical stressors (noise and vibration)	Appendix 6-E, 4.0 Table A.1	<p>The Noise Source Characterization is incomplete.</p> <p><b>Context:</b> Section 3.0 of the Draft EIS Section 6 Appendix 6- E discusses Source Characterization. There is no detail regarding potential tonal or impulsive noise sources in Section 3.0.</p> <p><b>Rationale:</b> The draft EIS should include a description of sound source characteristics (e.g., tonal, impulsive, highly impulsive) in order to properly inform the quantitative noise assessment and which assumptions/adjustments need to be applied and to properly evaluate impacts of project noise on health of affected receptors.</p>	1. Identify any tonal, regularly impulsive, highly impulsive, or high-energy impulsive noises likely to be produced during project activities that could be audible at noise sensitive receptors. Furthermore, describe the timing (e.g., hours of night-time activities), frequency and duration of noise events, and their sound characteristics, including frequency spectrum. See <a href="#">Health Canada (2017)</a> for details.		Accepted	n/a
IR-50	-	HC	Physical stressors (noise and vibration)	Appendix 6-E, 4.0 Table A.1	<p>The description of noise modelling does not document or justify the use of sound level adjustments.</p> <p><b>Context:</b> ISO Standard 9613-2 has been used for the sound level modelling; however, it is unclear if all applicable adjustments have been considered as per ISO 1996-1:2016 (Table A.1).</p> <p><b>Rationale:</b> When modelling techniques are used to estimate present (baseline) or future (construction and operational) sound levels, these techniques and any accompanying assumptions, including the use of sound level adjustments, it is important to provide appropriate documentation and justification.</p> <p>Note that in situations where more than one source characteristic adjustment is applicable (e.g., impulsive or tonal), only the higher of the adjustments is used. However, all time-of-day adjustments and the quiet rural area adjustment are to be added to the highest of the applicable source adjustments.</p>	1. Clarify whether ISO-1996-1:2016 has been considered in the modelling to account for any applicable sound level adjustments. Adjustments should be considered when calculating Ln (night- time sound level) and Ldn (day-night sound level). In addition, if applicable, adjustments can be applied depending on the noise characteristic (impulsive, highly impulsive, etc.), and because the Project location is considered to be in a quiet rural area. See: ISO 1996-1:2016 and Health Canada (2017) for details.		Accepted	n/a
IR-51	-	CNSC	Geology and Groundwater	Section 7, Figure 7.8-1  Appendix 7-C	<p><b>Context:</b> Figure 7.8-1 (p. 7-107, main EIS report) shows monitoring well cluster outside of the freeze wall.</p> <p><b>Rationale:</b> It is not clear what the targeted hydro-stratigraphic units of each monitoring well cluster are. In addition, it is not clear how the establishment of the freeze wall and any leakage from the brine solution will be monitored. If there is any “window” within the freeze wall (i.e., the freeze wall is not continuous), is there any way to identify that?</p>	<p>Please clarify the targeted hydro-stratigraphic units of each monitoring well cluster in Figure 7.8-1 (p. 7-107, main EIS report).</p> <p>Please clarify how the establishment of a continuous freeze wall will be monitored.</p>		Accepted	n/a
IR-52	-	ECCC	Fish and fish habitat	Section 7, Geology and Groundwater  Appendix 7	<p><b>Context:</b> According to the Proponent, “an acidic or low pH mining solution will be used to leach uranium ores from the ground. Mining solution may be a mixture of sulphuric acid, hydrogen peroxide, ferric sulphate, and freshwater (from shallow groundwater well or surface waterbody) or recycled water.</p> <p>Wellfield will consist of a combination of injection and recovery wells, in the general the arrangement of one recovery well in the center surrounded by four injection wells (5-spot pattern) with about 5 to 10 m between wells. The final wellfield is expected to include approximately 300 wells over an area measuring 90 m wide x 750 m long”.</p>	<p>1. Explain why 3D hydrogeology and contaminant transport numerical modelling of the injection and extraction wells was not presented.</p> <p>2. Alternatively, provide simulation results and a sensitivity analysis for the injection and extraction of the acidic solution in the mining area.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>As the components/contaminants mentioned in the description of the hydrogeologic contaminant transport processes above may be transported to Whitesfish Lake through groundwater, the injection and recovery wells should be included in the model.</p> <p><b>Rationale:</b> The hydrogeologic contaminant transport processes described above are an important part of the proposed Project and it is not clear why numerical modelling results and a sensitivity analysis for the above processes was not presented.</p>				
IR-53	-	CNSC	Geology and Groundwater	Section 7.3, Table 7.3.-2  Appendix 7-C	<p><b>Context:</b> The field-based hydraulic conductivity values (referred to as K values hereafter) in Table 7.3-2 (p. 7-32, main EIS report) indicate that the K value ranges of upper and lower sandstone aquifers have a significant overlap with those of the intermediate sandstone aquitard.</p> <p>However, the calibrated K value in Table 2-2 (p. 2.7, Appendix 7-C)) for the intermediate sandstone aquitard is close to the lower end of the field-based K value range, while the calibrated K values for the upper and lower sandstone aquifers are close to the upper end of the field-based K value range.</p> <p><b>Rationale:</b> It is not clear how representative the calibrated K values are of the field-based K values for each hydro-stratigraphic unit, and if the significant difference between the K values for the upper and lower sandstone aquifers and those for the intermediate sandstone aquitard is supported by the geological properties of the corresponding stratigraphy units.</p> <p>It is stated in the report (p. 7-36, main EIS report) that “Vertical fracture or fault zones that hydraulically connect the Local (upper) and Semi-Regional (lower) groundwater flow regimes are present throughout the Athabasca Basin”. But fractures and fault zones are not explicitly considered in the model. There is possibility that these features could increase the hydraulic connection between the upper and lower sandstone aquifer.</p>	Please provide additional information to support the representativeness of the calibrated K values (for example, use graph to present the measured K values and the calibrated K values).	<p><i>This IR has been accepted for the purposes of the current EA process, and the outstanding issues below will be further assessed as part of licensing technical reviews, prior to the granting of a Licence.</i></p> <p>Please include figure(s) (y axis representing depth below ground, x axis representing K, different length of vertical line segment representing different packer testing intervals, etc.) showing the field measured K values, as well as the calibrated K value for the upper sandstone aquifer, intermediate aquitard, and lower sandstone aquifer. This would help demonstrate the distribution of field measured K values and representativeness of calibrated K values.</p>	Accepted	n/a
IR-54	-	CNSC	Geology and Groundwater	Section 7.3.1	<p><b>Context:</b> EIS states: “The most important associated topographic features in the region are the northwest to southeast trending drumlins and eskers....” This is not the trend shown on the provided maps, nor described elsewhere in the report, e.g., Section 7.3.2.1</p> <p><b>Rationale:</b> Inaccurate information in the EIS</p>	Please update the EIS where required to accurately describe the topographical features.		Accepted	n/a
IR-55	-	NRCan	Fish and fish habitat	Section 7.3.3.1;  Appendix 7-A, sections 3.4, 3.5, 3.8, 4.2;	<p><b>Context:</b> According to the Proponent's conceptual hydrogeological model (EIS, sec 7.3.3, Figure 7.3-7, Table 7.3-2; Appendix 7-A, sec. 3.4, Table 3-4), the horizontal hydraulic conductivity of the Intermediate Sandstone (Iss) aquitard is 8.4 E-09 m/s based on field measurements. The Proponent further assumes a 10:1 anisotropy ratio for the unit (Appendix 7-A, sec. 3.5.1) such that its estimated vertical conductivity is 8.4 E- 10 m/s. Based on this information, structural geology and groundwater quality data, the Proponent concludes that the connectivity between</p>	In the "Parameter Uncertainty Assessment" for the numerical groundwater flow model (Appendix 7-C, sec. 2.8), NRCan requests that the Proponent develop a calibrated numerical model with an alternate conceptualization of the Intermediate sandstone as a "leaky" aquitard with a horizontal hydraulic conductivity on the order of 1 E-07 m/s and a much lower anisotropy ratio. This should involve modifying the model		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
				Appendix 7-C, section 2.8	<p>the Upper sandstone aquifer and the Intermediate Sandstone aquifer (sic) is limited (EIS sec. 7.3.3.3; Appendix 7-A, sec. 4.4). While acknowledging the paucity of conductivity data and the Proponent's attempt to mitigate this by leveraging collateral information on fracture frequency and clay content (Appendix 7-A, sec. 3.3.1), NRCan considers that the hydraulic conductivity assigned to the Iss aquitard is unrealistically low and inconsistent with the following lines of evidence: a) The conductivity value for the Iss is based on the geometric mean of 18 field measurements, 12 of which are from the same borehole (WR-695) located in the Gryphon zone, beyond the domain of the numerical model (Appendix 7-A, Appendix C, Table C-1). If the conductivity data were weighted equally, with one value per borehole, the geometric mean would be approximately 1.5 E-07 m/s, or two orders of magnitude higher; b) The Proponent notes that vertical fracture or fault zones that hydraulically connect Upper and Lower aquifer systems are present throughout the Athabasca Basin including in the Phoenix area (EIS, sec. 7.3.3.2.2; Appendix 7-A, sec.3.8.1); c) The Proponent notes that groundwater chemistry data (major ions) corroborate the presence of structurally controlled vertical hydraulic connections between the Upper and Lower aquifer systems (EIS, sec. 7.3.3.2.2, sec. 7.3.3.3; Appendix 7-A, 4.3.3); d) Groundwater chemistry data (Appendix 7-A, sec. 4.2, Table 4-1) also indicate the presence of detectable levels of "bomb" tritium (indicating recharge waters &lt; 50 years old) in the Lower Sandstone Aquifer (GWR-025, GWR-008, GWR-033) and in the Iss (GWR-009, GWR-034), outside the area of U mineralization. This is also evidence of vertical hydraulic connection through the Iss. In summary, whereas the Proponent conceptualizes the Iss as a very low-permeability unit with localized vertical hydraulic connection (WS Shear), NRCan interprets the Iss as a "leaky" aquitard with pervasive fracture-controlled and much higher vertical hydraulic conductivity.</p> <p><b>Rationale:</b> The significance of NRCan's alternative interpretation of the Iss hydrostratigraphic unit is that deep groundwaters, including mining-impacted waters, may represent a greater proportion of baseflow discharge to Whitefish Lake than the 1% currently estimated in the Proponent's groundwater flow model (EIS, sec. 7.4.2.1, p.7-51; Appendix 7-C, sec. 2.6.3).</p>	lateral boundary conditions to allow for groundwater inflow/outflow across the entire thickness of the Athabasca Sandstone Group rather than just the Lower Sandstone aquifer.			
IR-56	-	CNSC	Geology and Groundwater	Section 7.3.3.2	<p><b>Context:</b> It is stated in Section 7.3.3.2 (p. 7-37, main EIS report) that “Exploration boreholes drilled in the Phoenix area, where left unplugged, have the potential to provide preferential flow paths between the Overburden and Upper and Lower Sandstone Aquifers. Exploration holes were reportedly grouted approximately 10 to 20 m above and below the ore zone, resulting in open holes remaining throughout the overlying materials. These portions of the open holes may act as open conduits for groundwater flow through the 400 m of Athabasca Group Sandstone.”</p> <p><b>Rationale:</b> It is not clear why the exploration boreholes have not been decommissioned.</p>	Please clarify why the exploration boreholes have not been decommissioned and the timeline to decommission the boreholes according to appropriate guidelines/procedures. If it is not decommissioned before the ISR operation, what is the potential impact of the unplugged boreholes on the mining solution migration?		Accepted	n/a
IR-57	-	NRCan	Fish and fish habitat	Section 7.3.3.2 Appendix 7-A,	<p><b>Context:</b> The Proponent's conceptual model of groundwater flow in the Local Study Area (EIS, sec 7.3.3, Figure 7.3-7) involves an unconfined Upper system hosted by overburden and the Upper sandstone aquifer, and a Lower confined system hosted</p>	In section 2.5.2 of Appendix 7-C (Calibration Results), the Proponent should demonstrate that the numerical groundwater flow model reproduces quantitatively or at least		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
				sections 3.1.2 and 3.7  Appendix 7-C, section 2.5.2	<p>by the Lower Sandstone Aquifer. The Intermediate Sandstone aquitard acts as a confining unit. Vertical heads gradients are directed downwards west of the Phoenix deposit and upwards beneath surface water receptors including Whitefish Lake (EIS, sec. 7.3.3.2).</p> <p>Using head data from nested monitoring wells (Appendix 7-A, sec. 3.1.2, Table 3-1) the Proponent calculates upward gradients in cluster WR-607, between the Lower Sandstone aquifer and the Upper Sandstone aquifer. In cluster LA-5, an upward gradient is calculated between the Upper Sandstone and the overburden unit (Appendix 7-A, Table 3-5). In areas west and south-west of the Phoenix deposit, groundwater is estimated to flow downward under a vertical gradient of approximately 0.015 m/m (Appendix 7-A, p.3-15).</p> <p><b>Rationale:</b> In NRCan's opinion, the Proponent's interpretation of vertical head gradients in the LSA is not fully accurate. For the "Up-Gradient" monitoring well cluster, the tabulated head data (Appendix 7-A, Table 3-1) and data logger hydrographs (Appendix 7-A, Appendix B) indicate a downward gradient (0.014 m/m) from the overburden unit to the Intermediate Sandstone and an upward gradient (0.056 m/m) from the Lower Sandstone to the Intermediate Sandstone. Head data from the "NW" monitoring well cluster indicate a similar pattern of downward (0.016 m/m) and upward (0.014 m/m) gradients converging in the Intermediate Sandstone. In the "Downgradient" and "SE" monitoring well clusters, head observations and data logger hydrographs indicate downward gradients from the shallow aquifer system but essentially equal heads in the Intermediate and Lower Sandstones. This more complex picture of groundwater flow systems in the LSA does not appear to have been captured in the Proponent's conceptual model. Given the importance of the baseline hydrogeological regime for predicting the transport and fate of COPCs in the post-decommissioning period, the Proponent needs to demonstrate that the numerical groundwater flow model accounts for observed vertical head gradients.</p>	qualitatively the vertical head gradients calculated from observations in the nested monitoring well clusters (Appendix 7-A, Table 3-1).			
IR-58	-	ECCC	Fish and fish habitat	Section 7.3.2.4, Ore Deposit	<p><b>Context:</b> The Proponent states that the Phoenix ore bodies are long and narrow (approximately 25 to 50 m wide) and are located within or near a graphitic pelite unit. Hydrothermal alteration associated with the ore zone is a discontinuous envelope of clay alteration and a sulphide-cemented rock zone that extends into the overlying sandstone and the underlying basement (Figure 7.3-3). This black, clay-rich zone is approximately 3 m thick on average and locally hydraulically isolates the ore zone from the overlying sandstones and underlying weathered basement rock.</p> <p><b>Rationale:</b> As indicated by the Proponent, a 3 m black clay rich zone isolates the ore zone from the overlying sandstones and underlying weathered basement rock. It is, however, unclear whether this discontinuous clay layer will prevent downward migration of uranium-bearing solution into the Paleo-weathered basement rock or horizontal flow along the unconformity surface to escape into the environment. Escape of uranium-bearing solution into the environment will have a negative effect on the receiving environment.</p>	<p>1. Verify that there will be no downward migration of mining solution into the paleo- weathered basement rock or that there is no flow along the unconformity surface.</p> <p>2. If downward migration of the mining solution occurs, explain how it will be mitigated.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-59	-	CNSC	Fish and fish habitat	Section 7.4 Assessment of Project-related Effects, Figure 7.4-2 (p. 7-56)	<b>Context:</b> Figure 7.4-2: Simulated Change in Groundwater Discharge and Flow through Whitefish Lake Over the Life of the Project appears to be missing information.  <b>Rationale:</b> Legend is included below the image, but the Legend box is blank. The green dotted line is not represented by anything in the legend.	Please update this Figure to ensure it is complete, and that features are properly indicated in the legend.		Accepted	n/a
IR-60	-	NRCan	Fish and fish habitat	Section 7.4.2.1  Appendix 7-C, section 5.2.1, Appendix B	<b>Context:</b> In the discussion of the limitations of the numerical groundwater flow model (Appendix 7-C, sec. 5.2.1), the Proponent invokes the well known modeling principles of "Occam's razor" and "Parsimony" which guided the parametrization of hydraulic conductivity in model layers. The Proponent states that hydrogeologic property values were applied uniformly for, among other units, the Lower Sandstone aquifer beyond the immediate area of desilicified materials. However, in the layer parametrization for the Lower Sandstone aquifer (Appendix 7-C, Appendix B, Figure B-5), NRCan notes a large zone of enhanced conductivity (1 E-05 m/s) extending south from Kratchkowsky Lake, which contrasts with the value (2 E-07 m/s) assigned elsewhere outside the desilicified zone. NRCan also notes the extremely detailed parametrization of hydraulic conductivity in the clay cap overlying the ore zone where borehole control is dense (Appendix 7-C, Appendix B, Figure B-6).  <b>Rationale:</b> In NRCan's opinion, these model features appear to violate the principle of "Parsimony" and require greater justification supported by field observations.	NRCan requests that the Proponent provide justification based on field evidence for the multiple hydraulic conductivity zones assigned to the Lower Sandstone aquifer and the clay cap above the ore zone.		Accepted	n/a
IR-61	-	CNSC	Geology and Groundwater	Section 7.4.2	<b>Context:</b> There is no discussion of potential induced seismicity from mining processes.  <b>Rationale:</b> Induced seismicity may lead to a loss of process as identified for natural seismicity.	Please provide information on the potential mining-induced seismicity.		Accepted	n/a
IR-62	-	ECCC	Fish and fish habitat	Section 7.4.2, Potential Project-related Effects	<b>Context:</b> The Proponent indicates that the mining area includes: <ul style="list-style-type: none"><li>the 'active mining area', which is the target ore zone;</li><li>a zone extending between 11 and 13 m above the active mining area that represents the maximum vertical height over which the injected mining fluids will migrate upwards from the ore zone during active mining; and</li><li>a zone extending 50 m vertically upwards from the active mining area (that incorporates the active mining area and the 11 to 13 m zone defined in the previous bullet) that was selected to account for potential upset conditions.</li></ul> <b>Rationale:</b> It is not clear to ECCC how the Proponent would be able to limit the mining solution migration within 11 & 13 m above active mining as the maximum vertical height over which the injected mining fluid will migrate. As the mining fluid will be injected under pressure into zones with possible presence of fractures, the pressure may also cause additional fractures and given that the solution is warm/hot will possibly dissolve the other cementing material in the sandstone above, making it difficult to accurately predict where the solution will migrate to.	1. Explain plans to limit the upward migration of mining solution into the overlying layer to 11 and 13m above the ore zone.  2. Explain what impacts will occur if the mining solution migrates beyond the predicted height.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-63	-	CNSC	Geology and groundwater	Section 7.4.2.1, Potential Effect #1: Groundwater Quantity – Construction to Decommissioning  Appendix 7-C, Section 2.7, Groundwater Conditions During Mine Operations	<b>Context:</b> The numerical groundwater model described was calibrated to observed water level and stream baseflow data. Table 7.4-3 in the EIS indicates that Denison recognizes the potential for freeze wall operation to impact groundwater quantity. To simulate this impact, the model was adapted to reduce recharge (to 50%) within the freeze wall area, reduce hydraulic conductivity associated with the vertical freeze walls, and simulate pumping within the freeze wall area. Recovery from pumping and effects on discharge to groundwater discharge to Whitefish Lake are discussed in the potential effects section.  <b>Rationale:</b> Although this assessment considered drawdown of the water table and discharge to Whitefish Lake, the discussion did not address the potential effects of operating the freeze wall on the local and semi-regional groundwater regimes. What would the pathway be for groundwater to pass around the freeze wall? What is the basis for the parameters selected, e.g., 50% recharge and lower hydraulic conductivity for freeze well? These factors need to be considered when evaluating the potential impacts of freeze well operations on groundwater flow conditions and corresponding receptors.	Please provide a more fulsome discussion on the impact of freeze wall operations on local and semi-regional groundwater regimes and potential receptors. Please provide the rationale for assumptions made for key model parameters (e.g., selection of 50% recharge, hydraulic conductivity value used to represent freeze wall). In addition, please discuss the potential pathways for groundwater flow around the freeze wall, complete with figures demonstrating these pathways.		Accepted	n/a
IR-64	-	ECCC  CNSC	Fish and fish habitat	Section: 7.4.2.2, Potential Effect #2: Terrain Morphology and Stability – Operation  Appendix 7-A, Appendix K (p. 12)	<b>Context:</b> The Proponent stated that the geological assessment predicted maximum vertical displacement in altered sandstone immediately above the mining area (17.5 cm). A very minor change in elevation at ground surface (of less than 7.5 cm) was predicted within a discrete and localized area overlying the ore body. The modelling work is considered to provide a worst-case bounding scenario. If subsidence were to occur over the lifetime of the Project, or in the years following mining, the extent of vertical displacement is not expected to exceed that predicted in the modelling, which is based on an assumed volume extraction.  <b>Rationale:</b> ECCC notes that the thickness of the ore zone has an average thickness of 5 m with a range of 2 to 17 m, and is 25-50 m wide and that the overburden rock above the ore zone measures about 400 m. Therefore, it is not clear how the Proponent determined that the surface expression of a subsidence on the surface if it occurs will be limited to 7.5 cm and localized. A subsidence greater than 7.5 cm, implies that the void in the ore zone will be narrower, and will affect the amount of water migrating through the zone.  It was the recommendation of the consultant who conducted the work in Appendix K that more accurate material properties should be used for future modelling.	Explain: <ul style="list-style-type: none"><li>Will this be revisited with updated data based on extraction feasibility results?</li><li>How will the surface expression of a subsidence will be limited to 7.5 cm and localized?</li></ul> <b>Suggestions for mitigation and follow-up measures:</b> ECCC recommends that the Proponent consider implementing remediation measures immediately after mining to prevent subsidence from occurring in the first place.		Accepted	n/a
IR-65	-	CNSC	Geology and Groundwater	Section 7.4.2.2	<b>Context:</b> It is stated the maximum subsidence is 7.5cm based on modeling with an assumed volume extraction. Has subsidence from dewatering/pumping and from lack of inflow of groundwater due to freeze wall been considered?  <b>Rationale:</b> Surface facilities and wells may be impacted if there is unaccounted for subsidence.	Please provide additional details for any dewatering/pumping induced subsidence.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-66	-	CNSC	Geology and Groundwater	Section 7, Table 7.5-1, Row 1, Column 6	<b>Context:</b> Column 6 in Table 7.5-1 indicates the mitigation measures for a valued component. For Row 1, Geology, there is no description of mitigation measures but only that contingency plans will be developed if based on monitoring.  <b>Rationale:</b> Subsidence may impact wells and surface infrastructure.	Please provide additional details on monitoring and contingency plans related to the geological environment (e.g., subsidence), including triggers for implementing such plans.		Accepted	n/a
IR-67	-	CNSC	Geology and groundwater	Section 7.6.2.1 (Remediation Objectives)	<b>Context:</b> Metallurgical testing, including batch reaction, coreflood testing and column tests are mentioned frequently throughout Sections 2 and 7 of the EIS. Outside of the composition of restored solutions from coreflood tests #2B and 3C, results from these various tests are not reported in the EIS or any associated Appendices.  <b>Rationale:</b> The results from metallurgical testing are important to a number of items discussed in the EIS, including (but not limited to): evolution of hydrochemistry during remediation, source of salts in Lower Sandstone Aquifer porewaters, process plans, industrial wastewater treatment, estimating composition and volume of process precipitates, and composition of mining fluids and leachate. In particular, the EIS posits that mining area decommissioning objectives are achievable based on metallurgical testing and provides these objectives in Table 2.3-3. CNSC staff need to understand the specifics of this metallurgical testing, given its importance for the development and justification for mining and remediation activities. Denison must also provide information demonstrating that the proposed restoration actions and remediation targets are As Low As Reasonably Achievable (ALARA).	1. Please provide a summary of the results and the analysis of results of the metallurgical tests within the EIS, or provide the technical supporting document with this information, and ensure the documentation is appropriately referenced in the EIS. This should include sample information for cores (e.g., mineralogy, location, U content, depth), test conditions (e.g., duration, # of iterations, column length, flow rate, temperature, pressure, sample frequency, influent/effluent composition), as well as results and how they are pertinent to the development of ISR activities.  2. Please provide further clarification/justification on how results from two singular coreflood tests (i.e., Coreflood #2B and Coreflood #3C) can justify large-scale remediation activities and targets following solution mining.  3. Please provide material demonstrating that the proposed restoration actions and remediation targets are ALARA.		Accepted	n/a
IR-68	-	NRCan	Fish and fish habitat	Section 7.6.2.2.3  Appendix 7-C, sections 3.3, 4.1, 4.4.4 and 4.7	<b>Context:</b> Sources terms for the COPCs considered in 3D reactive transport modeling are given by the composition of "Restoration Solution #1", which the Proponent believes is representative of groundwater quality in the ore zone after remediation at decommissioning (Appendix 7-C, sec. 3.3, Table 3-5; sec 4.0). The Proponent considers COPC source terms as "initial conditions" for groundwater quality in the ore zone at the start of the model simulation period. During the simulation, no additional mass of COPCs is transferred to groundwater in the ore zone.  <b>Rationale:</b> In NRCan's opinion, this representation of COPC sources is not conservative as it fails to account for various long-term slow mass release processes. These processes could include redissolution of secondary phases formed during ISR mining (e.g., radium-bearing gypsum or barite, jarosite, alunite) and migration of unrecovered lixiviant or restored solution from low-permeability regions or stagnant zones that were not fully swept during mining or remediation. NRCan notes that scenario #2 in the Proponent's transport prediction uncertainty analysis (Appendix 7-C, sec. 4.7) does consider an extended source release period for protons (desorption from chlorite). However, in NRCan's opinion, additional modeling scenarios should consider extended-release periods for other COPCs as well.	NRCan requests that the Proponent's reactive transport prediction uncertainty analysis (Appendix 7-C, sec. 4.7) consider extended source release periods for additional COPCs.		Accepted	n/a
IR-69	-	NRCan	Fish and fish habitat	Section 7.6.2.2.3  Appendix 7-C,	<b>Context:</b> For hydrogeological and geochemical assessments in support of ISR projects, the Proponent identifies two aspects of primary importance (Appendix 7-C, sec. 3.1). These are a) groundwater remediation (Appendix 7-C, sec. 3.1.1); and b) the assimilative capacity of host rocks downgradient from the ore zone (Appendix 7-	NRCan requests that the Proponent provide a detailed description of the expected mineralogical and hydrogeochemical changes occurring within the ore and barrier zones as a result of the injection of acidic lixiviant.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
				sections 3.1 and 3.2	<p>C, sec. 3.1.2). According to the Proponent, the objective of groundwater remediation at decommissioning is to achieve water quality in the mined zone that does not pose a risk to receptors at the point of exposure. Assimilative capacity refers to the ability of groundwater-rock reactions to naturally sequester or attenuate COPCs migrating from the ore zone during the post-decommissioning period.</p> <p><b>Rationale:</b> However, in NRCan's opinion, the Proponent has neglected to mention the most fundamental aspect for hydrogeological and geochemical assessments in support of ISR projects. That aspect is the choice of ISR lixiviant and its effects on the mineralogy and hydrogeochemistry of the ore zone during mining operations. The Proponent provides information on the pre-mining mineralogy (Appendix 7-C, sec. 3.2.1) and hydrogeochemistry (Appendix 7-C, sec. 3.2.2) but no information on their expected changes as a result of ISR mining. This Information is important when considering source terms in reactive transport modeling.</p>				
IR-70	-	CNSC  ECCC	Fish and fish habitat  Geology and groundwater	Section 7.6.2.2.3, Evaluation of Geochemical Reactive Transport  Appendix 7-C, Section 4.4.2, Sub-Domain Model Hydrogeologic Parameters	<p><b>Context:</b> The EIS indicates that “changes to hydrogeological conditions within the mining area were considered during development of the 3D sub-domain model. Dissolution of ore within the active mining area is expected to enhance ... hydraulic conductivity”.</p> <p>In Section 4.7 (Prediction Uncertainty Analysis), predictive uncertainty scenarios are provided. For scenario 7, the hydraulic conductivity (K) of the ore zone was increased even further than initial model assumptions. The value used is not indicated in the text.</p> <p><b>Rationale:</b> A hydraulic conductivity (K) value of 5x10<sup>-6</sup> m/s, which is a factor of five (5) greater than the value assumed for the ore zone, was applied in the base case numerical model to account for this impact. It is unclear from the information provided in Section 7 of the EIS or associated Appendices what the basis of this five-fold increase in K value for the ore zone, and how this was judged to be conservative, or to adequately represent anticipated conditions. This parameter is important as it impacts the rate at which contaminants flow from the ore zone following mining activities. Due to of the dissolution of uranium, larger voids will likely be created, and the hydraulic conductivity may increase by more than a factor of 5 compared to pre-project material. Therefore, a variation of at least one or two orders of magnitude for hydraulic conductivity should be used in the sensitivity analysis. Having a representative, conservative value for hydraulic conductivity is essential for understanding groundwater as a pathway of contaminant transport to Whitefish Lake and potential impacts to aquatic life. The K value used in the predictive uncertainty analysis should be reported.</p>	Please provide a more fulsome discussion on the anticipated impacts of mining on permeability of the ore zone due to mining activities in the EIS or in an Appendix. The value used for scenario 7 of the prediction uncertainty analysis should be provided. The scientific rationale for the use of a K value only a factor of five greater than the value assumed for the ore zone in the 3D regional model should be provided, alternatively, provide simulation results for a more conservative scenario. Specifically, this discussion should address the potential effects of mechanical permeability enhancement with tools, dissolution of ore, gas plugging, chemical plugging, plugging due to ion exchange, and mechanical plugging.		Accepted	n/a
IR-71	-	CNSC	Geology and groundwater	Section 7.7.1, Climate Change Considerations	<p><b>Context:</b> The report states that in a scenario of increased precipitation and decreased/constant evaporation, climate change may result in greater flows in the Wheeler River drainage system and increased recharge to groundwater, which would correspond to increased groundwater discharge to Whitefish Lake. Additionally, it is also stated that climate change was evaluated qualitatively.</p>	Please provide a discussion on potential effects of increased evapotranspiration, as well as decreased groundwater recharge for the study area. Provide justification for performing qualitative assessment of impacts of climate change rather than a quantitative one.	<i>This IR has been accepted for the purposes of the current EA process, and the outstanding issues below will be further assessed as part of licensing technical reviews, prior to the granting of a Licence.</i>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<b>Rationale:</b> It is not clear why the impacts of increased evapotranspiration associated with higher average temperatures were not considered, even though these are likely outcomes of temperature increases due to climate change in areas such as the Prairies (Climate trends and projections - Canada.ca). It is also not clear why climate change considerations were not assessed quantitatively.		The effect of climate change on groundwater recharge in Prairies or Canada is generally uncertain due to the large degree of uncertainty in the modelling of future recharge although future changes in temperature and precipitation are expected to alter groundwater recharge (through changes to runoff, evapotranspiration, and snow accumulation). While CNSC staff accepts the response on potential effects of increased evapotranspiration, as well as decreased groundwater recharge for the study area, no justification has been provided on why quantitative analysis was not completed to address the effect of climate change on groundwater recharge.		
IR-72	-	CNSC	Geology and groundwater	Section 7.8.2, Groundwater Monitoring	<b>Context:</b> Monitoring seems to consider COPCs from surface facilities, and excursion of pumped mine fluid in the Lower Sandstone Aquifer. There does not appear any discussion on how the proposed monitoring program considers potential excursions of brine from freeze wells.  <b>Rationale:</b> It is unclear how potential excursions of brine from freeze wells will be monitored. Would this be through the fiber optic cables installed within the freeze well network? Or would it be achieved in the monitoring well clusters? If this is the case, how would an excursion of brine from a freeze well be differentiated from an excursion of mining solution?	Please provide further information regarding how potential excursions of brine from freeze wells will be monitored as part of the proposed groundwater monitoring program.		Accepted	n/a
IR-73	-	CNSC	Geology and groundwater	Section 7.8.2.2, In Situ Recovery Mining Area  Appendix 7-A, Appendix C	<b>Context:</b> The EIS recommends that a follow-up study be carried out to supplement available data on hydraulic conductivity in the Desilicified Zone (DSZ).  <b>Rationale:</b> Appendix C (Summary of Hydraulic Testing Data and Conductivity Values) of Appendix 7A indicates that only n = 6 hydraulic conductivity values are available for the DSZ, one of which appears unreliable due to a problem with packer sealing. This is relatively few values compared to the Intermediate and Lower Sandstones. Additionally, limited hydraulic head data from boreholes screened in the DSZ is available (GWR-037, GWR-012 and GWR-014; See Figures 16/17 in Appendix 7-A) – most information appears to originate from open core holes. The information presented in its current form is insufficient considering the importance of this zone as a preferential pathway for contaminants following remediation activities, and the heterogeneity of the unit due to intense hydrothermal alteration and fracturing. Further information regarding hydrogeological properties and groundwater flow would aid greatly in validating and refining the numerical groundwater model.	As per the EIS recommendations, please provide additional information to supplement available data on hydraulic conductivity in the DSZ. Please provide the following information as part of the follow-up study: <ol style="list-style-type: none"><li>identification of the vertical conductivity (KV) as there is an upward flow component (isotropy was assumed in DSZ for numerical model, this assumption must be verified)</li><li>quantification of the horizontal and vertical flow gradients in the DSZ; and</li><li>identification and mapping of any structures with the potential to influence groundwater flow in the DSZ, such as fracture/fault zones.</li></ol>		Accepted	n/a
IR-74	-	CNSC	Geology and Groundwater	Section 7.8.2.3	<b>Context:</b> It is stated in Section 7.8.2.3 (p. 7-113, main EIS report) that, at the Post-Decommissioning Stage, “Excursion are signaled by a change in water quality that is outside of that bounded by modelling predictions”, and “The model predictions spatiotemporally bound COPC concentrations in the subsurface that do not pose a risk to the receiving environment. Water quality that is outside of this bounding is defined as representing a material increase over a meaningful period compared to the predicted values either in rate of change or magnitude of change of COPC concentrations.”  <b>Rationale:</b> It is not clear in which locations (e.g., is it in the mining area, or	Please clarify in which locations the water quality data is used to compare with the model predictions to determine if excursion occurs.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					downstream of the mining area, or anywhere else?) the water quality is used to compare with the model predictions to determine if excursion occurs.				
IR-75	-	CNSC	Geology and Groundwater	Appendix 7-A, Appendix K	<p><b>Context:</b> The geomechanical study showed that the stability of the remnant ore zone and surrounding rock mass is highly sensitive to the magnitude of the material properties. To quantify this risk, the Proponent conducted a sensitivity analysis to assess the influence that material properties have on the stability of key stratigraphic layers. The results of the sensitivity analyses suggest that small variations in the cohesion magnitude and angle of internal friction may significantly influence the stability of the altered sandstone, ore zone, and upper and lower clays.</p> <p><b>Rationale:</b> By considering the potential uncertainties and risks in association with the geomechanical study and the empirically derived rock mass strength parameters and the non-site specific physical parameters of different rock formations used for the modeling, the Proponent’s consultant suggests to define a laboratory testing program to address data gaps in the current geotechnical data and increase confidence in the material properties, and use more accurate material properties to model the phased extraction of uranium-enriched rock and assess the associated risks for cavity collapse and failure in the steel casing. CNSC staff concurs with these suggestions.</p>	Please provide a plan to implement recommendations for further detailed geomechanical studies to reduce the uncertainties and risks in association with the stability and deformation analyses of ore zone rock matrix and its overlying rock mass formations and assess their impacts on the mine operation.		Accepted	n/a
IR-76	-	CNSC	Geology and Groundwater	Appendix 7-A, Appendix K (p. 12)	<p><b>Context:</b> Based on the consultant’s report, the modeled vertical strain is approaching or exceeding the tensile and compressive yield limits for steel casing.</p> <p><b>Rationale:</b> Failure of steel casing may result in process loss or alter groundwater flow and quality.</p>	Please provide additional details on how casing integrity will be monitored and potential effects mitigated.		Accepted	n/a
IR-77	-	CNSC	Geology and Groundwater	Appendix 7-A, Appendix K Results of a Geomechanical Study Investigating the Influence of Uranium Extraction on Mining-Cavity Stability for the Wheeler River Uranium Project (Revision 1)	<p><b>Context:</b> It is reported in the appendix K report, within Appendix 7-A, that both phase I scoping analysis and phase II detailed strip model were investigated by numerical modelling. The analysis discussed influence on host rock stability as a result of incremental increase in volumetric extraction and graded conservative treatment of material properties.</p> <p><b>Rationale:</b> As critical components of a numerical geomechanical simulation, initial and boundary conditions are crucially important to the confidence and reliability of the modelling results. However, this information is absent from the current report. In-situ principal stresses largely affects the stability of the excavated host rock, and the vertical strain and surface subsidence. This information is also absent in current form.</p>	Please provide details on the boundary and initial conditions applied on stress loading and strain for the numerical analysis. In particular, the in-situ principal stresses, which are critical to correct understanding of the excavation disturbance to the host rock, should be provided and justified as appropriate.		Accepted	n/a
IR-78	-	CNSC  ECCC	Fish and fish habitat  Geology and groundwater	Appendix 7-A, Section 3.5.2, Porosity	<p><b>Context:</b> This section of the report outlines the estimated/assumed effective porosity values. The only reference provided is for permeameter testing on rock core samples (Scibek, 2019).</p> <p>Additionally, the report states that “As tracer test results to estimate effective porosity were unavailable at the time of modelling, effective porosity values for the</p>	<p>1. Please provide the reference for the data substantiating the assumed effective porosity values reported in Appendix 7-A and used in the numerical model in Appendix 7-C.</p> <p>2. Please provide information on how the site-specific effective porosity values from tracer tests or pumping tests,</p>	<p><i>This IR has been accepted for the purposes of the current EA process, and the outstanding issues below will be further assessed as part of licensing technical reviews, prior to the granting of a Licence.</i></p> <p>Effective porosity is an important parameter to understanding groundwater flow and contaminant transport. The Proponent states that “As tracer test results to</p>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
				Appendix 7-C, Section 2.3.2.1, Porosity Values	<p>sandstone bedrock and basement units were sourced from literature values”, where literature values are effective porosities from the Cigar Lake study (AECL, 1994), situated approximately 40 km NE of Wheeler River. No on-site Wheeler River field data was used to justify this value. Additionally,, in the Cigar Lake study, the authors reported that, because results from tracer tests and pumping tests were unavailable, “a practical approach was adopted, i.e., to use the porosity values obtained from laboratory measurements made on core samples, and to assume that those numbers were close to the average field kinematic (effective) porosity values”.</p> <p><b>Rationale:</b> The source of reported effective porosity values is unclear from Section 3.5.2 in Appendix A (e.g. literature review, field work, laboratory work).</p> <p>In Section 2.3.2.1 of Appendix 7-C, there is a lack of clarity regarding the effective porosity data used in the numerical model. It appears that no site-specific data derived from tracer tests or pumping tests is used in the numerical model. Given that effective porosity directly correlates to seepage velocity and by extension transport time and distribution of COPCs in groundwater, it is an important parameter. Given its relative importance for contaminant fate and transport, effective porosity should be based on field measurements, or at the very least accounted for in the sensitivity analysis.</p>	were considered in the numerical models. Section 2.2.1.4 of the EIS asserts that tracer tests were carried out in 2021 – this information should thus be available for improving/updating models. Alternatively, provide a sensitivity analysis for the effective porosity in the Desilicified Zone, or contaminant transport simulation results with more conservative effective porosity values.	<p>estimate effective porosity were unavailable at the time of modelling, effective porosity values for the sandstone bedrock and basement units were sourced from literature values”, including porosities from the Cigar Lake study (AECL, 1994), situated approximately 40 km NE of Wheeler River. No on-site Wheeler River field data was used to explain this value. Additionally, in the Cigar Lake study, the authors reported that, because results from tracer tests and pumping tests were unavailable, “a practical approach was adopted, i.e., to use the porosity values obtained from laboratory measurements made on core samples, and to assume that those numbers were close to the average field kinematic (effective) porosity values”.</p> <p>In response to the IR, the Proponent explained and supported their methodology for selecting a value for effective porosity. This method included consideration of literature values and a regional analogue at Cigar Lake. ECCC notes that a tracer test was conducted, the results of which were not considered in the selection of the effective porosity parameter.</p> <p>If field test data is available that is potentially relevant to determining effective porosity, it should be included in the EIS when discussing effective porosity. The field test data should also be made available for review by the FIRT, to confirm the conclusions reached by the Proponent. Other sources of information can be useful when explaining the most appropriate value for effective porosity such as literature values and regional analogues, as per the Proponent’s IR response. However, field test results should be presented in the EIS and considered as a part of such an explanation. If the Proponent feels that not utilizing field test data is the most accurate approach when selecting an effective porosity value, then this conclusion should be reached with consideration of the field test data as a part of the evaluation.</p> <p>Provide a discussion of how the effective porosity values are selected, including a discussion of how field test results were considered. This information is necessary to confirm that the selected effective porosity values are valid. This also relates to IR-52.</p>		
IR-79	-	CNSC	Geology and groundwater	Appendix 7-A, Section 4, Groundwater Chemistry	<p><b>Context:</b> Table 4-1 in Section 4 of Appendix 7-A provides groundwater monitoring results from sampling activities carried out at 26 monitoring wells in 2019, 2020, and 2021. The majority of these wells were only sampled once (n = 8) or twice (n = 17). In some cases (Lower Sandstone Aquifer/Intermediate Sandstone Aquitard), the variability of results between sampling events is quite high. Data for the Paleoweathered Zone is sparse.</p> <p><b>Rationale:</b> Insufficient information is presented in the EIS and associated Appendices to concretely define baseline groundwater chemistry for the different hydrostratigraphic units. As defined in the CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a>: “Based on the scope of the project, the EIS will present sufficiently detailed baseline information to determine the effects the project could have on the VCs and analyze those effects”. This is particularly important given</p>	Please provide the statistical basis (number of samples and variability) by which “baseline” is defined and the justification that the current information is sufficient to adequately characterize groundwater quality. In order to ensure sufficient baseline information is collected, further iterations of sample collection for groundwater monitoring wells in all defined hydrostratigraphic units may be required. In addition, groundwater quality downgradient from the proposed mining area should be further characterized to assess spatial influence of alteration and hydraulically active features,		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					certain features of the study area (i.e., presence of zones of thermal alteration/desilicification, as well as hydraulically active fractures/faults), and the need to adequately characterize baseline conditions in the Desilicified Zone downgradient from the proposed mining area. As an example, the US Nuclear Regulatory Commission (NRC) typically requires a minimum of four (4) quarterly samples from (i) surficial aquifers, (ii) production aquifers, (iii) overlying aquifers, and (iv) underlying aquifers to characterize preoperational groundwater quality (E. Striz, pers. comm.).				
IR-80	-	CNSC	Geology and groundwater	Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit	<p><b>Context:</b> This section provides data for groundwater samples collected during the Cigar Lake analogue study and Millennium Project for further regional context. The previous studies are heavily referenced to support interpretations made for the conceptual site model.</p> <p><b>Rationale:</b> The Piper Plots in Figure 26 are difficult to interpret (many overlapping circles with variegated colors), and Cigar Lake samples plot predominantly as Na/K-Cl/SO4 groundwater facies. Conversely, samples collected as part of the Phoenix Project (current), plot either as Ca-HCO3 or Ca-SO4/Cl groundwater facies. No explanation is provided for the observed hydrogeochemical differences between groundwater from the Phoenix project and the Cigar Lake analogue study/Millennium Project.</p>	Please provide additional clarity to and interpretation of Figure 26 in Appendix 7-A, including a revision to the Figure to allow for easier interpretation. This could include clear identification of end members, as well as arrows indicating proposed evolution of groundwater chemistry. Further discussion should be provided describing observed differences between groundwater chemistry at the Phoenix project compared to Millenium/Cigar Lake.		Accepted	n/a
IR-81	-	CNSC	Geology and groundwater	Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit	<p><b>Context:</b> The report states in the description of hydrochemistry of the Lower Sandstone Aquifer that, “On the basis of groundwater chemistry and tritium values in that groundwater, the authors (of the Cigar Lake analogue study in 1994) concluded that the groundwater reflected a younger water component that had penetrated to depth along hydraulically active fractures/faults. The same conclusion is made here (in the Wheeler River EIS) for the Phoenix study area – meaning that fracture/fault conditions are such that some areas of the MFa are characterized by younger/recharge groundwaters”.</p> <p><b>Rationale:</b> Tritium results for most wells in the Lower Sandstone Aquifer (MFa) reported in Table 4-1 of Appendix 7-A exhibit tritium concentrations &lt;15 Bq/L for the 2020 sample, and 0.1 or &lt;0.1 Bq/L for the 2021 sample. Tritium in modern precipitation typically varies from 1 – 3 Bq/L. Conclusions made in the text are not supported by data, especially given that tritium values are not reported in the EIS for local precipitation or surface water. This is important in reinforcing the assumption from the conceptual model that modern meteoric water circulates at depth in the Lower Sandstone Aquifer.</p>	Provide a further discussion on the interpretation of tritium in groundwater, rather than echoing conclusions from the Cigar Lake analogue study. Consideration should be given to the assertion that modern meteoric water circulates at depth in the Lower Sandstone Aquifer. Collection and analysis of stable isotope (e.g., δ2H, δ18O) samples is a cost-effective solution which would greatly improve understanding of groundwater hydrology and support the development of a conceptual model.		Accepted	n/a
IR-82	-	CNSC	Geology and groundwater	Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit	<p><b>Context:</b> A. In-field measurements of Oxidation-Reduction Potential (ORP) for three (3) out of twenty-six (26) groundwater samples are presented in Table 4-1 of Appendix 7-A. Although sparse, these values are also used to characterize redox conditions for representative groundwaters in Table 3-5 of Appendix 7-C.</p> <p>B. In Section 3.5.5 of Appendix 7-C it is stated that groundwaters in the PHREEQC model were allowed to equilibrate with atmospheric concentrations of oxygen,</p>	1. Provide further discussions and information (i.e., ORP measurements or analytical data for redox couples) on redox conditions at the Phoenix site. Particular focus should be given to the spatial heterogeneity of redox processes. Tools such as the reference provided [2] below provide an example of simplified framework for characterizing redox conditions in aquifers.	Please see AD-65 in the Advice to Proponent table.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
				Appendix 7-C, Section 3.5	<p>resulting in oxidizing subsurface conditions. In Section 3.7 of Appendix 7-C it states that input files for 3D reactive transport were generated based on outcomes for PHREEQC modelling. However, in reading Section 4 of Appendix 7-C, it is unclear whether this assumption (equilibration with atmospheric oxygen) was carried forward for the 3D model.</p> <p>C. As per p. 3.49 of Appendix 7-C, “A small amount of reactive pyrite was assumed for the first 500 m of transport away from the ore zone in the model, primarily in the desilicified sediments of the Lower Sandstone Aquifer, and deeper portion of the Intermediate Sandstone Aquitard”.</p> <p><b>Rationale:</b> A. Given the importance of redox conditions for U mobilization and precipitation/dissolution of minerals (e.g., pyrite/metal oxyhydroxides) and the corresponding influence on contaminant transport from both a modelling and monitoring perspective, these should be further characterized. It should also be noted that the measurement of Oxidative-Reductive Potential (ORP) in natural waters can be complex and difficult due to the variability and disequilibrium of natural systems and issues inherent to electrode calibration (e.g., Schuring et al., 2000). Measurements of redox couples (e.g., As(III)/As(V); Fe(II)/Fe(III); S(-II)/S(VI)) are typically recommended to accurately characterize redox conditions in natural waters (Schuring et al., 2000).</p> <p>B. The assumptions regarding redox conditions for the 3D solute transport model should be clarified.</p> <p>C. The amount of pyrite (e.g., % by weight) assumed for the purposes of modelling should be clarified, given the potential role of pyrite as a reducing agent in limiting the transport of COPCs.</p> <p><b>Reference:</b> [1] Schuring J.; Schulz, H. D.; Fischer, W.R.; Bottcher, J.; and Duijnisveld, M.H.W. 2000. Redox: Fundamentals, Processes and Applications. Springer: Berlin.</p>	<p>2. Clarify assumptions regarding initial redox conditions for the 3D solute transport model.</p> <p>3. Provide the % reactive pyrite by weight assumed for models in the text. Justification for proportions used, such as analytical data, should also be provided.</p> <p><b>Reference:</b> [2] Jurgens, B.C., McMahon, P.B., Chapelle, F.H., and Eberts, S.M., 2009, An Excel workbook for identifying redox processes in ground water: U.S. Geological Survey Open-File Report 2009–1004 8 p.</p>			
IR-83	-	CNSC	Geology and Groundwater	Appendix 7-A, Section 7.4.2.2 and Appendix K	<p><b>Context:</b> Leaching of uranium from the ore zone will generate voids within the ore zone, which could fail and collapse. Failure of the voids would cause displacement in overlying rocks, which will lead to the eventual ground subsidence. Based on the developed geological model, a geomechanical study was conducted to assess potential maximum vertical displacement in the overlying rock formations and predict the ground subsidence. While a layer of altered sandstone is modeled above the ore zone, the desilicified zone, a zone that is comprised of completely to partially unconsolidated sands and has very low rock quality, high fracture intensity, and high friability, and low strength in the area overlying and east of the Phoenix deposit, appears not to have been included in the model for geomechanical modeling. The evaluated displacement/deformation in the overlying rock formation and the resulted ground subsidence would not be conservative without including the desilicified zone.</p>	<p>Please provide details whether and how the desilicified zone is considered in the geomechanical modeling of the detailed strip model. Such details should include figures and the linkage between the geomechanical model including the determination of strength parameters of the desilicified zone and the geological model including information on the core delineation of the desilicified zone.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<b>Rationale:</b> Stability of the ore zone rock matrix and the potential displacement/deformation in the overlying rock formations when voids in the extracted ore zone collapse are critical for protecting the overlying aquifers, preventing substantial ground subsidence, safeguarding casing integrity, and mitigating plug-off of the remaining ore as well as efficiently mining extraction. The deformed zone in the overlying rock formations will change in hydraulic conductivity that will impact on the assessment of potential effects on groundwater flow and contaminant transport in the zone. Therefore, the rock mass behavior including and above the ore zone should be adequately understood and the potential displacement/deformation should be assessed and quantified with adequately defined geological model.				
IR-84	-	CNSC	Geology and Groundwater	Appendix 7-C	<b>Context:</b> It is stated in Section 2.5.2.4 (p. 2.35, Appendix 7-C) that “In addition to calibrating to water level elevations targets, the model was calibrated to estimates of groundwater discharge to Whitefish Lake. A match between simulated and observed flows helps to support that groundwater recharge rates are reasonable, and to provide validation for water budget assessments. Baseflow calibration targets were developed using point streamflow measurements collected upstream and downstream of Whitefish Lake. Figure 2-10 (p. 2.26, Appendix 7-C) shows the locations of the baseflow calibration targets, and Table 2-7 (p. 2.35, Appendix 7-C) illustrates the model-simulated groundwater discharge rates in relation to the estimated range of baseflow from stream measurements. The simulated baseflow to Whitefish Lake is in good agreement with the estimated representative baseflow”.  <b>Rationale:</b> It is not clear in Figure 2-10 (p. 2.26, Appendix 7-C) where the point streamflow measurements were conducted upstream and downstream of Whitefish Lake. Additionally, it is not clear how the groundwater discharge to Whitefish Lake is simulated, since the model domain does not cover the whole Whitefish Lake.	1. Please clarify in Figure 2-10 where the point streamflow measurements were conducted upstream and downstream of Whitefish Lake. 2. Please clarify how the groundwater discharge to Whitefish Lake is simulated considering that the model domain does not cover the whole Whitefish Lake.		Accepted	n/a
IR-85	-	CNSC	Geology and Groundwater	Appendix 7-C	<b>Context:</b> Section 2.7.3 (Appendix 7-C) mentions Wells A, B and C, and Figure 2-17 (p. 2.43, Appendix 7-C) illustrates the predicted drawdown ranges at Well B and Well C.  <b>Rationale:</b> It is not clear where Well A, Well B and Well C are located.	Please provide the locations of Well A, Well B and Well C illustrated in a Figure.		Accepted	n/a
IR-86	-	CNSC	Geology and Groundwater	Appendix 7-C	<b>Context:</b> It is stated in Section 2.7.3 (p. 2.41, Appendix 7-C) that “Both the pumping demand and the recharge changes were incorporated into a transient simulation performed using the calibrated groundwater flow model. The model simulation was started at the beginning of mine construction, with initial conditions taken from the calibrated model. The simulation period was extended for 40 years to include the entire period of construction, operation, and decommissioning, and extending through 17 years post decommissioning”.  <b>Rationale:</b> It is not clear what is the difference between the calibrated model and transient model in terms of parameters (such as the K values for the mining zone), boundary conditions, etc.	Please clarify the parameters, boundary conditions and any other aspects as used in the transient model that are different from the calibrated model.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-87	-	CNSC	Geology and Groundwater	Appendix 7-C	<p><b>Context:</b> In Section 2.8 (p. 2.45, Appendix 7-C) Parameter uncertainty assessment, only parameters for certain zones (part of each specific hydro-stratigraphic unit as shown in Figure 2-19, p. 2.46, Appendix 7-C) related to the pathway from the ore zone toward Whitefish Lake were allowed to vary in order to find combinations of parameter values that met statistical calibration criteria. If each hydro-stratigraphic units within the whole model domain were treated as parameter zones that can have varied hydraulic conductivity values, a different combination of parameter values could be obtained that meet statistical calibration criteria too.</p> <p><b>Rationale:</b> The parameter values for parameter zones between the mining area and Whitefish Lake is important in determining the hydraulic connection between the mining area and Whitefish Lake. Parameter values in other parameter zones could also be important. For example, if the K values for the intermediate sandstone aquitard are significantly larger than in the current calibration results, the interaction between the upper sandstone aquifer and the lower sandstone aquifer could be more active, and the mined-out zone could be more active hydraulically and groundwater in the minded-out zone could have a shorter residence time than in the current calibrated model.</p> <p>Additionally, it is noted that Figure 2.19 (p. 2.46, Appendix 7-C) illustrates the parameter zone for the intermediate sandstone aquitard. However, Figure 2.20 (p. 2.49, Appendix 7-C) did not include the intermediate sandstone aquitard in the results.</p>	It is recommended that the parameter zones in the Parameter uncertainty assessment include hydro-stratigraphic units in the whole model domain to investigate the possible combination of parameter values that could make the groundwater in the mined-out zone more active hydraulically.		Accepted	n/a
IR-88	-	CNSC	Geology and Groundwater	Appendix 7-C	<p><b>Context:</b> The conceptual hydrogeological model includes upper sandstone aquifer, intermediate sandstone aquitard, and lower sandstone aquifer. The desilicified zone above the ore zone have enhanced hydraulic conductivity. The boundary condition for the lower sandstone aquifer on the west (upstream) side was assigned to have specified head, which provide source of water for the lower sandstone aquifer.</p> <p>As a result of the conceptual model setup, the upper sandstone aquifer is hydraulically active and the groundwater residence time within the upper sandstone aquifer is relative short. In contrast, the lower sandstone aquifer (and the ore zone) is hydraulically inactive, and the groundwater residence time in the lower sandstone aquifer is relatively long (as shown in the particle tracking results in Figure 7.6-2 (p. 7-71, main EIS report), and the simulated plume for chloride in Figure 7.6-7(p. 7-86, main EIS report)).</p> <p>It is stated in Section 2.6.4 (Appendix 7-C) that “As noted above in section 2.6.3, it is estimated that 99% of the groundwater discharge to Whitefish Lake is derived from groundwater that has only flowed through shallow deposits (i.e., Overburden and Upper Sandstone Aquifers). Contribution of deep groundwater flow through the Desilicified Zone within the Intermediate Sandstone Aquitard is estimated to be &lt; 1% of the groundwater discharging to Whitefish Lake”. This simulation result is reflective of the conceptual model.</p>	It is recommended to conduct the following work to demonstrate if the mined-out zone is hydraulically active: <ol style="list-style-type: none"><li>Determine the groundwater residence time in the lower sandstone aquifer and compare it with the simulated residence time in the numerical model.</li><li>Conduct additional particle tracking to demonstrate where groundwater originating from the mined-out zone flow towards (forward tracking) and where groundwater flowing towards the mined-out zone originates from. This would help determine why groundwater in the mined-out zone is not hydraulically active.</li><li>Conduct sensitivity analysis to investigate the effect of higher K values for the intermediate sandstone aquitard and the K and porosity values of the mined-out zone on the plume migration.</li></ol>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>Section 7.3.3.3 (p. 7-42) states that “The Lower Sandstone Aquifer is characterized spatially by two types of groundwater. The first groundwater type is most like that observed in the Local Flow System. This reflects hydraulically active fractures and fault systems that allow fresh recharge water to penetrate and mix with deeper waters in the aquifer. The second type of groundwater is within the zone of thermal alteration around the ore zone .....”.</p> <p>The hydraulic connectivity of the ore zone with the upper sandstone aquifer has important implication on the groundwater restoration. The ore zone is not hydraulically active locally because it is enclosed by a clay zone before the mining operation. But if it is located within a hydraulically active area, or on a groundwater flow pathway that is hydraulically active, the mined-out zone (with much larger porosity and hydraulic conductivity) could become active hydraulically after mining operation is finished.</p> <p>Figure 7.6-7 (p. 7-86, main EIS report) shows that the chloride plume is most persistent within the mined-out mining area. This seems to indicate the mined-out zone is hydraulically inactive after the mining operation is finished.</p> <p>It is stated in Section 7.3.3.2 (p. 7-37, main EIS report) that “Exploration boreholes drilled in the Phoenix area, where left unplugged, have the potential to provide preferential flow paths between the Overburden and Upper and Lower Sandstone Aquifers. Exploration holes were reportedly grouted approximately 10 to 20 m above and below the ore zone, resulting in open holes remaining throughout the overlying materials. These portions of the open holes may act as open conduits for groundwater flow through the 400 m of Athabasca Group Sandstone.” So, there is possibility that the unplugged borehole could increase the hydraulic connection between the upper and lower sandstone aquifer.</p> <p><b>Rationale:</b> It is important to understand if the larger area containing ore zone is hydraulically active. Additional confidence would be gained if there is any other evidence that support that the area containing the ore zone is not hydraulically active, and groundwater residence time in the lower sandstone aquifer surrounding the ore zone is comparable with the simulated results.</p> <p>Table 2-4 (p. 2.16, Appendix 7-C) shows the effective porosity (0.01-0.05) of the ore body. Figure B7 (p. B.8, Appendix 7-C) shows that the calibrated K values for the mined-out zone is 1x10-6 m/s. Section 3.5.2 (p. 3.24, Appendix 7-C) states that “The same average linear velocity was assumed for the mining area (source zone), following from the discussion in Section 4.4.2, where the hydraulic conductivity value in this zone following mining was set to 5x10-6 m/s, and a porosity of 0.2 is assumed for the ore zone (Table 4-2)”. It is not clear what the justification is for the selection of the porosity and K values for the mined-out area, and whether they are conservative. It is also not clear, what the potential impact on the groundwater flow and COPCs transport would be If the mined-out zones collapse.</p>				

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-89	-	ECCC	Fish and fish habitat	Appendix 7-C, Numerical Modelling: Post-Decommissioning Evaluation, Section 2.3.1.4, Desilicified Zone	<p><b>Context:</b> The Proponent states that a hydraulic conductivity value of 5x10-6 m/s was uniformly assigned to the model layers representing the Desilicified Zone. They additionally state that this value is consistent with packer and pumping tests screened in this unit that have interpreted hydraulic conductivity values ranging from 1x10-6 to 3x10-5 m/s (Appendix C), with a geomean of 6.0x10-6 m/s.</p> <p>Considering that the Desilicified Zone is of particular interest because it is the main pathway for the COPC to reach Whitefish lake, and that hydraulic conductivities are not entirely understood, ECCC recommends that a larger range of hydraulic conductivities be simulated to understand potential effects on fish and fish habitat.</p> <p><b>Rationale:</b> The Desilicified Zone is a critical layer in the hydrogeological model as it represents a key potential pathway of contaminants to Whitefish Lake. The base case hydraulic conductivity value (5x10-6 m/s) is even lower than the geometric mean, not to mention the highest value found. When simulating geochemical processes and contaminant transport within this important pathway a more conservative approach should be employed. Modifying this parameter will affect travel times and distribution of COPC in the subsurface.</p>	<p>1. Provide an in-depth rationale for choosing a value of 5x10-6 m/s as the base case for the hydraulic conductivity, in both the PH REDox EQUilibrium (PHREEQC) and Finite-Element Ground Water Flow (FEFLOW) models.</p> <p>2. Provide a rationale for keeping the sensitivity analysis within one order of magnitude considering the lack of physical data on the Desilicified Zone. Alternatively, provide contaminant transport simulation results with more conservative hydraulic conductivity (e.g., more than 3x10-5 m/s) values in the Desilicified Zone.</p> <p>See also related: IR-96.</p>	<p>The Desilicified Zone is a critical layer in the hydrogeological model because it represents a key potential pathway of contaminants to Whitefish Lake. There is a limited amount of field data for the Desilicified zone. A sensitivity analysis should allow the model to test slightly outside of the observed field data values.</p> <p>Following a supplementary submission provided by Denison on July 2<sup>nd</sup>, this IR is accepted for the purposes of the EA review, subject to the addition of a commitment to:</p> <ul style="list-style-type: none"><li>revisiting and updating the groundwater models as necessary, as more data becomes available through the EA follow-up monitoring program to improve confidence on the hydraulic values of the desilicified zone.</li></ul> <p>This commitment must be provided in the updated commitment report, as part of the final EIS submission package. Denison should also take this commitment into account when developing the EA follow-up monitoring program.</p>	Accepted	n/a
IR-89	IR-89-R1	ECCC	Fish and fish habitat	Appendix 7-C, Numerical Modelling: Post-Decommissioning Evaluation, Section 2.3.1.4, Desilicified Zone  IR-89 Response from Denison	<p><b>Context:</b> The Proponent states that the range of hydraulic conductivities considered in sensitivity analysis was limited to values that fit within a calibration constrained uncertainty analysis of the model.</p> <p>Considering that the Desilicified Zone is of particular interest because it is the main pathway for the COPC to reach Whitefish lake, and that hydraulic conductivities are not entirely understood, ECCC recommends that a larger range of hydraulic conductivities be simulated to understand potential effects on the aquatic environment.</p> <p>The Proponent clarified the details of the calibration-constrained uncertainty analysis that was used for parameter bounding within the model, with hydraulic conductivity sensitivity bounds determined based on model calibration values that were supported by the available physical data.</p> <p><b>Rationale:</b> ECCC agrees that calibration constrained uncertainty analysis using hydraulic head field data is useful to determine probable upper limits of K values. However, there is always some degree of uncertainty in groundwater data and models. Sources of such uncertainty may include errors, lack of complete and representative field data to determine key parameters, or any number of heterogeneities associated with groundwater systems over large scales. Such uncertainties will always exist and can be accounted for by conducting a sensitivity analysis that accounts for the lack of physical data in the Desilicified Zone by running modelling scenarios using parameters that are outside of the calibration constrained values.</p>	Expand the sensitivity analysis of hydraulic conductivity outside of calibration constrained parameters to account for the lack of physical data in the Desilicified Zone.	See IR-89 (above).	Accepted	n/a
IR-90	-	ECCC	Fish and fish habitat	Appendix 7-C, Section 2.4 and 2.6	<p><b>Context:</b> Hydraulic conductivities and hydraulic gradients play an important role in groundwater flow, geochemical modeling, and contaminant transport for the PHREEQC and FEFLOW models. Although there is an important vertical component</p>	1. Explain if the vertical and lateral hydraulic gradients and hydraulic conductivities are assumed to be equivalent.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>to the contaminant transport, there is no distinction made between lateral and vertical hydraulic conductivities of hydraulic gradients.</p> <p><b>Rationale:</b> According to the conceptual model, there is an important vertical aspect to the groundwater flow thus incorporating any vertical hydraulic gradient or hydraulic conductivity information into the calibration would increase confidence in the results.</p> <p>Providing a distinct value for vertical hydraulic conductivity will improve the accuracy of the model in regards to the transport of contaminants to Whitefish Lake through the Desilicified zone, which is important to understand potential impacts to aquatic life.</p>	<p>2. Provide a rationale for not distinguishing between vertical and lateral hydraulic gradients.</p> <p>3. Alternatively, provide both lateral and vertical hydraulic gradient estimates and the implications on contaminant transport.</p>			
IR-91	-	NRCan	Fish and fish habitat	Appendix 7-C, section 2.5.2	<p><b>Context:</b> The numerical model calibration quality plot (Appendix 7-C, sec. 2.5.2.1, Figure 2-13) contains a small error. The vertical (simulated heads) and horizontal (observed heads) axes do not have the same scales (499 to 521 masl versus 499 to 522 masl). Therefore, the line of ideal fit is offset.</p> <p><b>Rationale:</b> As a result, NRCan notes that observed heads in the 510-512 masl range are underpredicted by the model. NRCan also notes that the calibration statistics (Appendix 7-C, sec.2.5.2.3) are highly leveraged by two data points from open boreholes south of Kratchkowsky Lake where simulated values are largely controlled by the nearby constant-head boundary in the Lower Sandstone aquifer (520 masl).</p>	The Proponent should correct the scales on the axes of Figure 2-13 in Appendix 7-C. The Proponent should also comment on the effect on calibration of the clustering of most observation wells in the ore zone.		Accepted	n/a
IR-92	-	CNSC	Geology and groundwater	Appendix 7-C, Section 3.2.1, Mineralogical Composition	<p><b>Context:</b> Table 3-2 summarizes the clay content of the Athabasca Group sandstones and the Paleoweathered Zone. Although minimum, maximum and median values are provided, the number of samples and variability of the dataset are not. Rationale for incorporating illite into reactive transport modelling and excluding kaolinite/dichlorite is provided in the text.</p> <p>From p. 3.29 in Appendix 7-C: “The illite content was based on the normative clay composition determined from site-specific corehole elemental analysis (median illite by mass is 7.68%; Table 3-2) and using portable infra-red mineral analysis indicating median illite content by mass is 13.1% (data not shown)”</p> <p>From p. 3.30 in Appendix 7-C: “Using the minor amount of illite compared to the more dominant chlorite is conservative in that not all sorptive capacity of the clays is accounted for in the simulated paleoweathered zone”. This conservative assumption appears contrary to assumptions for the desilicified zone (DSZ) and Athabasca Group sandstones “Illite was used to represent the total clay content, which varies from 1.74% to 5.85% by mass in the hydrostratigraphic units within the Athabasca Group sandstones and Desilicified Zone”.</p> <p><b>Rationale:</b> Information is missing in the EIS regarding the clay composition of hydrostratigraphic units. Results from infrared mineral analysis are not reported.</p>	<p>1. Please provide in Table 3- the number of samples and variability of the datasets used to estimate the clay content of hydrostratigraphic units for the model. Include results from infrared mineral analysis in the text if the information is used to support assumptions for modelling.</p> <p>2. Please provide further information/discussion within the EIS relating to the assumptions of clay content in hydrostratigraphic units for modelling. Provide further justification and rationale as to why total clay content in the Athabasca Group sandstones and Desilicified Zone is assumed to be illite, and how this assumption is conservative. This discussion could include a comparison of the properties (cation exchange capacity, surface area) of illite vs. kaolinite vs. dichlorite for the anticipated range of subsurface conditions (pH, redox, U concentrations, etc.).</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					The assumption for the solute transport model is that all clays in the downgradient DSZ are illite. However, clay content in the Read Formation (Lower Sandstone Aquifer) downgradient of the ore zone is low in illite (0.42%) compared to kaolinite (0.52%) and dichlorite (1.18%). A value of 3.9% illite clay by weight is used for the DSZ, but Table 3-2 indicates median content is 2.42% illite. It is not clear why illite was used to represent total clay content for the DSZ, as opposed to the conservative assumptions used for the Paleoweathered Zone, nor has any basis or justification been given.				
IR-93	-	CNSC	Geology and Groundwater	Appendix 7-C, Table 3-10: Properties of Adsorbing Mineral Phases	<p><b>Context:</b> In Appendix 7-C, section 3.5.6.2.2 Ion Exchange and Surface Complexation, the consideration of ion exchange and surface complexation and the corresponding parameters and chemical reaction are discussed.</p> <p><b>Rationale:</b> The site density of sorbent Geothite was reported in Table 3-10 to be 1.6E3 mol/kg. Taking into account the specific surface area of 60 m2/g, this equals to 1600/6E4 mol/m2, or 0.0266 mol/m2, 1.6e4 sites/nm2.</p> <p>This value largely overestimates the site density of goethite, which is reported to be in the range of 2~6 sites/nm2. The reference used in the EIS report indicates the similar range of variation for this specific parameter.</p> <p>There are plenty of similar studies on SCM of iron oxides in literature. It is suggested to consult with more than one single study to enhance the reliability of model parameters.</p> <p>The overestimation of sorption site density will directly result in underestimation of the affected COPCs’ concentrations in pore fluid. This will result in underestimation of COPC transport plume in the affected underground space, and potentially the dissolved concentrations in the hydrogeological sink.</p>	Please provide additional evidence to justify the model parameter of site density for goethite, applied to the numerical model. If necessary, the reactive transport modelling should be re-run to update the contents presented in the EIS report.		Accepted	n/a
IR-94	-	CNSC	Geology and Groundwater	Appendix 7-C, Numerical modelling: post-decommissioning evaluation, Section 3.5.5, Subsurface Conditions Incorporated	<p><b>Context:</b> It is reported in this section the assumed subsurface conditions that were applied in the geochemical site conceptual models. Critical phenomenon of pH tail was mentioned. Inclusion and exclusion of corresponding geochemical reactions were discussed briefly.</p> <p><b>Rationale:</b> It was reported that the residual reduced minerals of uraninite and pyrite were not included in the modelling of the remediated mining area. The argument was based on consideration of the upstream groundwater, passing through the mined zone, will not be oxidizing and groundwater conditions are expected to be similar to pre-mine conditions. However, this ignores the pH tail effect that releases proton H+ sorbed to solid surface during ISR flooding. By ignoring this process, there is a potential risk of underestimating the source terms for some key COPCs. Exclusion of uraninite and pyrite in remediated mining area modelling is contradictory to pH-tail effect. The justification is not sufficient in the current form.</p>	Please provide additional evidence to justify the approach for excluding uraninite and pyrite from the analysis of remediated mining area. This may require the results from additional modelling.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-95	-	CNSC	Geology and Groundwater	Appendix 7-C, Table 3-11	<p><b>Context:</b> The Table 3-11 reported the Solid-Phase Concentrations and Partitioning Constants for COPCs. Data were both measured and simulated.</p> <p><b>Rationale:</b> It is unclear how the partition coefficients of various COPCs upon desilicified and paleoweathered rocks were obtained. It was not reported at what pH were these <math>K_d</math> analyzed. Sorption of chemicals on solid phase is known to be pH dependent. It is unclear whether pH influence was considered in the measurement and analysis of apparent partition coefficients.</p> <p>In addition, uptake of metals on clay is highly nonlinear, and always has a maximum capacity. Even with a very strong affinity towards specific metal ions, the sorption will be saturated at elevated concentrations. Therefore, assuming a linear correlation needs to be cautious of the concentration range of target COPC species, and the applicable sorption capacity of the clay mineral.</p> <p>In the current model, only the linear form of sorption is considered, although with discussion of <math>K_d</math> value selection. Additional rationale is needed to justify if the applied methodology is sufficient for assessment.</p>	Please justify the choice of applying a linear form partition coefficient for the modelling and assessment, and whether it provides a conservative approach to the assessment results. Clarity around the experimental conditions during the measurement of partitioning coefficient of various COPCs on the target rocks may help support this assumption.		Accepted	n/a
IR-96	-	CNSC	Geology and groundwater	Appendix 7-C, Section 4.4.4, Sub-Domain Model Transport Boundary Conditions	<p><b>Context:</b> From the text, “Transport parameters were specified for diffusion (1x10<sup>-9</sup> m<sup>2</sup>/s), longitudinal dispersivity (10 m along the plume trajectory), and transverse dispersivity (5 m)”. The source of this information is not provided in Appendix 7-C. It is unclear if the values used are defaults in the modelling software, from literature, from small-scale laboratory tests, or are site-specific values determined through tracer tests.</p> <p><b>Rationale:</b> The use of a calibrated flow model does not imply that the solute transport model is calibrated. The transport parameters (such as effective porosity, dispersivity and reactive transport parameters) can only be calibrated by matching simulated and observed spatial and/or temporal distributions of a solute. Sensitivity analysis indicates that decreasing longitudinal and transverse dispersivities by a factor of two resulted in exceedances of groundwater criteria for both selenium (Se) and cobalt (Co). Given the clear influence of these values on contaminant transport, it is important that transfer parameter values are justified in the solute transport model. In addition, the influence of large-scale heterogeneity on dispersion and solute transport predictions should be discussed, to identify any uncertainty in the model predictions, and provide confidence that the applied model is adequately representing groundwater flow and solute transport.</p> <p>Further guidance on solute transport modelling can be found in BC MOE (2012) [1].</p> <p><b>Reference:</b> [1] British Columbia Ministry of the Environment (BC MOE). 2012. Guidelines for Groundwater Modelling to Assess Impacts of Proposed Natural Resource Development Activities. Report no. 194001, 385 p.</p>	<p>1. Please provide the source of the numerical value used for diffusion and longitudinal and transverse dispersivity, and provide justification if default values by the model code were used.</p> <p>2. Please provide a discussion on the influence of large-scale heterogeneity on dispersion and solute transport predictions in the modelling report.</p> <p>See also related: IR-89.</p>	<p><i>This IR has been accepted for the purposes of the current EA process, and the outstanding issues below will be further assessed as part of licensing technical reviews, prior to the granting of a Licence.</i></p> <p>CNSC staff appreciate the comprehensive information provided relating to longitudinal dispersivity and variation based on scale. However, it should be noted that guidance from Gelhar et al. (1992) and the BC MOE (2012) indicate that horizontal transverse dispersivity values should be approximately 1 order of magnitude lower than longitudinal dispersivity values, and vertical transverse dispersivity values should be approximately 2 orders of magnitude lower than longitudinal dispersivity. For the model presented in the EIS, transverse dispersivity is represented by a singular value of 5 meters, with the supporting rationale that the Gelhar et al. (1992) identified 5 meters as a representative value. It is important to note that the Gelhar et al. (1992) paper considered 5 meters to be representative for horizontal transverse dispersivity and identified that vertical transverse dispersivity is smaller than horizontal transverse dispersivity. Additionally, it is important to note that Petrotek (2021) used a transverse dispersivity of 1 m in their numerical models of the ore zone aquifer. CNSC staff thus request that Denison provide further information relating to why horizontal and vertical transverse dispersivity are represented using a singular value, and how this value is considered appropriate to represent both dimensions.</p> <p><b>Reference:</b> Petrotek 2021. Groundwater Model Report Phase 1, Phoenix Deposit Wheeler River Project. Prepared for Denison Mines. December 2021.</p>	Accepted	n/a

IR-97	-	ECCC	Fish and fish habitat	Appendix 7-C, Figures 4-6, 4-7a, 4-7b, 4-8a, 4-8b, 4-9a, 4-9b	<p><b>Context:</b> Appendix 7, Figures 4-6, 4-7a, 4-7b, 4-8a, 4-8b, 4-9a, 4-9b present contaminant transport simulations of chloride, selenium, cadmium, and uranium. All simulations use initial condition concentrations at t=0 (or end of mining operations. In the 3D FEFLOW contaminant transport model it is not clear why initial condition concentrations were chosen rather than a constant concentration boundary.</p> <p>It is also unclear if mining activities will cause mobilization of the contaminants beyond the end of operations.</p> <p><b>Rationale:</b> The choice of boundary conditions may impact the predicted transport of contaminants that reach Whitefish Lake through groundwater, which may have impacts to aquatic life.</p>	<ol style="list-style-type: none"><li>1. Explain and clarify if mining operations will mobilize contaminants beyond operations?</li><li>2. Clarify if the source of contamination, (e.g., uranium, selenium) will cease after operations?</li><li>3. For the 3D model please provide the rationale for using initial concentrations rather than constant concentration boundary conditions for contaminant concentrations.</li></ol>	<p><i>This IR has been accepted for the purposes of the current EA process, and the outstanding issues below will be further assessed as part of licensing technical reviews, if required.</i></p> <p>It should be noted that the fate and transport simulations of the COCs are dependent on groundwater flow. Therefore, the Proponent’s conclusions on the transport of COCs, may need to be revisited depending on how IR-89 is resolved.</p>	Accepted	n/a
IR-98	-	CNSC	Change to an environmental component due to hazardous contaminants	Section 8, Aquatic Environment	<p><b>Context:</b> It states in EIS in Section 8.3.7.1 (p. 8-151) that "Cameco’s Key Lake Operation will overlap spatially and temporally with the Project".</p> <p><b>Rationale:</b> It is not clear whether there is the possibility that planned Denison discharges would eventually flow into and influence a background reference lake used by Key Lake operation.</p>	Please provide supporting information to demonstrate whether discharges from the proposed operation will not eventually flow into a reference lake used by another existing operation.		Accepted	n/a
IR-99	-	CNSC	Aquatic environment	Section 8, Water Quality, Table 8.2-13	<p><b>Context:</b> Table 8.2-13 shows the maximum concentration of hazardous and radiological COPC’s in surface water throughout the local study area. However, the concentration for all constituents is stated as mg/L.</p> <p><b>Rationale:</b> It is unusual for radiological COPC’s to be displayed in mg/L, radiological constituents are typically displayed in Bq/L</p>	Please use Bq/L when displaying concentration of radiological COPC’s. If this was a typographical error in the table, please indicate as such and revise the table to indicate values are indeed in Bq/L. Please also review other tables displaying concentrations of radiological constituents to ensure this error is not repeated in other tables.		Accepted	n/a
IR-100	-	HC	Indigenous Peoples' health / Socio- economic conditions	Section 8, (p. 8-195)  Section 8.5.3, Table 8.5-2, (p. 8-226)	<p>Mercury is excluded as a COPC in the assessment. Inadequate consideration of mercury and methylmercury in fish and other country foods, and use of incorrect Hg-related health guideline values can underestimate the risks to human health among country food consumers.</p> <p><b>Context:</b> Section 8 states “Mercury has not been identified as a COPC for the Project as it is currently not present in the receiving environment (i.e., background condition) at detectable concentrations and will not be produced as part of the mine process; therefore, it will not be discharged to the aquatic environment.</p> <p>However, it is understood that potential nutrient enrichment-related effects are possible and can be linked to increases in mercury in the environment” (p. 8-195).</p> <p>Table 8.5-2 shows that there is mercury present in the tissues of Northern Pike and White Sucker sampled in the waterbodies within the local study area and in Russell Lake. These fish are regularly consumed by nearby communities according to the ERFN 2017 dietary survey.</p> <p>In Section 8.5.3, fish tissue concentrations are</p>	<ol style="list-style-type: none"><li>1. Include mercury (including methylmercury) as a COPC in the assessment given the baseline presence of mercury in sampled fish, the potential increase of methylmercury in receiving waters due to nutrient enrichment resulting from the Project, the significant fish consumption by the local population and that country foods, particularly fish, are an important source of dietary exposure to mercury.</li><li>2. Assess health risks from fish consumption by calculating hazard quotients for baseline and predicted methylmercury levels in country foods using Health Canada’s pTDI for methylmercury (<a href="#">Health Canada, 2007</a>).</li><li>3. Clarify whether mercury data represented throughout the EIS represents total mercury, inorganic mercury or methylmercury.</li></ol> <p><b>Suggestions for mitigation and follow-up measures:</b> Health Canada recommends including methylmercury in the list of COPCs to be monitored in fish throughout all project phases.</p>	<p>The July 2<sup>nd</sup>, 2024 supplementary submission for IR-100 and version 2 of the Commitment Register (July 17<sup>th</sup>) included a commitment to assess health risks from fish consumption by comparing fish tissue data collected during operation from the monitoring program against Health Canada's mercury guideline of 0.5 ug/g wet weight, as applicable (ID 8-44). Reviewers note an apparent contradiction between use of the provisional tolerable daily intake (pTDI) and the commercial guideline for mercury in fish.</p> <p>The Proponent states that the health risks from fish consumption will be assessed by comparing mercury concentrations from monitoring activities to the Health Canada maximum level for mercury in retail fish. As noted in HC’s review of the Round 2 Response, the mercury guideline for commercial fish (0.5 ppm) may not be protective of human health because fish consumption patterns of local Indigenous populations may differ from that of the general Canadian population who generally obtain fish from retail sources.</p> <p>The health risks of mercury exposure should be assessed using local fish consumption rates and the provisional tolerable daily intake (pTDI) value of 0.2 µg/kg bw per day. Denison are expected to remove reference to the use of</p>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>compared to Health Canada’s human health risk- based maximum permissible mercury concentration (0.5 µg/g wet weight), which is applicable to most species of commercially sold fish rather than country foods.</p> <p><b>Rationale:</b> It is recommended that mercury be listed as a COPC considering it is in fact present in fish tissue under existing conditions, the significant consumption of fish by the local Indigenous communities, and its toxicological significance to human health.</p> <p>Further, the Health Canada provisional tolerable daily intake (pTDI) value of 0.2 µg/kg/bw/day (<a href="#">Health Canada, 2007</a>) is a more appropriate reference level when evaluating consumption of mercury in fish by Indigenous people, as it allows for the consideration of food consumption patterns in the risk assessment that differ from the general population and is protective of the most sensitive sub-group (i.e., developing foetus).</p> <p>It is important to note that methylmercury, rather than inorganic mercury, is generally the predominant mercury species present in fish and is also the most toxicologically significant form. The assumption of 100% of mercury in fish and other country food items being present as methylmercury ensures that the potential health risks are not underestimated. It is unclear, however, if the mercury data presented throughout the EIS represent total mercury, inorganic mercury or methylmercury.</p>	See also related Advice to the Proponent: AD-31.	<p>commercial guideline for mercury in fish to remove apparent contradiction with provisional tolerable daily intake in the final EIS submission package, and this IR can be resolved for the purposes of the EA process.</p> <p><i>The following outstanding issue will be further assessed as part of licensing technical reviews, prior to the granting of a licence:</i></p> <ul style="list-style-type: none"><li>Local fish consumption rates should be discussed and refined as needed during planned engagement with Indigenous Nations and communities.</li></ul>		
IR-101	-	ECCC  CNSC	Fish and fish habitat	Section 8.1.1.3, Section 8.2.1.3 Aquatic Environment	<p><b>Context:</b> In Section 8.1.1.3 Spatial and Temporal Boundaries the Project Area, Local Study Area (LSA) and Regional Study Area (RSA) are established as they pertain to surface water quantity. The same is done in Section 8.2.1.3 for surface water quality. In Section 8.1.1.3 Figure 8.1-4, the locations of the Project Area, LSA, RSA and surface water features and monitoring stations are provided.</p> <p>However, the locations of wetlands located near the Project area and within the LSA and RSA have not been provided. The location of wetlands within or near the Project footprint, as well as the other wetlands existing within the LSA can be confirmed from Part II_S9 Terrestrial Environment, Section 9.2.3.3 Figure 9.2.-8, including the wetland classifications. There appears to be at least one shallow open water wetland and several bogs located within the Project Area. There is no consideration of wetlands or potential effects to wetland hydrology, surface water or sediment quality throughout the aquatic environment assessments. There is no baseline information regarding wetlands and their status as fish habitat and ecological function, or assessment of potential effects to flow rates, water levels, water quality, sediment quality, or biota.</p> <p><b>Rationale:</b> There is currently not enough information provided for ECCC to provide advice on the potential risks of the proposed Project to wetland hydrology, surface water and sediment quality within the LSA. This pathway of effects is important to assess in terms of potential effects to wetland habitat availability and quality due to changes in flow rates, water levels, water quality, sediment transport, sediment</p>	<p>1. Provide baseline information regarding wetland characterization within the Project Area and LSA, including: locations, wetland type, size, water surface elevation, depth, water flow pathways, and the presence of wildlife receptors including presence of fish/fish habitat within the Aquatic Environment section of the draft EIS. If this information is available in annexes or baseline studies, summarize it within the main body of the Aquatic Environment section of the draft EIS with references to respective documents for review.</p> <p>2. Provide baseline information on wetland surface water and sediment quality characterization for wetlands within the Project footprint.</p> <p>3. Provide an assessment of potential effects to wetlands within the LSA and potential effects to ecological receptors during all phases of the proposed Project.</p> <p>4. Provide further information on mitigation measures and monitoring that would be applied for the protection of wetlands.</p>	<p>Denison has not adequately responded to the request to identify potential effects to sediment quality to support identification of project-related effect pathways to wetlands, in either the February 10<sup>th</sup>, 2024 responses to IRs or the July 2<sup>nd</sup>, 2024 supplemental submission. The K<sub>d</sub> values could differ significantly in wetland environments compared to in lake/stream measurements where all samples were taken and there are discrepancies in wetland classification within the EIS and information provided in IRs with the actual classification standards for various wetland types.</p> <p>For further explanation, the descriptions of the wetland areas provided in the February 10<sup>th</sup> response do not correspond to the information provided in the supplemental round of responses received from Denison. For example, Figure 2 of Appendix 8-F: Wetland Effects Assessment Report identifies a black spruce treed bog (ecotype BS17) between Whitefish Lake North and Whitefish Lake Middle (La-5), where effluent will be discharged. According to the Canadian Wetland Classification System (Warner &amp; Rubec, 1997), bogs are defined as receiving water only from precipitation, with no hydrological connections to groundwater or littoral areas. This does not match with the response of “<i>littoral areas and these wetland portions are not cut-off from or isolated from the main basin of the lake.</i>” The response also does not correspond to the BS17 ecotype described in Appendix 9-B: Terrestrial Environment Wildlife and Vegetation Baseline Inventory.</p>	Not Accepted	<p><b>Note: For the complete history of the FIRT’s comments and Denison’s responses to this IR, refer to Appendix A below. Any attachments and updated EIS sections associated with the IR response in this table are available in Appendix A.</b></p> <p>Denison reaffirms the approach taken with baseline sediment data as utilized in the EIS and more specifically in the ERA (e.g., pooled sediment data from locations in an unimpacted system in the same watershed where land use and type is homogeneous) as an appropriate and acceptable basis to define</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					quality and potential effects to terrestrial and aquatic receptors. It is necessary to evaluate if changes in groundwater and surface water runoff flows and routing will affect water levels and habitat availability within wetlands. Potential effects from COPCs and radionuclides to surface water and sediment, or potential effects to ecological receptors within wetlands have not been evaluated.		<p>The uncertainty introduced as to the conditions on site complicates the discussions on baseline conditions and potential impacts in wetlands which the Proponent assumes to provide fish habitats. Bogs and fens (ecotypes BS17, BS18, BS19, BS21) are identified in and around Whitefish Lake and these wetlands will have different water and sediment chemistry than lakes and creeks. For example, the partitioning coefficients of sediments in a fen would not be expected to be the same as those in a lake, though both may be depositional environments, sediments in the fen would be richer in organic matter because of the vegetation present. Organic matter in sediment is an important factor affecting soil-water partitioning coefficients. Because of this, the sediment in wetlands is likely to adsorb more metals than sediment found in lakes. For this reason, it is important to understand baseline conditions and model impacts in order to ensure the aquatic environment will not be impacted by the project’s planned discharges.</p> <p>The Proponent should clarify if the wetlands were misidentified in the Terrestrial Environment Wildlife and Vegetation Baseline Inventory. If they have been misidentified, then corrections should be made to the Baseline Inventory and Wetlands Assessment Report, and information provided in the Proponent’s round 3 response should be integrated in Section 8.3 of the EIS. If they have not been misidentified, then the Proponent should respond to round 3 information requests considering the wetland environment.</p> <p><u>In order to resolve this IR, Denison are expected to:</u></p> <ol style="list-style-type: none"><li>1. Update wetland classification in the LSA according to the Canadian Wetland Classification System (Warner &amp; Rubec, 1997). Focus should be applied to updating areas with hydrological connections to groundwater and littoral sources, which may have been misclassified as bogs. This should include any sub-classification of wetlands currently categorized as Shallow Open Water in Appendix 8-F: Wetland Effects Assessment Report. Updates should be made as necessary to all relevant reports, including the Terrestrial Environment Wildlife and Vegetation Baseline Inventory as needed.</li><li>2. Update habitat mapping for wetlands to reflect any changes in wetland classifications, particularly for wetlands that may include fish and fish habitat.</li><li>3. Update Table 8.3-3 and 8.3-4 in Section 8 of the EIS to include more specific information on wetlands that may contain fish and fish habitat, such as information on wetland type &amp; extent, vegetation, substrate type, organic matter content, etc.</li><li>4. Provide a table with summary statistics (grain size analysis and sediment quality) from sediment sampling specific to each individual sampled lake or stream, rather than summary statistics for all waterbodies and watercourses pooled together.</li><li>5. Provide the source reference for the K<sub>d</sub> values used for the ERA in Table 3-6 and the specific characteristics of sediments (i.e. grain size and composition) of the regional study areas as they compare to LA-5, the LSA and the RSA.</li></ol>		<p>existing conditions (and the variability thereof) and to identify potential Project effects to sediment and evaluate the significance of these effects. The IMPACT model predicts how constituents travel through the environment and concentrations of constituents change as a result of interactions with natural flows and lake sediments. The K<sub>d</sub>s applied in the model have largely over predicted the baseline sediment concentrations throughout the lakes demonstrating that the model and model inputs are conservative, and impacts (i.e., incremental changes in constituent concentrations resulting from Project emissions to the aquatic environment) have not been under predicted.</p> <p>For context on a sensitivity analysis for sediment quality predictions, refer to Appendix 10-A, Section 6.2.2 Effluent Discharge Rate. A sensitivity analysis of key model parameters was undertaken to understand the degree to which the results or conclusions of the risk assessment would vary if parameters differed from what was assumed. In this section, sediment</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
							<p>6. Conduct a statistical analysis with a power analysis comparing sediment characteristics (grain size analysis and sediment quality) from the various sub-samples taken within each waterbody to conclude if there are any significant differences between sub-sampling stations, and determine if there is within-lake variation in sediments. Denison should provide the methodology they will use to conduct the statistical analysis and power analysis for CNSC review and acceptance prior to completing the analysis. Based on the results of this statistical analysis, Denison should:</p> <ul style="list-style-type: none"><li>a. If the results determine that there is enough statistical power to confirm there is no within-lake variation in sediment characteristics within LA-5, Denison should then complete a statistical analysis and power analysis comparing LA-5 to other sampled areas to determine if there is any between-lake variation in sediment characteristics.</li><li>b. If the results determine that there is not enough statistical power, or that there is enough statistical power but there is significant within-lake variation between sub-samples in LA-5, Denison will require the additional baseline data that Denison has already committed to collecting, to update the modelling during the EA phase to support conclusions on significance of effects to the receiving environment.</li></ul> <p>This IR relates closely to IR-107 that demonstrates that there is not enough baseline data to support conclusions on significance of effects.</p>		<p>predictions are shown for a scenario where effluent is released at the maximum upper bound rate of 81 m<sup>3</sup>/hr and the maximum concentrations of COPCs in the receiving environment increases up to 120%. It is also a conservative prediction in that it assumes effluent is released during decommissioning at the same upper bound flow and quality as during operations. In this sensitivity analysis, the modelled concentrations of all COPCs are expected to be below their corresponding sediment quality guidelines, with the exception of cadmium, molybdenum, selenium and vanadium; however, the predicted exceedances for cadmium, molybdenum, selenium and vanadium are all below their probably effect level (PEL), no-effect (NE2), or severe effect level (SEL) values, therefore, adverse effects to benthic communities are not anticipated under the upper bound discharge scenarios.</p> <p>Importantly, monitoring programs will be implemented to assess the environmental performance of the Project relative to the predictive assessment that has been completed in</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									support of the EA process. Such monitoring is needed since there is always some level of uncertainty associated with EA predictions (and it is noted that uncertainty analysis has been completed as part of the EIS and considered within the context of assessing the significance of effects). Specific to this IR, sediment sampling will be completed to verify the accuracy of predicted effects and the effectiveness of proposed mitigation measures. Monitoring and follow-up programs will be integrated within Denison’s overall Environmental Management System (EMS) framework and implemented through the various programs, plans and procedures that would be developed therein. Denison is committed to achieving continual improvement in environmental performance through its EMS. As part of this overall commitment to continual improvement, monitoring programs will be implemented via an adaptive management approach. Adaptive management is a systematic process for continuously improving environmental management practices by learning from their

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									outcomes. It provides the flexibility to address/accommodate new circumstances, to adjust monitoring, to identify and implement new mitigation measures, or to modify existing measures throughout all Project phases. Further, it provides a means to confirm that the monitoring elements remain valid, meet regulatory requirements, and be responsive to evolving objectives. At the EIS stage, the conceptual plan is for sediment sampling at Whitefish Lake South (near-field), at an upstream reference location (Whitefish Lake North), and at downstream locations (far-field) every three years. The far-field monitoring locations will be located in Whitefish Lake South prior to its discharge to McGowan Lake. The details of the sediment monitoring program will be refined as the Project advances. Sediment constituent concentrations will be compared to the values used in the EIS and to applicable regulatory criteria or objectives. As noted, above sampling effort will be predetermined that meet the rigor required of federal / provincial

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									<p>requirements as described in relevant technical guidance documentation for operational monitoring.</p> <p>In general, applying equally to sediment quality as with all other environmental aspects that have been considered in the EIS, where an environmental monitoring program identifies predicted effects are greater than anticipated, Denison would evaluate whether these effects could result in changes to the conclusions in this EIS. If changes are confirmed, then Denison would evaluate the need for revised mitigation actions and management practices to manage effects. As highlighted above, Denison’s interpretation of monitoring data would include reference to environmental performance criteria. An exceedance of environmental performance criteria would trigger Denison to respond to further investigate the potential issue. Based on this investigation, where need for revised mitigations is identified these measures would be developed and implemented. It is expected that the adaptive management process would be informed by input sought</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									<p>from Indigenous people, stakeholders, and regulatory agencies. The following section provides a response to each to the specific IR questions:</p> <p>1. The project’s ecosite classification is outlined in Section 9. Ecosite classification was completed using the Guide to the Ecosites of Saskatchewan’s Provincial Forests (McLaughlin et al. 2010) Ecosite information was transferred directly into Appendix 8-F which originated in January 2024 during the EIS review process in response to FIRT IRs.</p> <p>Refer to Section 9 for the wetland assessment and Appendix 9-B for the terrestrial baseline report with information on ecosite mapping in Section 2.1.3 and ecosite characterization methods and results in Section 2.2. The measurable parameter for the wetlands assessment in Section 9 was change in areal extent of wetlands; this was also considered in Appendix 8-F.</p> <p>The EIS guidelines do not require use of the suggested classification scheme (Canadian Wetland Classification System</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									<p>(Warner &amp; Rubec, 1997). Denison used information from the province’s land classification system and have fulfilled that EIS requirement.</p> <p>Effectively, to be conservative in one assessment (assessing change in areal extent of wetlands in Section 9) we have introduced questions and confusion in Appendix 8-F. The data was fit for purpose for Section 9 and to be consistent, it was carried over into Appendix 8-F without any adjustments or reclassifications.</p> <p>This IR is not questioning the assessment of changes in areal extent of wetlands, but the purported under estimation of risk through the effluent modelling. As such, no updates to the wetland classifications are warranted at this time. Further, Denison has committed to completing additional wetland studies (see response to point 2).</p> <p>2. Additional wetland surveys will be completed after the EA stage, per commitment 8-46 in Denison’s commitment register (i.e., “To further supplement existing information that exists for</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									<p>the LSA wetlands, Denison is committed to undertaking wetland surveys including the collection of water quality, sediment quality, benthic invertebrates and fish and fish habitat surveys prior to the construction to provide an updated baseline for assessing the success of mitigation measures and to assess potential effects of the project on wetlands. These locations will then be further considered as part of the EMP for continued monitoring for these media and biota.”).</p> <p>Appendix 8-F has been updated and specifically, a new appendix (Appendix A) has been added. This new appendix provides photos and text to orient the reviewer to the in-lake wetlands of interest. While some of these in-lake areas were conservatively classified as wetlands in the terrestrial assessment (EIS Section 9), from an aquatic perspective, these in-lake wetlands of interest are littoral / nearshore zones in the lake and connecting channels.</p> <p>The balance of this IR response outlines the rationale for why the CNSC’s suggested wetland mapping updates to the EIS</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									<p>would not change any EIS conclusions and are not required at this stage for EA determination.</p> <p>3.Any wetlands that were present within water bodies, were mapped as part of the baseline program and results would be incorporated into the existing fish habitat summaries provided in Tables 8.3-3 and Table 8.3-4. Refer to Section 8.3.3 for the existing environment methods and results. It is noted in the EIS that detailed information regarding fish and fish habitat baseline data collection and analyses are provided in Appendix 8-D, Appendix 8-B, and additional information pertaining to wetlands is provided in Appendix 8-F.</p> <p>4. Sediment grain size results for McGowan Lake, Whitefish Lake south, Whitefish Lake north and Russell Lake are summarized in EIS Section 8 Table 8.4-2, and sediment chemical composition results are summarized in Table 8.4-3.</p> <p>The baseline sediment grain size and chemistry analysis for all stations within the baseline study area are</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									<p>provided in Appendix 8-D Aquatic Baseline, Tables A-3 and A-4 of Appendix A, respectively.</p> <p>5. A summary of the source reference for the Kds is provided in Attachment IR-101 (Round 4), and a discussion on sediment grain size for the Wheeler River and regional study area is also provided.</p> <p>6. Based on discussions between the CNSC and Denison in September 2024, the primary request from the CNSC was related to additional information on the IMPACT Kds, which has been provided as part 5 of this response. The requested power and additional statistical analyses can be completed as part of licensing and will include results from pre-operational sediment sampling. Any pre-operational sediment sampling results will be included in the environmental risk assessment (ERA) update to support Denison’s application for a licence to operate. Additionally, the pre-operational sediment sample results in combination with existing data will be the basis of future comparisons of</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									measured data from effluent exposed and reference areas. Such comparisons would be based on statistically based study designs that meet the rigor required of federal / provincial requirements as described in relevant technical guidance documentation for operational monitoring.
IR-102	-	ECCC  CNSC	Fish and fish habitat	Section 8.1.3.1  Appendix 8-C, including Appendix II, Table 1 (p. 2)	<b>Context:</b> Only one measured-results dataset for baseline stream flow exists that is relevant to the Project data from the Water Survey of Canada (WSC) station for Wheeler River (06DA005), and the Proponent used constructed records. The Proponent states that data from 06DA005 was used to extend local hydrometric station records and calculate baseline water quantity metrics. However, this was done through a complex combination of daily data correlation or monthly unit area runoff relationship, with or without offset, where some stations were based off constructed records instead of the real long-term dataset at 06DA005 (see Section 8.1.3.1 and Appendix II of Appendix 8-C, Table 1, p.2 (PDF p. 569)). Appendix 8-C references previous reports in its own appendices, but no equations are shown and there is no description of the accuracy of the fit, or explanation for not referring back to the one dataset (WSC station). Subsequent statistics calculated from these constructed records (e.g., 7Q10 needed for SK water Licenses) would be affected by this uncertainty.  <b>Rationale:</b> Fish habitat can be altered by changes to depositional and erosional patterns in streams. Confidence in the Proponent’s estimate of baseline water quantity, and by extension Project effects to fish habitat, cannot be established without a complete description of the method applied, as well as a discussion of its accuracy.	1. Provide more information on the extension of Project hydrometric station data using WSC station 06DA005.  2. Discuss the accuracy of any correlations/relationships and justify any deviations from simple unit area runoff relationships in the estimation of baseline water quantity values for the Project hydrometric stations. Constructing records from records that are themselves constructed is not recommended.  3. If baseline water quantity metrics need to be revised, discuss (if any) resulting changes to the effects assessment.		Accepted	n/a
IR-103	-	ECCC  CNSC	Fish and fish habitat	Section 8.1.3.4 Climate Change Influenced Extreme Events	<b>Context:</b> The Proponent notes that Intensity duration frequency (IDF) curves are used to estimate the size of water management structures around a site and that the IDF curves are often specific to climate monitoring stations.  The Proponent used the IDF_CC Tool 5.0 developed by the Institute for Catastrophic Loss Reduction (2021) which generates Intensity Duration Frequency (IDF) curves at ungauged locations in order to estimate future IDF curve values under influences of climate change. This tool generates sub-daily values at ungauged locations by interpolation and distance weighing from gauged locations.  <b>Rationale:</b> IDF trends exhibit random behavior at some locations and correlated behavior at other locations. The choice of gauged locations will infer the statistics	Provide the gauged stations used to generate the sub daily duration values found in Table 8.1-6: Baseline of Intensity Duration Frequency data.	As Denison has added a commitment related to updating the IDF (1 in 100 year 24-hour rainfall) and demonstrate climate change resilience of the project (conduct climate risk and resilience assessment) in version 2 the Commitments Register (ID 8-50), this IR has been accepted for the purposes of the current EA process.  <i>The following outstanding issues will be further assessed as part of licensing technical reviews, prior to the granting of a licence.</i>  If future projections of IDF are going to be used in design, then the Proponent is advised to consult the CSA (2019) guidance and provide revised estimates of their potential changes over the project’s duration.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					for the ungauged locations, including the IDF trends. Without identification of the gauged locations, it is not possible to assess if the modelled data is realistic or not. If the modelled data is not accurate the design of water management structures on the site may not be sufficient resulting in the potential for impacts to the Project from flooding or extreme weather events.		<p>The Proponent should perform a statistical analysis of precipitation using historical data at the location of interest including, confidence intervals to consider uncertainty using the approach outlined in CSA (2019). Additionally, ECCC calculated that the IDF value for a 24h 100-year event is 91.2 mm at 95% confidence interval (using 10 years (2011-2021) of historical precipitation data at Key Lake). However, the same IDF value for a 24h 100-year event was presented as an average value of 67.2 mm with no confidence interval in the IR-103 Attachment. The Proponent value is neither representative nor conservative and the proponent should update the current value based on a new statistical analysis that considers uncertainty and longer record of historical precipitation.</p> <p>See also AD-72 in the Advice to Proponent table.</p>		
IR-104	-	ECCC	Fish and fish habitat	<p>Section 8.1.3.4.2 Probable Maximum Precipitation (PMP) Events</p> <p>Appendix 8C</p>	<p><b>Context and Rationale:</b> The Proponent notes: “The probable maximum precipitation (PMP) event is a design standard value for an extreme rainfall event. The PMP event does not have an estimated return period but is instead based on the theoretical maximum amount of water that a storm could produce based on the maximum persisting dew point.”</p> <p>The Proponent provides a PMP value of 489.3 mm, which is based on data and methodologies available in 1999, taken from the <a href="#">Atmospheric Environment Branch Report (1999), Report Number AHSD-R99-01</a>. The Proponent references Appendix 8C for details. Appendix 8C contains no supplementary information other than what is already provided in Section 8.1.3.4.2.</p> <p>The assumptions and methodologies presented in the report are the results of time series analyses available in 1999. As time series evolve so do the derived statistics. In order to assess potential flood risks and impacts to the Project from flooding, data that is current and representative of the changing climate is needed. The Proponent should explain why they’ve used data from 1999 rather than using up to date data, describe what alternative methods for determining PMP they have considered, and describe how they will support their use of 489.3 mm as a PMP, or describe how they will generate a refreshed PMP. The main factor that influences the statistical data output is the length of the time series hence the reason to keep the statistical data. The PMP values can be substantially (&gt;10%) different if two decades of data is used in the statistical analysis.</p>	<p>1. Provide a revised PMP value (using up to date data) or justify the use of a PMP that is based on data and methodologies from 1999 as opposed to a more recent time series analysis.</p> <p>2. Describe the alternative methods for determining PMP values that were considered. Include descriptions of both “statistical” outcomes and “rational” outcomes as applicable.</p> <p><b>Technical Discussion Required:</b> Yes</p>	<p>Response to IR-104 is accepted by CNSC staff based solely on the Denison’s response (E-DOC#-7220826, p.47/112) that states:</p> <p>“Despite Denison’s reiteration that the PMP is adequate for the EA level design basis, Denison is committed to revisiting the estimates per CNSC’s recommendations, as applicable, for the licensing phase of the Project.”</p> <p><i>This IR has been accepted for the purposes of the current EA process, and the outstanding issues below will be further assessed as part of licensing technical reviews, prior to the granting of a Licence.</i></p> <p>There are an additional 24 years of meteorological datasets since the 1999 study thus all historical rainfall extremes including those since 1999 study should be considered to estimate up to date PMP at the Project site The proponent’s justification on whether the 1999 or 1994 PMP estimates are current and conservative should be substantiated based on meteorological data analysis. An estimation of updated PMP is achievable by the proponent as meteorological data is freely available and accessible from ECCC and the proponent should provide a revised PMP.</p> <p>The Proponent should also clarify how recent the data used to calculate the PMP or the time series is and explain the use of an older data set that will not produce as accurate of a PMP value as a more recent data set would produce, even when estimates are conservative.</p> <p>Specifically, a. Explain the rationale for the use of the data set which was used to derive the PMP. B. Clarify if the PMP and/or the time series was calculated using more recent data.</p> <p>This will allow for an accurate evaluation of the validity of results derived from the data sets selected by the Proponent.</p>	Accepted	n/a
IR-105	-	Directorate of Fisheries	Fish and fish habitat	Section 8.1.4.1, Potential	<b>Context:</b> Table 8.1-8 and Table 8.3-6 in the EIS indicates a potential for freeze wall operation to influence groundwater interactions and surface water quantity and as	1. Provide a more fulsome analysis of the potential impact of freeze wall operations on local and semi-regional groundwater		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
		and Oceans (DFO)		interactions between project and valued component/key indicators Surface Water Quantity  Section 8.1.4.2.2, Surface Water Taking  8.3.4.1, Potential interactions between project and valued component/key indicators	a result, impact fish and fish habitat. Section 8.1.4.2.2 references Section 7 Geology and Groundwater for details on potential impacts. In addition, IR-63 notes the groundwater model does not describe the pathway in which groundwater would pass around the freeze wall during operation and any resulting potential effects on groundwater discharge to Whitefish Lake.  <b>Rationale:</b> As per IR-63, the groundwater model analysis is insufficient to make conclusions on the potential effects of the freeze wall on groundwater discharge into Whitefish Lake. DFO requires this information to fully understand if altered groundwater regimes will result in changes to Whitefish Lake water levels and any potential impacts to fish and fish habitat as a result of changing water levels.	regimes, and subsequently to fish and fish habitat within Whitefish Lake. The analysis should provide a rationale of how the scope of the groundwater model is relevant to and able to detect changes at the scale of fish and fish habitat.  2. If impacts to fish and fish habitat in Whitefish Lake are predicted to occur due to changes in the groundwater regime, describe any mitigation measures that could be used to avoid these impacts.  3. If impacts are predicted that cannot be avoided, characterize residual effects on fish and fish habitat.			
IR-106	-	CNSC	Change to an environmental component due to hazardous contaminants	Section 8.1.4.2.3, Surface Water Discharge	<b>Context:</b> It is stated in this section under construction that all site contact water will be held in the Clean Waste Rock Pond.  <b>Rationale:</b> It is unclear from this section what will happen to the contact water held in the Clean Waste Rock Pond, and whether it will be removed from site or released at a later time. What is the contingency plan if more contact water is produced during construction than the Clean Waste Rock Pond has capacity for.	Please indicate what will happen to the contact water stored in the Clean Waste Rock Pond during construction activities, will it be released after the wastewater treatment plant is installed? Further, please describe the contingency plan if contact water produced exceeds estimates and will exceed the volume of the clean waste rock pond?		Accepted	n/a
IR-107	-	CNSC ECCC	Aquatic environment	Section 8.2.3.3, Existing Surface Water Quality	<b>Context:</b> Under the methodology and metrics section (8.2.3.1) it is stated baseline water quality was sampled in 2016, 2018, and 2019. Looking at the data in Appendix A of Appendix 8D it seems that some waterbodies have little data available for baseline characterization. For example, Whitefish Lake only has 3 and 5 samples taken between its two sample stations, with sampling frequency seeming intermittent.  <b>Rationale:</b> The amount of data available for baseline water quality characterization does not seem sufficient to adequately characterize the baseline and the variation it would experience. An effective baseline characterization is vital to ensure water quality is indeed not being affected by the Project. In addition, it is not clear if data quality objectives were applied to determine baseline information was adequate.  To meet CEAA 2012 requirements, and CNSC expectations outlined in REGDOC 2.9.1, Environmental Principles Assessments and Protection Measures, the applicant is required to complete a characterization of the baseline environment.  As described in REGDOC 2.9.1 Appendix B.2, Characterization of the Baseline Environment for Environmental Assessment Under CEAA 2012, the “baseline information should be sufficient to support the use of an aquatic dispersion model to conduct the site-specific ERA and to support an assessment of the effects of the environment on the facility or activity”	Please clarify which data quality objectives were used for the baseline characterization data. Please provide justification whether the number of datapoints collected with inconsistent frequency in baseline surface water characterization is sufficient to meet data quality objectives and to adequately characterize the baseline, and whether Denison is confident that the data collected is enough for a robust water quality baseline characterization.  <b>Suggestions for mitigation and follow-up measures:</b> CNSC recommends that additional water samples are collected and analyzed at a consistent frequency to ensure a robust baseline	A path to resolution is still under discussion for this IR. Further guidance to Denison is forthcoming, and this table will be amended and posted to the Canadian Impact Assessment Registry, once provided.		<b>Note: For the complete history of the FIRT’s comments and Denison’s responses to this IR, refer to Appendix A below. Any attachments associated with the IR response in this table are available in Appendix A.</b>  <b>Denison recognizes this IR is under discussion and have provided the following response IR-107 received in September 2024.</b>  <i>Note: Denison and the CNSC had a number of meetings and discussions on this Round 4 IR between Sept. 16, 2024 and October 9, 2024. The response provided here is focused on the</i>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					In addition, the “applicant or Licensee should include an assessment of any limitations or gaps in the quality and extent of baseline data and methods, as well as the method(s) by which they have been addressed.”				<p><i>central questions coming out of these discussions.</i></p> <p>Routine surface water quality sampling has started at the Wheeler River Project site. Denison made the commitment to collect additional pre-operational surface water quality data in commitment 8-48 and this work has been initiated. The list of surface water quality sampling stations, sample frequency, and analyte list is included in Attachment IR-107 (Round 4).</p> <p>For the CNSC’s consideration, a comparison of June, July, August, and September 2024 water samples collected at Whitefish Lake (LA-5) is provided in Attachment IR-107 (Round 4). As shown in the table, the results collected in 2024 are within the range (minimum to maximum) of pooled results for both the full LSA dataset and key assessed lakes. The majority of minor differences between recently collected samples and pooled datasets are related to differences in analytical detection limits. We note that a low-level trace metal analysis was used in 2024 and this resulted in lower detection limits for some parameters compared to previous results.</p> <p>We note that pooling of data to establish a background is not an uncommon approach. For example, such an approach is contemplated by Guidance</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									<p>on the Site-Specific Application of Water Quality Guidelines in Canada: Procedures for Deriving Numerical Water Quality Objectives (CCME 2003). This procedure acknowledges the use of “regional” data to derive background concentrations assuming the sites from which data are used “... are generally located nearby the site under consideration but have not been adversely affected by human activities.” This description is accurate for the Wheeler River Project aquatic LSA which is in an unimpacted, remote area of Saskatchewan’s boreal forest.</p> <p>We refer the reviewer to Appendix 10-A, Appendix A Section 3.2 for consideration of modelled average water baseline concentrations of COPCs and a comparison to measured values. The plots show trends over time for selected COPCs and the generally good agreement between the measured and modelled concentrations.</p> <p>Based on the data presented and methodology provided in relevant guidance, the baseline water quality data collected are suitable for the purposes of the EIS and the application of additional conservatisms in the use of the data provide a conservative (i.e., protective) framework for evaluating potential effects.</p> <p>As shown in Attachment IR-107 (Round 4), surface water</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									quality sampling will be conducted monthly during the open water period and twice under ice. Per CNSC licensing requirements, the new water quality data along with updated effluent quality data will be integrated into the risk assessment supporting Denison’s application for a CNSC licence to operate and prior to effluent release to the environment.
IR-108	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.2.3.3 Aquatic Environment	<p><b>Context:</b> Tables 8.2-2 and 8.2-3 provide summaries of the baseline surface water quality in the LSA. No justifications for the selection of water quality guidelines have been provided. COPCs that require calculations based on other parameters such as hardness, pH, or temperature to derive guidelines (i.e., ammonia, cobalt, zinc, etc.) should be indicated within the table, with a note specifying the parameter values used in the calculations, so that thresholds may be confirmed. No baseline data for un-ionized ammonia has been provided, which is a Schedule 4 substance requiring monitoring under the MDMER. For cobalt, manganese, and vanadium, Federal Environmental Quality Guidelines (FEQGs) and/or CCME Canadian Water Quality Guidelines (CWQGs) for the Protection of Aquatic Life have not been included. A guideline of 26 mg/L has been provided for molybdenum as a Saskatchewan Environmental Quality Guidelines (SEQG), however the actual SEQG is 31 mg/L and the CCME CWQG is 0.073 mg/L.</p> <p><b>Rationale:</b> In order to assess potential changes to surface water quality from Project related activities, ECCC requires that data on all parameters that require MDMER effluent and receiving environment monitoring be provided for assessment, including accurate water quality guidelines where available.</p>	<ol style="list-style-type: none"><li>1. Update Tables 8.2-2 and 8.2-3 to include all COPCs that require effluent characterization and receiving environment monitoring under the MDMER.</li><li>2. Update Tables 8.2-2 and 8.2-3 to include missing or corrected water quality guidance thresholds, and information on values used to derive thresholds for COPCs that are dependent on general parameters.</li></ol>	<p>A number of additional corrections were provided in the supplementary information provided by Denison on July 2<sup>nd</sup>, 2024. However, the following remains outstanding:</p> <ul style="list-style-type: none"><li>• In Table 8.2-3, the long-term benchmark for ammonia as N is 5.74 mg/L for all stations except SA-4, SA-5 and SA-6, where it is 6.98 mg/L. Additionally, the TDS long-term benchmark of 500 mg/L based on SEQG, found in Table 8.2-8 is not included in Tables 8.2-2 or 8.2-3.</li></ul> <p>This IR is accepted for the purposes of the EA review, and the following must be corrected in the final EIS submission package:</p> <ol style="list-style-type: none"><li>1. In Table 8.2-3, confirm if the long-term benchmark of 6.98 mg/L for ammonia as N for stations SA-4, SA-5 and SA-6 is correct and provide justification as to why the benchmark differs at these stations.</li><li>2. In Table 8.2-2 and 8.2-3, confirm the correct long-term benchmark for unionized ammonia as it currently differs between various stations.</li><li>3. For consistency, update Tables 8.2-2 and 8.2-3 to include the Total Dissolved Solids (TDS) benchmark utilized in Table 8.2-8.</li></ol>	Accepted	n/a
IR-108	IR-108-R1	ECCC	Change to an environmental component due to	Section 8.2.3.3 Aquatic Environment  IR-108 Response from Denison	<p><b>Context:</b> Incorrect benchmark environmental quality guidelines and guidelines that cannot be verified remain within the updated Tables 8.2-2 and 8.2-3 provided in the Proponent’s response. The Proponent provided an Aluminum Saskatchewan Environmental Quality Guidelines (SEQG) value of 0.005 mg/L in both tables. This is incorrect and appears to be the guideline for irrigation, not the guideline for protection of aquatic biota. The Proponent provided a Molybdenum SEQG of 26 mg/L in both tables. This value is incorrect. The correct SEQG for Molybdenum is 31 mg/L and the Canadian Water Quality Guideline (CWQG) is 0.073 mg/L. The Proponent provided a Nitrate SEQG of 13.29 mg/L in both tables. This value is incorrect. The correct SEQG for Nitrate is 3 mg/L and the CWQG is 13 mg/L.</p> <p><b>Rationale:</b> In order to verify the benchmark environmental quality guidelines that are calculated based on environmental modifying factors such as pH, hardness and</p>	<ol style="list-style-type: none"><li>1. Update Tables 8.2-2 and 8.2-3 to include footnotes with the concentrations of environmental modifying parameters such as pH, hardness and DOC used to derive guidelines for Aluminum, Cadmium, Copper, Lead, Manganese, Nickel and Zinc.</li><li>2. Update Tables 8.2-2 and 8.2-3 to include the correct benchmark guideline value for Aluminum, Molybdenum and Nitrate. Include the concentrations of environmental modifying parameters needed for deriving guidelines. If the most stringent guideline value is not selected for use, provide a rationale for use of the chosen guideline.</li><li>3. Update Tables 8.2-2 and 8.2-3 to include the calculated</li></ol>	In follow up to outstanding corrections following the Feb 10 <sup>th</sup> submission, supplementary information provided by Denison on July 2, 2024 resolved these issues.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					dissolved organic carbon (DOC), the specific concentrations of these environmental modifying parameters used in the calculations must be provided. Additionally, incorrect benchmarks for Aluminum, Molybdenum, and Nitrate remain within the updated tables provided by the Proponent. No benchmark was provided for Manganese. It is not clear if Total Chromium or Hexavalent Chromium was measured as the table does not specify, and the benchmark provided was for Hexavalent Chromium. This information is required to understand potential changes to surface water quality from Project related activities and facilitate threshold confirmation. Use of the incorrect threshold could allow for effluent to be discharged at the wrong concentration.	guideline value for manganese and the environmental modifying parameter concentrations used to calculate the guideline. A benchmark environmental quality guideline has not been provided for Manganese, however a chronic CWQG guideline exists that can be derived based on environmental modifying parameter concentrations.  Update Tables 8.2-2 and 8.2-3 to specify if Total Chromium or Hexavalent Chromium was measured.  See also related IR-115-R1.			
IR-109	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.2.4.1.1 Aquatic Environment	<p><b>Context:</b> In this section it is stated “Treated water from the IWWTP will be pumped to the three Effluent Monitoring and Release Ponds (each 3,300 m3). These ponds will be designed to hold effluent for 72 hours for testing before discharge to the environment” (p. 8-75). It is unclear what procedure will be followed if effluent in monitoring ponds does not meet discharge requirements following testing.</p> <p>Additionally, it is also stated that “Treated water in the Effluent Monitoring and Release Ponds will be monitored prior to release to a surface waterbody or injected into groundwater via deep well injection.” However, the MDMER pursuant to the Fisheries Act requires all mine effluent and seep. From the mine site that contain deleterious substances be discharged through a final discharge point.</p> <p><b>Rationale:</b> In order to fully understand effluent management, more information is required regarding the procedure for managing effluent in monitoring ponds that does not meet discharge requirements. It is unclear how effluent that does not meet discharge requirements will be managed if it needs re-treatment and re-testing prior to discharge.</p> <p>ECCC reminds the Proponent that Project effluent from all final discharge points must meet federal legislation requirements.</p>	Provide further information regarding management of effluent in monitoring ponds that does not meet the requirements for discharge under the MDMER.		Accepted	n/a
IR-110	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.2.4.1.1 Aquatic Environment  Appendix 8-E, Section 2.1	<p><b>Context:</b> It is stated that the diffuser at the final effluent discharge point will be located in approximately 3m of water. However, in Figure 8.2-5 displaying the location of the proposed diffuser and lake bathymetry, the diffuser location seems to be located in 2-2.5m of water. A similar image in Figure 1 Section 2.0 of Appendix 8-E also indicates that the diffuser seems to be located in 2-2.5m of water. Additionally, while thermal effects are unlikely, this cannot be confirmed until a more detailed diffuser design is provided for review.</p> <p><b>Updated Rationale:</b> The Proponent should confirm the location and depth of the proposed diffuser in order to confirm that modelling predictions for effluent discharged into the receiving environment are accurate.</p> <p>A review of the final discharge design is necessary to confirm the location and depth of the proposed diffuser and modelling predictions for effluent discharged into the receiving environment.</p>	Provide confirmation of the diffuser depth and location.  ECCC requests the opportunity to review the finalized diffuser design once it is available.	Denison has captured a commitment in version 2 of the Commitments Register (July 17, 2024) that the final diffuser configuration will not change the environmental assessment conclusions of risk to aquatic receptors and that water quality will remain below guidelines (ID 8-9), so this IR has been accepted.  Note, if there are deviations from predicted effluent and near-field surface water concentrations of COPCs and risk to aquatic receptors due to the finalized diffuser design, this is expected to be addressed through Denison identifying and implementing mitigation measures (e.g., treatment) to ensure that the environmental assessment conclusions of risk to aquatic receptors will not change and that water quality will remain below guidelines. This must also be factored into Denison's EA Follow-Up Program  <i>Any outstanding issues will be further assessed as part of licensing technical reviews, prior to the granting of a licence.</i>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-111	-	CNSC	Fish and fish habitat	Section 8.2.4.2.2, Controlled Discharge	<p><b>Context:</b> This section of the EIS indicated that the scenario was assessed using a conservative assumption of a continuous freshwater withdrawal rate of 40.5 m3/hr, and a continuous effluent discharge rate of 81.0 m3/hr.</p> <p><b>Rationale:</b> The withdrawal rate assessed is half of the effluent rate, it is unclear from the text where the other half of the volume of effluent is coming from, if not drawn from the lake.</p>	Please clarify where the other half of the total volume of effluent discharged is from in the water balance between water intake and effluent.		Accepted	n/a
IR-112	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.2.4.2.2, Aquatic Environment  Appendix 8-E, Section 1.2.1  Appendix 10-A (ERA), Section 3.1	<p><b>Context:</b> This section of the EIS states that, “for the purpose of assessing the scenario of greatest potential effects, the Project was assessed as having a continuous freshwater withdrawal rate of 40.5 m³/hr and a continuous effluent discharge rate of 81.0 m³/hr.” (p. 8-21)</p> <p>However, several sentences later it is stated that, “The approach to assessing Project-related effects on the Surface Water Quality VC was conservative for the following reasons: The assessment was based on a continuous (year-round) discharge rate at an expected average effluent discharge of 0.0101 m3/s (or 36.5 m3/hr) throughout Construction, Operation, and Decommissioning...”</p> <p>This is a continuous theme throughout Section 8, Aquatic Environment, where the discharge rate for the surface water quality assessment changes between 36.5 m3/hr and 81.0 m3/hr. However, in Appendix 10-A (ERA) the 36.5 m3/hr discharge rate is the only value used for the near and far-field modelling.</p> <p>It should be made clear in the main body of the draft EIS that the average effluent discharge rate of 36.5 m3/hr has been used as the input for the near- and far-field modelling for effluent, surface water and sediment quality predictions. The maximum upper bound discharge rate is 81 m3/hr; however, modelling for effluent, surface water and sediment quality was not completed for this discharge rate.</p> <p><b>Rationale:</b> It remains unclear throughout the draft EIS that all predictions of COPC concentrations in effluent, and receiving environment surface water and sediment are based upon the effluent discharge rate of 36.5 m3/hr, and not the maximum upper bound discharge rate of 81 m3/hr. All conclusions about risk to the environment and aquatic and terrestrial biota must make this clear. If the Proponent wishes to make conclusions based on the maximum upper bound discharge rate of 81 m3/hr, modelling needs to be conducted using this rate of discharge.</p>	<p>1. Confirm that the surface water quantity, quality, and aquatic biota risk assessments and modelling, were conducted using the discharge rate for 36.5 m3/hr within the draft EIS.</p> <p>2. Revise any statements or conclusions in the draft EIS to improve clarity about the usage of the maximum upper bound discharge rate of 81 m3/hr. Remove statements regarding use of the discharge rate of 81 m3/hr during modelling and risk assessments to the receiving environment as needed.</p>		Accepted	n/a
IR-113	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.2.4.2.3 and Section 8.4.7.6, Aquatic Environment	<p><b>Context:</b> No quantitative assessment of climate change has been conducted. Representative concentration pathways (RPC) projections for climate change have not been integrated with near-and far-field modelling to assess impacts to surface water quality or sediment quality in the future.</p> <p><b>Rationale:</b> Changes in air and water temperatures, precipitation, snow melt, ice formation, etc., due to climate change can all influence COPC concentrations in</p>	Provide a quantitative analysis of the potential impacts of predicted COPCs from mine effluent to surface water and sediment quality with climate change scenarios for the Project lifespan incorporated into modelling. Include modelling predictions regarding the influence of changes to air and water temperatures, precipitation, snow melt, ice formation, etc., on COPC concentrations in surface water and sediment.	<p>In order to resolve this IR, CNSC Staff expect that Denison:</p> <p>Make a commitment to not discharge during unusually low flow scenarios, and,</p> <p>Make a commitment to complete a sensitivity analysis during licensing after the BATEA has been completed.</p>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					surface water and sediment. It is not possible to assess the potential impacts from climate change on predicted surface water and sediment COPC concentrations with the current information.		<p>These commitments must be reflected in the final EIS submission package.</p> <p><i>This IR has been accepted for the purposes of the current EA process, the outstanding issue below will be further assessed as part of licensing technical reviews, prior to the granting of a Licence.</i></p> <p>The Proponent suggests that the requested quantitative analysis is not necessary and contends that potential climate change effects on water quality should instead be addressed through mitigation measures, monitoring and adaptive management.</p> <p>The Proponent’s approach does not sufficiently characterize the range of potential effluent and water quality predictions. Climate change analysis is lacking, and a sensitivity analysis was not conducted in order to further understand uncertainty and drivers of the model results. Further, some aspects of water quality modeling are not sufficiently conservative, including use of the geometric mean (instead of the 95<sup>th</sup> percentile) as the baseline concentration for constituents, and pooling data from all lakes, which would mask any differences between the lakes.</p> <p>It is therefore not known whether water quality exceedances may be predicted under climate change scenarios. Without estimating the potential influence of climate change on water quality, it is unclear whether the proposed water quality mitigation measures are adequate. Climate change may impact the assimilative capacity of the receiving waterbody, therefore the present day 7Q10 or low flows may vary under future climate conditions. A sensitivity analysis would further refine predictions of how the 7Q10 or low flows may vary with climate change and therefore provide insight into how water quality may be impacted as well.</p> <p>In order to resolve this issue, Denison will be expected to:</p> <ul style="list-style-type: none"><li>Conduct a sensitivity analysis of low flows (7Q10 low flow, monthly low flow and monthly average flow) and high flows to assess how low and high flows may change under future climate conditions and the potential implications on water quality predictions made during the EA phase.</li></ul>		
IR-113	IR-113-R1	ECCC	Fish and fish habitat	Section 8.2.4.2.3 and Section 8.4.7.6, Aquatic Environment  IR-113 Response from Denison	<p><b>Context:</b> The Proponent states the following, “The PMP is very conservative (e.g., assumes effectively a full year of precipitation in one event) under both existing and future conditions (climate change)”. This statement suggests that the PMP value utilized considers future climate changes such as possible changes in the frequency or intensity of extreme precipitation events.</p> <p><b>Rationale:</b> As noted by the Proponent, increases in extreme rainfall are anticipated with a warmer climate. For precipitation extremes across Canada, the relative change in event frequency is expected to be larger for more extreme and rarer events. Given that the extreme precipitation is expected to intensify in the future</p>	Clarify if climate change has been considered in the PMP value provided. If it has not been considered, discuss how potential increases in PMP have been and/or need to be considered in the Project design.  <b>Reference:</b> Kunkel, K., Karl, T. R., Easterling, D. R., Redmond, K., Young, J., Yin, X., & Hennon, P. (2020). Probable maximum precipitation and climate change. <i>Geophysical Research Letters</i> , 1402-1408.	<p><i>This IR has been accepted for the purposes of the current EA process, and the outstanding issues below will be further assessed as part of licensing technical reviews, prior to the granting of a Licence.</i></p> <p>The Proponent has not clarified if climate change has been considered in the PMP value provided or discussed how potential increases in PMP have been or need to be considered in the Project design.</p> <p>Thermodynamic effects on atmospheric moisture will lead to intensification of local extreme precipitation in the future. Probable maximum precipitation (PMP)</p>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					(Kunkel et al. 2013), the Proponent should consider how these potential changes will influence design values such as PMP.		<p>is defined as the greatest accumulation of precipitation for a given duration meteorologically possible for an area (Kunkel et al., 2013). PMP values may increase with climate change.</p> <p>In the response to IR-113 R1, the Proponent states that “the design basis PMP is robust and inclusive of projected total annual precipitation under a high carbon scenario”. It is unclear from this statement how the analysis provided indicates that the PMP is inclusive of climate change.</p> <p>The Proponent should clarify how the analysis that they provided shows that the design PMP considers climate change, and indicate if or how the potential for increased PMP has informed site water management for the mine life and into post-closure and considered in the development of mitigation measures.</p> <p><b>Reference:</b> Kunkel, K. E., Karl, T. R., Easterling, D. R., et al. 2013. Probable maximum precipitation and climate change. Geophysical Research Letters 40(7), 1402–1408. Available at: 10.1002/grl.50334</p>		
IR-114	-	ECCC  CNSC	Change to an environmental component due to hazardous contaminants	Section 8.2.4.2.3 and Section 8.2.4.2.4	<p><b>Context:</b> Tables 8.2-9, 8.2-10 and 8.2-13 demonstrate predicted maximum effluent concentrations of COPCs and maximum predicted receiving environment concentrations in the near- and far-field. General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, TSS and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization.</p> <p>For zinc, it is unclear how guidelines have been calculated when CCME thresholds can only be derived with hardness values &lt;250 mg/L. Additionally, water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment baseline concentrations.</p> <p>Mercury has been identified as a COPC of interest to Indigenous groups for the proposed Project. Table 8.2-8 indicates that background concentrations of mercury in LA-5 are low, and predicted effluent concentrations are also low. However, no information has been provided on background methylmercury concentrations or expected atmospheric deposition of mercury from Project related emissions. Predicted effluent concentrations of 3915 mg/L of sulphate are quite high, and sulphate is known to increase mercury methylation rates in aquatic environments.</p> <p><b>Rationale:</b> A review of all modelling results for all COPCs under the MDMER will assist ECCC in understanding the potential risks to the receiving environment. ECCC recommends the use of the most stringent guidelines for the protection of aquatic biota. All water quality thresholds should be derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC</p>	<ol style="list-style-type: none"><li>1. Update all tables to include all COPCs with required monitoring under the MDMER including acute and chronic thresholds.</li><li>2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and use water quality guidelines that are protective of aquatic biota.</li><li>3. Provide baseline data on the concentrations of methylmercury in surface water, sediment and fish tissues (i.e., large-bodied sports fish and small-bodied forage fish) in the LSA and RSA receiving environment to establish a baseline prior to potential Project impacts.</li><li>4. Provide an assessment of risk from methylmercury to ecological receptors due to changes in sulphate concentrations in effluent, and potential deposition of mercury from Project related atmospheric emissions in the receiving environment.</li></ol>	<p>In a supplementary submission provided on July 5<sup>th</sup>, 2024, Denison provided corrections to some tables. However, errors and conflicting information remain within and between tables.</p> <p><u>In order to resolve this IR, Denison are expected to correct the following issues:</u></p> <ol style="list-style-type: none"><li>1. Provide the following updates to Tables 8.2-8, 8.2-10, 8.2-13, and 8.2-14 to correct the errors outlined. Additionally, in Table 8.2-13 MDMER Schedule 4, the maximum authorized effluent concentration limits are not appropriate for use as short-term benchmark water quality guidelines. The Schedule 4 limits are only applicable to effluent and represent concentrations in effluent that cannot be exceeded at end-of-pipe, not to receiving environment surface water concentrations, and are not a reliable indicator of acutely lethal concentrations of constituents in receiving environment surface water.</li></ol> <ul style="list-style-type: none"><li>• Tables 8.2-8 and 8.2-10:<ol style="list-style-type: none"><li>A. Temperature: long-term screening criteria is “ambient temp” and should be updated to “narrative”, as has been used in updated Tables 8.2-2. The narrative is already included in the footnotes of Table 8.2-8 and 8.2-10, so the tables should be updated as well.</li></ol></li><li>• Table 8.2-13:<ol style="list-style-type: none"><li>A. Cadmium: both short-and long-term benchmarks are erroneous and should be corrected to values found in updated Table 8.2-2.</li><li>B. Chloride: long-term benchmark is erroneous and should be corrected to value found in updated Table 8.2-2.</li></ol></li></ul>	Not Accepted	<p><b>Note: For the complete history of the FIRT’s comments and Denison’s responses to this IR, refer to Appendix A below. Any attachments associated with the IR response in this table are available in Appendix A.</b></p> <p>1) The updates were completed as requested. In Table 8.2-13 MDMER Schedule 4 maximum authorized effluent limits were removed and tables updated. Tables 8.2-8 and 8.2-10</p> <ol style="list-style-type: none"><li>a) Table were updated to include “narrative” rather than “ambient temp” as requested.</li></ol> <p>Table 8.2-13:</p> <ol style="list-style-type: none"><li>A) Cadmium values were checked and were correct, however, chloride values were incorrect and had the</li></ol>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>exceedances of water quality thresholds.</p> <p>Increased sulphate availability can lead to increased methylation rates of mercury and methylmercury in sediment and surface water. Methylmercury is a toxin that can bioaccumulate within the food chain and present risks to aquatic biota and wildlife consuming aquatic biota. Potential changes to methylmercury concentrations in water quality, sediment and fish tissues should be assessed due to the proposed sulphate loadings in effluent.</p> <p>Additionally, in accordance with the MDMERs, Denison will be required to demonstrate that their effluent quality meets the limits in the MDMER. Denison is expected to provide the predicted effluent quality for lead, nickel, and un-ionized ammonia to demonstrate compliance with the MDMERs.</p>		<p>C. Iron, Lead-210, and Uranium-234 &amp; -238: long-term benchmarks are missing and should be the same values found in updated Table 8.2-2 or Table 8.2-8.</p> <p>D. Alkalinity and nitrate have been added to the table as requested, however predicted maximum concentrations are only presented for Whitefish Lake Middle and South. The proponent should describe why there are no estimates for these parameters in other lakes, and how they intend to fill these gaps.</p> <ul style="list-style-type: none"><li>Table 8.2-14:<ul style="list-style-type: none"><li>A. The removal of constituents of potential concern from future centuries review need to be justified by the proponent. Otherwise, all parameters included in Table 8.2-13 should also be included in Table 8.2-14. Presently alkalinity, nitrate, uranium-234 &amp; -238 are missing.</li><li>B. Uranium: the long-term screening concentration is erroneous and should be corrected to the value found in all other tables.</li></ul></li><li>Footnotes:<ul style="list-style-type: none"><li>A. The footnotes for each table should reflect what is in the table.</li><li>B. All tables: acronyms used in the references that need explanations in the footnotes include: “CCME”, “HC”, “BC MOE”, “FEQG” and “MDMER”.</li><li>C. All tables: explanations in the footnotes for acronyms that were not used in the tables: “SSWQO”, “TKN”, and “TOC”. Removing these would increase clarity.</li><li>D. Footnote “*” should be removed. It explains how ammonia concentration is calculated and is not referred to in Tables 8.2-8, 8.2-10 &amp; 8.2-13. In Table 8.2-14 it is associated by cadmium, which does not make sense.</li><li>E. Footnote (4) should be removed. It states the short-term screening criterion for chloride limit is “<i>Based on water hardness &gt;0 to &lt;17 mg/L</i>”. This appears erroneous since neither the CCME guideline nor the SEQG is hardness based.</li><li>F. Tables 8.2-13 &amp; 8.2-14 do not refer to the footnotes “TDS”, “narrative”, (4) and (7), and removing them would help clarity.</li></ul></li></ul> <p>2. CNSC/ECCC staff agree that the minor baseline exceedances of copper concentrations in water do not constitute the use of a guideline that is a magnitude of order greater than the copper FEQG. The copper FEQG guideline is the most restrictive guideline and based on current science and site-specific conditions, whereas the CCME guideline is quite dated and does not incorporate the use of site-specific environmental modifying factors. As there are background concentrations of copper that do exceed the copper FEQG, there is the potential that biota may already be stressed due to these exceedances. However, there is not currently enough baseline characterization data within the immediate receiving environment to</p>		<p>cadmium footnote associated with them. This was corrected.</p> <p>B) Chloride long term benchmark was corrected to the value found in Table 8.2-2.</p> <p>C) Iron, Lead-210 and Uranium-234 and Uranium-238 long-term benchmarks were missing but have been added as per the values consistent with Table 8.2-2 and 8.2-8.</p> <p>D) Alkalinity and nitrate were not collected for other locations during baseline assessments. It is intended that these constituents will be added to the pre-construction water sampling suite of parameters to ensure consistency and completeness for additional analysis conducted for licencing.</p> <p>Table 8.2-14</p> <p>A) <b>Nitrate:</b> Nitrate was not included in the Geochemical Reactive Transport Model (Appendix 7C of the Final EIS) as it is not considered a COPC associated with the ISR mining process for this project. Nitrate concentrations</p>

Footnote 7 was missing in the table, so was added. Footnote 4 removed from all tables.</div></div> <div>2)</div> <div>A) The screening criteria used for the EIS and ERA (and all relevant tables) has been updated to utilize the more stringent FEQG guideline of 0.0002 mg/L.</div>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									See Attachment IR-114 Round 4. B) The TRVs have been re-evaluated using the FEQG Biotic Ligand Model. See Attachment IR-114 Round 4. C) Denison is committed to collection of further baseline data in the immediate receiving environment (LA-5) to adequately characterize copper concentrations in water (refer to response to Round 4 IR-107 for water quality results from Whitefish Lake from June to September 2024) and sediment quality and any potential exceedances of water quality guidelines and this information will be further presented and analyzed as part of licensing.
IR-115	-	ECCC	Fish and fish habitat	Section 8.2.4.2.3 Aquatic Environment  Appendix 10-A (ERA), Section 3.1.1.1	<b>Context:</b> Table 8.2-8 demonstrates baseline concentrations of COPCs in LA-5 South Whitefish Lake, their respective water quality guidelines from applicable sources, and proposed Project thresholds. General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, Total Suspended Solids (TSS) and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization. Water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment baseline concentrations. The water quality objective selected for molybdenum is the 31 mg/L SEQG rather than the CCME guideline of 0.073 mg/L.  <b>Rationale:</b> ECCC recommends the use of guidelines that will ensure the protection of aquatic biota. All water quality thresholds should be derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC exceedances of water quality thresholds.	1. Update Table 8.2-8 to include all COPCs with required monitoring under the MDMER.  2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and are at levels protective of aquatic life.  3. Provide additional information to justify the use of the selected water quality guideline for molybdenum.	Please see the response to IR-115-R1 (below).	Accepted	n/a
IR-115	IR-115-R1	ECCC	Fish and fish habitat	Section 8.2.4.2.3 Aquatic	<b>Context:</b> In the Proponent’s response to item two, it is mentioned that the derived water quality thresholds used in Table 8.2-8 and in the assessment (Section	1. Update Table 8.2-8 to include the following COPCs: un-ionized ammonia, aluminum, iron, manganese,	In a supplementary submission from July 5 <sup>th</sup> , 2024 Denison has provided updated information.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
				Environment  Appendix 10-A (ERA), Section 3.1.1.1  IR-115 Response from Denison	<p>8.2.4.2.3, Aquatic Environment; Appendix 10-A (ERA), Section 3.1.1.1) are based on hardness concentrations found in effluent. The Proponent mentions that hardness derived from IWWTP discharge will consider IWWTP discharge on the receiving environment and provide “a reasonable estimate of expected hardness in effluent”.</p> <p>However, this does not consider induced hardness (i.e., hardness concentration increases in the receiving environment over the lifecycle of the Project) from effluent contributions as a Project effect; the receiving environment baseline concentrations of hardness have been altered due to inputs from Project effluent. Providing only one estimate of expected effluent hardness in the receiving environment is not an appropriate means of conducting the effects assessment.</p> <p>Additionally, the following COPCs have not been included in the updated table provided in the Proponent’s response: un-ionized ammonia, aluminum, iron, manganese, thallium and total dissolved solids (TDS). It is noted that these COPCs are also subject to monitoring requirements under the <i>Metal and Diamond Mining Effluent Regulations</i> (MDMER).</p> <p><b>Rationale:</b> Background concentrations of un- ionized ammonia, aluminum, iron, thallium, manganese and TDS are required to determine potential effects to the environment. The Proponent will also require this information to satisfy their obligations under the MDMER.</p> <p>The purpose of the surface water quality assessment is to determine if changes to the receiving environment over the project lifecycle will have significant adverse effects on biota.</p> <p>Changes from baseline in hardness concentrations in the receiving environment due to the deposition of effluent is a Project related effect and therefore providing a single baseline water quality threshold which is applicable only to one set of conditions is not an appropriate method to evaluate impacts across a shifting hardness baseline.</p> <p>Water hardness is an environmental modifying factor, various concentrations of hardness influence the toxicity of other COPCs in the aquatic environment. Using water quality thresholds that have been derived from high effluent hardness concentrations will not be protective of aquatic biota, particularly in the early stages of the project lifecycle when receiving environment water quality will be similar to baseline water quality.</p>	thallium and total dissolved solids (TDS).	<p>Denison will be required to update the screening criteria for ammonia, aluminum, iron and lead during licensing review of the ERA. These updates are not anticipated to impact the conclusions of significance to the EA, and therefore are not required at this time.</p> <p><i>Any outstanding issues will be further assessed as part of licensing technical reviews, prior to the granting of a licence.</i></p>		
IR-116	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.2.4.2.5, Section 8.4.4.2.5 and Section 8.5.4.2.3	<p><b>Context:</b> Tables 8.2-14, 8.4-9 and 8.5-5 demonstrate predicted mass flux (in mg/s) of COPCs in groundwater during the future centuries scenario. The table does not provide any information on actual surface water concentrations of COPCs or accumulation in concentrations over time. It is not possible to determine what the COPC concentrations in surface water and sediment will be during the future centuries scenario with the current information.</p> <p>Additionally, only a subset of parameters have been provided in this table based on</p>	<p>1. Provide the predicted water and sediment quality concentrations of COPCs in the receiving environment for the future centuries scenario.</p> <p>2. Include data for a greater suite of COPCs that were assessed as having potential to be at elevated concentrations in groundwater.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					parameters that were elevated in effluent after treatment. Groundwater may have a variety of different COPCs with elevated concentrations as it will migrate directly from the ore body area and not receive treatment.  <b>Rationale:</b> It is not possible for ECCC to assess the predicted concentrations of COPCs in surface water and sediment, and therefore risk to aquatic biota during the future centuries scenario with the provided information.				
IR-117	-	CNSC	Human health with respect to hazardous contaminants	Section 8.2.4, Table 8.2-9	<b>Context:</b> CNSC staff note that some of the effluent quality predictions in the EIS are quite high for a uranium mine and mill facility compared to the existing facilities.  For example, the upper bound effluent quality of molybdenum is 2.5 mg/L. In 2021, the highest monthly mean concentration at the existing uranium mine and mill facilities is 0.213 mg/L.  Also, the upper bound effluent quality of copper is 0.022 mg/L. In 2021, the highest monthly mean concentration at the existing uranium mine and mill facilities is 0.002 mg/L.  <b>Rationale:</b> Surface water quality models should be based on the anticipated effluent quality. From discussions with Denison, it appears that the effluent quality predictions may change based on the results of more bench scale tests that are still being conducted and continued optimization of the design of the water treatment plant.	Please provide the anticipated effluent quality of the constituents of potential concern during normal operations.  Once Denison has refined the effluent quality predictions, Denison is expected to update the inputs into the surface water quality model.		Accepted	n/a
IR-118	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.2.6.1, Section 8.4.6.1 and Section 8.5.6.1, Aquatic Environment	<b>Context:</b> It is unclear if Tables 8.2-16, 8.4-12, 8.5-7 and 8.5-8 take into consideration potential effects from groundwater seepages of COPCs to surface water and sediment quality in the future centuries scenario. No information regarding the future centuries scenario has been provided in the rationale summary for ratings.  <b>Rationale:</b> Groundwater seepage of COPCs may have future impacts to surface water quality, sediment quality and aquatic receptors; however, the extent of residual effects is unclear without further information.	Provide further information regarding how groundwater seep. Of COPCs may have future impacts to surface water quality, sediment quality, and aquatic receptors, and any residual effects that may persist.		Accepted	n/a
IR-119	-	CNSC	Fish and fish habitat	Section 8.3.1.2, Table 8.3-1, Sediment quality	<b>Context:</b> Sediment quality isn't considered a key indicator for fish and fish habitat, but the accumulation of contaminants in sediment porewater without habitat alteration is similar to the key indicator 'change in surface water quality from baseline conditions' that is considered.  <b>Rationale:</b> It is not clear whether sediment was just considered for physical disturbance, and why chemical changes are missing from key indicator list for fish and fish habitat.	Please provide the rationale for exclusion of sediment quality from the key indicator list for fish and fish habitat.		Accepted	n/a
IR-120	-	CNSC	Aquatic species	Section 8.3.3 and 8.5, Aquatic Environment	<b>Context:</b> Although downstream impacts are not predicted by Denison it is important from an ecosystem perspective to establish baseline locations to monitor for potential cumulative effects to the aquatic environment due to the Key Lake and Wheeler River Operations to ensure the aquatic environment is being protected from cumulative impacts.	If Denison has not collected baseline aquatic studies in the far-field downstream receiving environment of Russell Lake, please provide a rationale for why.	Response is accepted, but also see AD-51 in the Advice to Proponent table.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>Denison should consider adding a far-field exposure location and collecting baseline aquatic ecosystem baseline data in Russell Lake including:</p> <ul style="list-style-type: none"><li>• Water quality/chemistry</li><li>• Sediment chemistry/quality</li><li>• Benthic invertebrate chemistry /community</li><li>• Large-bodied fish tissue/chemistry</li></ul> <p><b>Rationale:</b> Russell Lake is identified as part of the RSA for the aquatic environment, but it appears that no detailed aquatic baseline data was completed in far-field location in Russell Lake. In addition, several Indigenous Nations and communities and local resource users have indicated that Russell Lake is an important body of water both culturally for traditional use and was once used as commercial fishery.</p>	<p>If a far-field Russell Lake location was sampled as part of baseline data collection, more information about the process and results with regards to sampling at Russell Lake should be included in the EIS. This information would be valuable to help determine potential cumulative effects downstream in the Russell Lake drainage system (due to the Key Lake Operation) which has been identified as a key concern and area of interest by several Indigenous Nations and communities.</p>			
IR-121	-	CNSC	Fish and fish habitat	Section 8.3.3.1, Methodology and Metrics	<p><b>Context:</b> In the description of methodology for fish communities and spawning surveys, there’s no mention that could be found for an any evaluation of fish condition, other than sexual condition.</p> <p><b>Rationale:</b> Exposure to other pre-existing stressors could result in abnormal conditions or deformation(s) in existing population, but the extent of existing conditions should be evaluated to ascertain whether the rate is increasing as a result of proposed activities once in operation.</p>	<p>Please provide reference to where fish condition is considered or provide a justification for its exclusion.</p>	<p>Response is accepted, but also see AD-52 in the Advice to Proponent table.</p>	Accepted	n/a
IR-122	-	CNSC	Fish and fish habitat	Section 8.3.8, Monitoring and Follow-up	<p><b>Context:</b> Section 8.3.8 of the EIS states: “Changes in fish communities/populations will be assessed through comparison of Construction, Operation, and Decommissioning results to pre-development.”</p> <p><b>Rationale:</b> Tracking changes in fish communities / populations in reference lakes over time should be conducted, as reference lakes can be used to differentiate natural temporal variation with potential project impacts.</p>	<p>Please include reference lakes, and if it is provided, please reference where in the EIS these are discussed. If there are no reference lakes, these should be included in the monitoring program.</p>	<p>Response is accepted, but also see AD-53 in the Advice to Proponent table.</p>	Accepted	n/a
IR-123	-	ECCC	Change to an environmental component due to radiological contaminants	Section 8.4.3.2.3, Aquatic Environment  Appendix 8-D, Table 3-5	<p><b>Context:</b> Table 8.4-3 provides a summary of the baseline concentrations of COPCs in sediments in the LSA. Sediment quality thresholds and justification for the selection of those thresholds have not been provided. Table 3-5 in Appendix 8-D does provide benchmarks but the selection of benchmarks is not discussed, and the most stringent guidelines are not used for some COPCs. Additionally, there is no data provided for sediment concentrations of mercury, which is a COPC that requires surface water quality monitoring and effluent characterization under the MDMER.</p> <p><b>Rationale:</b> Further information should be provided regarding any exceedances of sediment quality thresholds in baseline concentrations of COPCs, which should be recommended for further assessment of risk due to effluent discharges.</p>	<p>1. Provide sediment quality thresholds and justification for the selection of those thresholds for comparison against measured baseline COPC concentrations in the LSA.</p> <p>2. Provide data on baseline concentrations of mercury in sediment.</p> <p>3. Identify any COPCs with baseline concentrations that exceed sediment quality thresholds in the LSA.</p>		Accepted	n/a
IR-124	-	ECCC	Change to an environmental component due	Section 8.4.4.2.3, Aquatic Environment	<p><b>Context:</b> Table 8.4-7 provides maximum concentrations of surface water COPCs in sediment. The following COPCs, which are required to evaluate the risk from effluent to sediment quality, were not evaluated:</p>	<p>1. Provide the information on baseline exceedances of COPCs in sediment.</p> <p>2. Provide an assessment of risk for any COPCs that have</p>	<p>Following review of a supplementary submission provided on July 2<sup>nd</sup>, 2024, concerns remain related to:</p>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
			to hazardous contaminants		<ol style="list-style-type: none"><li>1. COPCs that have monitoring requirements in receiving environment surface water and effluent under the MDMER,</li><li>2. COPCs that exceed water quality guidelines in effluent, and,</li><li>3. COPCs that have baseline concentrations that exceed sediment quality thresholds in the receiving environment.</li></ol> <p><b>Rationale:</b> Due to the lack of information on COPCs with baseline concentrations that exceed sediment quality guidelines, and COPCs that require monitoring under the MDMER, a determination on risk to sediment quality and aquatic biota cannot be made.</p>	<p>baseline exceedances of sediment quality thresholds in the receiving environment.</p> <p>3. Provide an assessment of risk from any COPCs that require monitoring in the receiving environment and effluent under the MDMER. Please include any COPCs in effluent that will exceed water quality guidelines.</p>	<ul style="list-style-type: none"><li>• Denison’s assessment of water/sediment quality for near field and regional receiving waterbodies using low flow scenarios based on return periods beyond 100 years, as well as near field and regional models.</li><li>• The 7Q10 is considered acceptable low flow to provide conservative predictions for the assessment of water/sediment quality.</li><li>• The modeled results for maximum concentrations of COPC’s shown in tables 3.3 and 3.5 of Appendix 10-A, which show that copper may exceed the new FEQG in freshwater for both operational and post decommissioning phases of the project.</li></ul> <p>For the purposes of this review, this IR is accepted, and these outstanding concerns will be addressed in responses to IR-113 (through sensitivity analysis) and IR-114.</p> <p>See also AD-76 in the Advice to Proponent table.</p>		
IR-124	IR-124-R1	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.4.4.2.3, Aquatic Environment  IR-124 Response from Denison	<p><b>Context:</b> In the Proponent’s response it is stated, “Schedule 5 parameters will be monitored as per the MDMER once under this regulation (i.e., meeting regulated criteria of discharge to the environment [50 m3/day). Please refer to Table 8.2-13 of attachment IR-114. In these cases, COPCs including Schedule 4 parameters were below screening criteria.”</p> <p>If concentrations of Schedule 5 parameters in effluent exceed water quality thresholds, these parameters are necessary for ECCC to examine in the risk assessment to determine the potential for effluent to be acutely lethal and for adverse effects to aquatic biota. These parameters will also be required to be characterized under Section 4, 5 and 7 of the MDMER. As per CSA N288.6-22 Section 7.2.5.2.1, “Screening of environmental concentrations of chemical and radiochemical substances released to the environment should be performed to identify COPCs for further evaluation in the risk assessment. Both measured concentrations and concentrations calculated from release rates may be used in the screening analysis. The screening concentrations should be compared to screening criteria, and chemicals that exceed screening criteria should be identified as COPCs.”</p> <p>As per CSA N288.6-22 Section 7.2.5.4.2, “If COPCs exceed the screening level for one medium, they should be carried forward into the EcoRA for all media that are likely to contribute to exposure. For example, for a given COPC, if a water screening benchmark is exceeded, the same COPC should be carried forward for sediment if its concentration was above the detection limit.”</p> <p>Additionally, updated Table 8.2-13 of attachment IR-114 has been found to be insufficient due to maximum concentrations in surface water for mercury, aluminum, total suspended solids, iron, thallium, manganese, nitrate and phosphorus being absent and the use of incorrect water quality thresholds.</p>	Provide an assessment of risk from any MDMER Schedule 5 parameters that are required to be characterized in effluent and in surface water quality in the receiving environment and that have effluent concentrations that will exceed water quality guidelines derived from environmental baseline conditions.	See response for IR-124.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<b>Rationale:</b> Due to the lack of information on COPCs with concentrations that exceed water quality thresholds in effluent, a determination on risk to sediment quality and aquatic biota cannot be made.				
IR-125	-	CNSC	Fish and fish habitat	Section 8.5, Aquatic Environment and Fish health	<b>Context:</b> Indigenous Knowledge studies and information collected in relation to the Project clearly identified the importance of water quality and fish health to local Indigenous peoples and is discussed throughout the Draft EIS. For example: <ul style="list-style-type: none"><li>“Russell is one lake where I commercially fish. How will this effluent impact the water quality, fish health? Will I be able to sell fish from here? If there is going to water” pollution, I just want to know” (19-LK-ERFNTrip-134.255)</li><li>“How are you going to protect the water quality? We are concerned about mercury in fish, other animals, etc. Is there mercury or arsenic in the uranium solution?” (p. 8-53)</li></ul> <b>Rationale:</b> Several Indigenous Nations and communities and local resources users have indicated Russell Lake is an important body of water both culturally for traditional use and was used as commercial fishery in the past and from an aquatic ecosystem perspective.	One of the many mitigation measures mentioned throughout the aquatic environment section states:  “Denison will work with the associated communities to develop and implement the Project-specific monitoring programs and a framework to share the results for the purpose of assessing the performance of the water management system.” (p.10-32)  Has Denison considered the collection of additional baseline fish tissue species that are of importance to Indigenous Nations and communities and local cabin owners from Russell Lake? Assuming the species would be walleye (commercially and recreationally) and lake white whitefish that is traditionally an important species consumed.  Please provide more information on the engagement to date on the development of the Surface Water Management Program and Monitoring program that Denison is developing and engagement to date with interested Indigenous Nations and communities in the region on fish and fish health.	Response is accepted, but also see AD-51 in the Advice to Proponent table.	Accepted	n/a
IR-126	-	ECCC	Aquatic species	Section 8.5.3  Appendix 10-A (ERA), Section 5.3.1.1.8	<b>Context:</b> The Proponent has used the US Environmental Protection Agency (US EPA) guidelines for the assessment of selenium fish tissue concentrations in Section 8.5.3 of the draft EIS and in the Environmental Risk Assessment (ERA) in Appendix 10-A (ERA) of Section 10.  <b>Rationale:</b> ECCC’s Federal Environmental Quality Guidelines of 6.7 ug/g dry weight fish whole body tissue for selenium should be used, as it is more protective than the US EPA guidelines.	Update the selenium fish tissue assessment in the draft EIS and the Wheeler River ERA (Appendix 10-A (ERA) in Section 10) as needed using ECCC’s FEQG.	Following a supplementary submission by Denison on July 2 <sup>nd</sup> , 2024, it has been determined that item one and two of this IR have been resolved, but item three remains outstanding.  Denison has not provided the information requested to address Item 3 of the Round 3 IR. Including the estimates of error for the predicted selenium concentrations in fish is necessary as the maximum predictions for Northern Pike in Whitefish Lake North and Middle are within 1-2 ug/g dw of the Egg/Ovary FEQG guideline of 14.7 ug/g dw.  <u>In order to resolve this IR, Denison are expected to:</u> <ol style="list-style-type: none"><li>Provide an estimate of error associated with the Northern Pike BAF.</li><li>Include this estimate of error for the results in Table -IR-126-2 and consider this in the effects assessment.</li></ol>	Not Accepted	<b>Note: For the complete history of the FIRT’s comments and Denison’s responses to this IR, refer to Appendix A below. Any attachments associated with the IR response in this table are available in Appendix A.</b>  1. An estimate of the error associated with the Northern Pike BAF is included in Attachment IR-126 Round 4 (see Appendix A to this IR response table).  2. An estimate of the whole body and egg-ovary concentrations using the range of uncertainty (low to high) is included in Attachment IR-126

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									Round 4 (see Appendix A to this IR response table).  Denison will include the information on selenium BAF sensitivity analysis from this IR response in Appendix 10-A of the final EIS (new subsection 6.2.3).
IR-127	-	CNSC	Aquatic environment	Appendix 8-E, Section 1.2.1, Hydrological Inputs	<b>Context:</b> Within this section it states that the 7Q10 low flow rate used in the mixing assessment “was provided verbally to Ecometrix by NewFields Canada during a project meeting on 26 April 2022”  <b>Rationale:</b> The statement that this value was provided verbally is not an infallible method of communicating data, as the value could have been misheard, misremembered, or recorded improperly.	Please verify that the 7Q10 value used in the assessment is the correct value determined by NewFields.		Accepted	n/a
IR-128	-	CNSC	Current use of lands and resources for traditional purposes	Section 9  Various pages in section 11.1, Land and Indigenous Resource Use Section 12 Section 14	<b>Context:</b> The increased road traffic (14-18 trucks per day during construction/operations) may have indirect impact on ungulates, furbearers and wood land caribou presence/absence for traditional and subsistence hunting have been raised to CNSC staff when meeting with Indigenous Nations and communities and are presented in the EIS.  <b>Rationale:</b> The increased traffic and therefore dispersal of game (moose, woodland caribou) due to increased traffic has been raised as a concern with respect to increased mortality on wildlife and decreased ability to practice traditional rights.	How have the potential residual impacts with respect to increased traffic and noise (due to current and future operations) been communicated to Indigenous Nations and communities who use the road #914 for cultural and traditional activities (such as moose harvesting, berry picking and small game and birds)?  Please provide any additional information on the engagement that has taken place to date with Indigenous Nations and communities with respect to concerns and potential impacts on current use of lands and resources due to increased road traffic, and any mitigation measures proposed by Indigenous Nations and communities to minimize the potential impacts.	Response is accepted, but also see AD-54 in the Advice to Proponent table.	Accepted	n/a
IR-129	-	CNSC	Current use of lands and resources for traditional purposes	Section 9 Section 10 Section 11, including Section 11.1.4.3.1 (p. 11-46) Section 12 Section 16	<b>Context:</b> ERFN indicated they are concerned about declining moose populations from an influx of hunters; more people may be accessing the area year after year, and worried populations may be affected by the Project (21-EN-ERFN-473.13).  Further, the EIS highlights that: “Vehicle collisions are the most likely source of direct mortality for moose. Effective mitigation measures (e.g., breaks in snowbanks; speed limits; and exclusion fencing around contaminated waste pads and ponds) will be implemented to reduce moose mortality.” (p. 11-46)  <b>Rationale:</b> The <a href="#">Technical Guidance for Assessing the Current Use of Lands and Resources for Traditional Purposes under CEAA 2012</a> notes: “The views of affected Aboriginal groups on mitigation be considered and included in the EIS. This could assist in ensuring that the environmental effects on the current use of land and resources for traditional purposes are at an acceptable level for the community.”	Please provide additional information on the discussions Denison has had with Indigenous Nations and communities on how to mitigate any residual project impacts on their traditional harvesting activities of large game such as moose.  More information is required to determine if Denison has engaged directly with ERFN/KML and other Indigenous Nations who utilize the area to harvest moose to determine current baseline harvest numbers that provide subsistence, continued cultural identity and community well-being, as well as discussions on how the Project could potentially impact moose populations and the harvesting of moose for traditional practices.	Response is accepted, but also see AD-62 in the Advice to Proponent table.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>Sources for indirect moose mortality (e.g., increased hunter access, changes to health due to sensory disturbances, changes to predator-prey dynamics) may result in mortality outside the Wildlife LSA. The residual effect of change in moose mortality is likely to occur. Although mitigation measures are expected to reduce, but not fully eliminate, the residual effect on moose.</p> <p>The potential residual impact on the moose and other large game populations in the broader regional study area may potentially impact Indigenous treaty rights, culture, and community well-being if the harvesting of moose and large game declines due to increased traffic, noise, and vehicle mortality or increased outside hunting pressure.</p>				
IR-130	-	H. Mulye	Physical stressors (noise and vibration) on wildlife	Section 9, Terrestrial Environment	<p><b>Context:</b> Sensory disturbances such as noise have been identified as stressors for selected wildlife (Ungulates, Furbearers, and Woodland Caribou), birds and amphibians in the Project area. However, there is no consideration of impacts from vibrations on these species. Also, impacts of noise and vibration on reptiles have not been assessed in the Project area.</p> <p><b>Rationale:</b> While noise has been qualitatively assessed for selected wildlife, birds, and amphibians, there is no consideration of project-related vibrations as a sensory disturbance/physical stressor. Sensitive terrestrial species (specifically, herpetofauna, amphibians, invertebrates, and caribou) can be impacted by vibrations emanating from the operation of heavy machinery, blasting activities, and other anthropogenic activities at the Project site.</p> <p>Also, impacts of physical stressors (noise and vibration) on reptiles were not assessed. These species should be included in this assessment due to their sensitivity to noise and vibrations.</p>	<p>Please provide a discussion of impacts of physical stressors (specifically vibrations) on wildlife, birds, and amphibians in the Project area. Specific mitigation measures and/or monitoring for impacts from project-related vibrations should be considered, as appropriate.</p> <p>Also, include reptiles in the assessment of project-related noise and vibrations as sensory disturbance/physical stressor, or a justification for their exclusion.</p>		Accepted	n/a
IR-131	-	ECCC	Migratory birds, Wildlife and Wildlife Habitat	Section 9, Terrestrial Environment	<p><b>Context and Rationale:</b> As per the requirement outlined in Section 79 of the Species at Risk Act (SARA): <i>The person must identify the adverse effects of the project on the listed wildlife species and its critical habitat and, if the project is carried out, must ensure that measures are taken to avoid or lessen those effects and to monitor them. The measures must be taken in a way that is consistent with any applicable recovery strategy and action plans. This is accomplished by ensuring that the Proponent has identified, avoided, lessened and will monitor effects to species at risk.</i></p> <p>As per the CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> pursuant to the Canadian Environmental Assessment Act, 2012: <i>“The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the Proponent intends to implement them and the environmental outcome the mitigation is designed to address. The EIS will describe mitigation measures in relation to species and/or critical habitat listed under the Species at Risk Act (SARA). These mitigation measures will be consistent with any SARA permit, applicable</i></p>	Identify all species at risk listed on Schedule 1 of the Species at Risk Act and their critical habitat that are likely to be affected by the Project and describe how they may be adversely affected by the Project. Describe what measures will be taken to avoid or lessen the effects of each Project activity and stage, and how these effects will be monitored to ensure they are avoided or minimized.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<i>recovery strategy and/or action plan”.</i>  The draft EIS neither lists the adverse effects to all listed schedule 1 SARA species, nor outlines the measures that will be taken to avoid or lessen these effects. The Proponent references that additional species-specific mitigations will be detailed in environmental management plans but has not provided those plans for review.				
IR-132	-	ECCC	Wildlife and Wildlife habitat	Section 9, Terrestrial Environment	<b>Context and Rationale:</b> ECCC has identified that three species at risk arthropods (yellow banded bumble bee, transverse lady beetle, and nine-spotted lady beetle) have ranges overlapping the Project area and these were not mentioned in the draft EIS.	1.Conduct an effects assessment for arthropod species at risk.  2. Explain what mitigation measures will be used to minimize potential effects.		Accepted	n/a
IR-133	-	ECCC		Section 9, Terrestrial Environment	<b>Context and Rationale:</b> There is potential for some species at risk (e.g., myotis species, barn or bank swallows, common nighthawk) to be attracted to and use mine infrastructure (buildings, roads etc.) once constructed for nesting, roosting, or foraging.  Details on mitigation measures and adaptive management with respect to attraction to Project components should be identified to assess residual and cumulative impacts to species at risk.	For all Project phases, describe the mitigation measures and adaptive management to prevent and minimize effects on species at risk that may utilize mine infrastructure.		Accepted	n/a
IR-134	-	ECCC	Wildlife and Wildlife habitat	Section 9, Terrestrial Environment	<b>Context and Rationale:</b> The draft EIS states in multiple places that vegetation clearing may occur year-round.  In order to correspond with the timing of emergence from hibernation, tree clearing should not be conducted during the bat roosting period. If maternity roost trees are removed after pregnant females have established a roost area, there is a higher likelihood of abortion than there would be otherwise.  Species-specific mitigations are required to protect bat SAR.	Provide important roosting dates for bat species at risk in the Project area.	The Proponent provided a complete response regarding the roosting dates for bat species at risk, however follow-up IRs are required.  See follow-up IR-134-R1.	Accepted	n/a
IR-134	IR-134-R1	ECCC	Wildlife and Wildlife habitat	Section 9, Terrestrial Environment	<b>Context:</b> The Proponent has committed to conduct pre-construction and pre-clearing surveys for multiple species, however the timing and methods for the surveys were not provided. Knowing the survey methodology for pre-construction and pre-clearing for little brown myotis and northern myotis is important for assessing cumulative impacts, effectiveness of adaptive management strategies as well as determining how bat species were considered in the EIS.  <b>Rationale:</b> ECCC can determine whether the methodology the Proponent will use to collect data is appropriate and if the methodology would contribute to a more complete understanding cumulative effects and adaptive management strategies.  A clear outline of how timing has been considered and incorporated into the methodologies is required to understand how sensitive periods for bats, such as roosting, have been considered in the EIS. An understanding of the methodologies and how these sensitive periods are being considered is required to evaluate the	The information provided by the Proponent regarding the roosting dates and potential habitat for bats is complete, however, the information related to the pre-construction and pre-clearing surveys is missing details on important habitat features for bat species at risk. As two Species at Risk Act (SARA) schedule 1 listed bat species, little brown myotis ( <i>Myotis lucifugus</i> ) and northern myotis ( <i>Myotis septentrionalis</i> ) have been identified in the Project area, effects need to be identified, avoided, lessened and monitored.	Following a supplementary submission by Denison on July 8 <sup>th</sup> , 2024, this IR has been resolved. The response on bats is sufficient.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					effectiveness of mitigation strategies and adaptive management strategies which are being developed by the Proponent.				
IR-135	-	ECCC	Migratory birds, Wildlife and Wildlife Habitat	Section 9, Terrestrial Environment	<p><b>Context and Rationale:</b> The mitigation measures for birds and wildlife presented in the draft EIS are very general. Additional detail is required for a complete assessment of residual and cumulative Project effects to birds and wildlife.</p> <p>The Proponent has committed to providing a number of plans including, a Decommissioning Plan, a Spill Response Plan, a Waste Management Plan, a Surface Water Monitoring Plan, a Remediation and Closure Plan, a Radiation Protection Plan, a Soil and Vegetation Monitoring Plan, a Wildlife Monitoring Plan, and a Woodland Caribou Management Plan. In order to assess potential affects to migratory birds and wildlife from Project related activities, ECCC requires details on species-specific mitigation measures, and monitoring plans.</p>	<p>The following information should be included in the various plans and should be provided for review during the environmental assessment:</p> <ol style="list-style-type: none"><li>1. For all Project phases, describe the species-specific mitigation measures and responses to prevent and minimize effects on migratory birds or species at risk (SAR) birds and mammals that may utilize mine infrastructure.</li><li>2. Explain how light pollution will be managed and what specific mitigation measures will be used to minimize effects to migratory birds and SAR birds and mammals.</li><li>3. Provide details on what methods will be used for erosion control and how they will prevent sediment from entering waters frequented by migratory birds or SAR. Explain what actions will be taken if the erosion control measures are not successful.</li><li>4. Provide details on noise and other sensory disturbance monitoring and mitigations if noise levels surpass thresholds.</li><li>5. Describe time windows and species- specific mitigations related to maintenance activities such as vegetation management, road or building repair and stream crossing replacements.</li></ol>		Accepted	n/a
IR-136	-	CNSC	Soil Salvage Monitoring	Section 9.1.8.2	<p><b>Context:</b> The Proponent plans to salvage and stockpile soil and organic matter/peat in order to use it in reclamation activities during decommissioning. Periodic monitoring of the stockpiles is proposed to be conducted to verify that soil and organic matter/peat are delineated, stripped, handled, and stockpiled as recommended, and to evaluate the stability of salvaged soil, e.g., in relation to potential erosion and/or degradation. It is unclear whether monitoring includes soil quality in terms of concentrations of COPCs.</p> <p><b>Rationale:</b> It is expected that project-related activities (road and airport traffic, drilling) can result in open-source (i.e., fugitive) dust and process-source dust (incl. radionuclides), which can accumulate and result in changes in soil quality of the stockpiled soil and organic matter/peat as described in Sections 9.1.4.2.2 and 9.1.4.2.3).</p>	Please clarify if COPC concentrations monitoring is planned to be performed for stockpiled soil and organic matter/peat.		Accepted	n/a
IR-137	-	ECCC	Migratory birds, Wildlife and Wildlife Habitat,	Section 9.2.1.3, Spatial and Temporal	<p><b>Context and Rationale:</b> The CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> Pursuant to the Canadian Environmental Assessment Act, 2012 states that: “The EIS will describe the spatial boundaries, including local and regional study areas, for</p>	Provide a biologically relevant rationale for the delineated study boundaries (LSA and RSA) for all different valued components. Include the following information:		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
			Vegetation and Wetlands	<p>Boundaries for Vegetation and Ecosystems, Listed Plant Species and Wetlands</p> <p>Section 9.3.1.3.1, Spatial Boundaries for Ungulates, Furbearers and Woodland Caribou</p> <p>9.4.1.3.1, Spatial Boundaries for Raptors, Migratory Breeding Birds, and Bird Species at Risk</p>	<p>each VC to be used to assess the potential adverse environmental effects of the Project and provide a rationale for each boundary.</p> <p>Spatial boundaries will be defined taking into account the appropriate scale and spatial extent of potential environmental effects, community knowledge and Indigenous knowledge, current or traditional land and resource use by Indigenous groups, ecological, technical, social and cultural considerations.”</p> <p>The information provided in the EIS does not enable a biologically relevant assessment of the Project’s effects.</p> <p>The Proponent did not provide rationale for the selection of study areas for individual vegetation, wildlife or migratory bird valued components (VC). Different VCs may have different spatial boundaries for the LSA and/or RSA. For wildlife and bird VCs, the LSA is defined as a 1.7-km buffer from the Project area, and the RSA is defined as a 6.6-km buffer around the LSA. There is no information on how the spatial boundaries were derived.</p> <p>Specific to Woodland Caribou, boreal population (hereafter referred to as boreal caribou):</p> <p><u>Project Footprint:</u> In a scientific assessment of critical habitat (Environment Canada, 2011) [1] ECCC demonstrated that the application of a 500-m buffer to mapped anthropogenic features best represents the combined effects of increased predation and avoidance on caribou population trends at the national scale. Adding a 500-m buffer to the Project footprint is required to represent functional habitat loss.</p> <p>The draft EIS does not appear to use a buffer for their Project area. The draft EIS (Section 9.3.1.3.1) states: “Project Area: the area within which the Project and all components/activities are located (i.e., the area of maximum physical disturbance). The Project Area covers 169.6 ha and is not VC-specific, but consistent throughout the EA.” (p. 9-168)</p> <p><u>LSA:</u> The defined LSA for boreal caribou has to consider avoidance of disturbed areas, predator access to undisturbed areas, reduction in connectivity and sensory disturbance. This required information is not detailed in the draft EIS.</p> <p>Adverse effects of Projects including predator and prey access to undisturbed areas, reduction in connectivity, and sensory disturbance to individual boreal caribou can vary and extend several kilometers depending on Project activities and ecological context. At minimum, the LSA should capture the above- mentioned effects. For boreal caribou, the Project footprint should be defined as the immediate area to be cleared, plus a 500-m buffer to represent functional habitat loss. Following this guidance, the LSA should be defined as a buffer of the Project footprint with the 500-m buffer.</p>	<ul style="list-style-type: none"><li>Descriptions of how the RSA and LSA boundaries were derived for all VCs.</li></ul> <p>Specific to boreal caribou:</p> <p><u>Project Footprint:</u></p> <ul style="list-style-type: none"><li>Include a 500-m buffer of area of maximum physical disturbance to represent functional habitat loss for boreal caribou</li></ul> <p><u>LSA:</u></p> <ul style="list-style-type: none"><li>Include a description of how the LSA takes into account boreal caribou avoidance of disturbed areas, predator access to undisturbed areas, reduction in connectivity and sensory disturbance to individuals.</li></ul> <p><u>RSA:</u></p> <ul style="list-style-type: none"><li>Include a description of how the RSA used in the draft EIS is an accurate representation of the SK1 boreal caribou range; <b>or</b></li><li>Re-do the assessment with the RSA at the scale of the range</li></ul> <p>See also related IRs: IR-154 and IR-156.</p>			

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>RSA: The Amended Recovery Strategy for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada states: <i>Mitigation of adverse effects from individual projects/activities will require a coordinated approach and management of cumulative effects within and among ranges. A cumulative effects assessment is essential to position the proposed project/activity in the context of all current and future development activities. The cumulative effects assessment will:</i></p> <ul style="list-style-type: none"><li>• <i>Assess the impact of all disturbances (anthropogenic and natural) at the range-scale;</i></li><li>• <i>Monitor habitat conditions, including the amount of current disturbed and undisturbed habitat, and amount of habitat being restored;</i></li><li>• <i>Account for planned disturbances; and</i></li><li>• <i>Assess the distribution of disturbance in large ranges for risk of range retraction in parts of the range.</i></li></ul> <p>The proposed Project’s cumulative effects for boreal caribou are possible at the scale of the SK1 boreal caribou range. The RSA used for boreal caribou for this Project is only 40,173.6 ha, compared to the SK1 range, which is 18,034,870 ha. As such, it is too small to capture cumulative effects to this species and does not follow the Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada (Environment Canada, 2011) or the Amended Recovery Strategy for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada.</p> <p><b>Reference:</b> [1] Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada (Environment Canada, 2011).</p>				
IR-138	-	CNSC	COPC in Lichen	Section 9.2.4.2.2  Appendix 10-A (ERA)	<p><b>Context:</b> A quantitative assessment using modelling dispersion and uptake of COPCs in the environment was completed for the Project as part of the ERA, to support conclusions drawn in the EIS. In Appendix 10-A (ERA), COPCs in plant tissue was estimated for lichen. Table 5-5 of the ERA (p. 5.24) named “Complete Exposure Pathways for All Selected Ecological Receptors to be Assessed using the IMPACT Model” lists the exposure pathway for lichen as direct contact on soil.</p> <p><b>Rationale:</b> Airborne COPC can deposition on lichen and subsequently enter the food chain; therefore, the “contact with air” pathway should be considered. In fact, lichen species are frequently used to monitor the deposition and accumulation of airborne contaminants (e.g., dust, metals). It is also noted that based on sampling results of the 2017 baseline studies, lichen frequently contain higher concentrations of COPC than blueberry (compare Table 9.2-6 and Table 9.2-7 in the EIS), especially at sampling sites with elevated concentrations (e.g., RSV9 and RSV10).</p>	<p>Please include the exposure pathway of direct deposition (dry and wet) of airborne contaminants on lichen in the quantitative ERA, or justify why this exposure pathway was not considered.</p> <p>See also related: IR-189.</p>		Accepted	n/a
IR-139	-	ECCC	Change to an environmental	Section 9.2.5.2.7, Waste and	<p><b>Context:</b> In this section, the Proponent outlines various measures to mitigate air emissions, including implementation of the air quality programs within the</p>	<p>Confirm if vehicles and equipment will be equipped with Tier 4 engines where feasible.</p>	<p>Response is accepted, but also see AD-55 in the Advice to Proponent table.</p>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
			component due to hazardous contaminants	Hazardous Materials Management	<p>Environmental Management System, regular maintenance and inspection of equipment, and elimination of unnecessary idling of equipment. However, the intention to use industry-standard emission control systems has not been substantiated.</p> <p><b>Rationale:</b> For the protection of air quality, it is important to specify the emission standards that equipment will have (e.g., Tier 3 or Tier 4 engines). Vehicles and equipment with Tier 4 engines have much lower emissions of contaminants than those with Tier 3 engines. If non-Tier 4 engines are used, ECCC recommends that best management practices are followed, including proper maintenance of the engine and anti-idling measures.</p>				
IR-140	-	CNSC	Change in the Areal Extent of Wetlands	Section 9.2.6.4	<p><b>Context:</b> Predicted residual effects on the areal extent of wetlands include the direct effect of loss of wetlands and several indirect effects of alteration of wetlands. As stated in the EIS, wetlands can exhibit low resilience and high susceptibility to disturbance. At the same time, wetlands tend to support a high species diversity, and are considered to have a moderate to high potential to support listed plant species. Lastly, wetlands are rare on the landscape compared to terrestrial ecosites (see Table 9.2-5).</p> <p><b>Rationale:</b> Several wetland ecosites (BS19/24, BS25, BS27) occur only in small areas (&lt; 30 ha) in the RSA but are predicted to experience disturbance of 6-64%, most notably the ecosite BS19/24 where 0.8 of 1.2 ha are predicted to be disturbed. It is noted that wetlands are scattered throughout the landscape as shown in Figure 9.2-8. More information is requested regarding the ecological impact of this disturbance.</p>	<p>1. Please provide a discussion on the ecological impact of disturbance to rare wetland ecosites.</p> <p>2. Please provide information on whether adequate other habitat is available for species impacted in these disturbed sites in close proximity, taking into account the home ranges of susceptible species.</p> <p>3. Please provide additional information on whether wetland connectivity is maintained through the landscape within the LSA/RSA.</p> <p>See also related: IR-141.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> CNSC recommends that Denison conduct monitoring of species present in wetlands before and after disturbance, with a focus on listed plant species.</p>		Accepted	n/a
IR-141	-	ECCC	Wetlands	Section 9.2.6.4.1	<p><b>Context and Rationale:</b> The Proponent states that: “Direct loss of wetlands has been mitigated by reducing the size of the Project Area to the extent practicable during Project design.</p> <p>However, up to 0.5 ha (less than 0.1%) of all wetlands within the Terrestrial RSA are anticipated to be removed from the Project Area during Construction (Table 9.2-16).”</p> <p>Information is not provided on whether wetlands in the terrestrial RSA are considered ecologically, economically or socially important to the region. Information on the regional importance of the wetlands that will be lost is needed in order to assess effects, including a wetland compensation plan if the wetlands are considered regionally important.</p>	<p>1. Provide information that accounts for whether wetlands are considered ecologically, economically and socially important to the region.</p> <p>2. If the above is affirmative provide a wetland compensation plan to offset the loss. Consistent with the Operational Framework For Use of Conservation Allowance [1] a minimum ratio of 2:1 should be the starting point when determining the amount to be offset.</p> <p>[1] Available at : <a href="https://publications.gc.ca/site/eng/9.696852/publication.html">https://publications.gc.ca/site/eng/9.696852/publication.html</a></p> <p>See also related: IR-138.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-142	-	ECCC  CNSC	Wildlife and Wildlife habitat	Section 9.3.3.2.1 Scientific Literature Review – Wolverine Section 9.3.5 Mitigation Measures Section 9.3.6 Residual Effects Evaluation	<p><b>Context:</b> The Proponent did not conduct any field work to identify potential wolverine dens in the Project area and therefore did not present any mitigations for the potential impacts to wolverine dens.</p> <p>In Section 9.3.3.2.1, the Proponent states: “Denning females are sensitive to disturbance during denning season in February to April and may abandon their dens and, in some cases, their litter, which may decrease their reproductive success. “</p> <p>In Section 9.3.6, the Proponent states: “In the Project Area, 145.0 ha or 100% of available wolverine habitat is assumed to be removed and will not be available to wolverine for the duration of the Project (Table 9.3-13). Similarly, 145.0 ha (3.4%) of available wolverine habitat within the Wildlife LSA is anticipated to be removed, all from the Project Area, during site clearing in Construction. In the Terrestrial RSA, up to 0.5% (145.0 ha; from the Project Area) of available wolverine habitat is anticipated to be removed during site clearing in Construction.”</p> <p>The residual effect assessment estimates that 8.2% of available wolverine habitat within the Terrestrial RSA may be altered or lost (Table 9.3-20).</p> <p><b>Rationale:</b> As Wolverine is a Species at Risk Act Schedule 1 listed species, effects need to be identified, avoided, lessened and monitored. Mitigations, such as setback distances, should be used to protect important habitat features, such as dens.</p> <p>Wolverine occupy large home ranges and, therefore, need vast tracts of undisturbed land to maintain viable populations. The species avoids most human footprint types and linear features.</p>	<ol style="list-style-type: none"><li>1. Please provide additional information on whether the lost and/or altered wolverine habitat overlaps with wolverine home ranges.</li><li>2. Describe any important wolverine habitat feature (i.e., dens) that may be lost as a result of the Project.</li><li>3. Assess the need for pre- construction/pre-clearing surveys to identify any wolverine denning sites.</li><li>4. Please provide additional information on whether the remaining, available, undisturbed wolverine habitat size is suitable to maintain populations.</li></ol>	<p>The information provided by the Proponent is complete, however, a follow up IR regarding survey methods for all pre-construction and pre-clearing surveys is required.</p> <p>See follow-up IR-142-159-167.</p>	Accepted	n/a
IR-142 IR-159 IR-167	IR-142-159-167-R1	ECCC	Wildlife and Wildlife Habitat	<p><b>Reference to EIS:</b> Section 9.3.3.3, Baseline Studies Section 9.3.5 Mitigation Measures</p> <p>IR 142, 159, and 167 Responses from Denison</p>	<p><b>Context:</b> The Proponent has committed to conduct pre-construction and pre-clearing surveys for multiple species, however the timing and methods for the surveys were not provided.</p> <p><b>Rationale:</b> Knowing the survey methodology for pre-construction and pre-clearing surveys across multiple species is important because the Proponent is intending to collect data so that ECCC can determine whether the methodology used to collect the data is appropriate and if the methodology would contribute to understanding cumulative effects and adaptive management. Understanding how timing has been considered and incorporated into the methodologies is required to understand how sensitive periods, such as nesting, breeding, foraging and migration, have been considered in the EIS. An understanding of the methodologies and how these sensitive periods are being considered is required to evaluate the effectiveness of mitigation strategies and adaptive management being developed by the Proponent for each species mentioned in IR-142, IR-159 and IR-167.</p>	Provide survey methodology and timing for all preconstruction and pre-clearing surveys, including avian and species at risk surveys (caribou, wolverine).	<p>The Proponent notes that they will use visual searches for several bird SAR. This includes Bank Swallow, Barn Swallow, Common Nighthawk, and Horned Grebe. While visual observations are an appropriate method for detecting Barn and Bank Swallow nests, it is not suitable for detecting Common Nighthawk. The province of Saskatchewan provides appropriate protocols for detection of <a href="#">Common Nighthawk</a>.</p> <p>The Proponent also notes that they will conduct call-playback or visual searches for Olive-sided Flycatcher and Short-eared Owl. While the call-playback surveys would be more likely to detect individuals in areas to be cleared, the visual searches are unlikely to be effective for these species. The Proponent should consider following the provincial detection survey protocols for <a href="#">Short-eared Owl</a> and <a href="#">Olive-Sided Flycatcher</a>.</p> <p><u>In order to resolve this IR, Denison are expected to:</u></p> <ol style="list-style-type: none"><li>1. Modify the Table in “Attachment IR-142, IR-159, IR-167-R1 (Round 3)” to incorporate appropriate protocols for detection of Common Nighthawk, Short-eared Owl, and Olive-Sided Flycatcher, as suggested by ECCC.</li><li>2. Incorporate the Table into the EIS documentation, e.g., Appendix 9-D.</li></ol>	Not Accepted	<p><b>Note: For the complete history of the FIRT’s comments and Denison’s responses to this IR, refer to Appendix A below. Any attachments and updated EIS sections associated with the IR response in this table are available in Appendix A.</b></p> <p>1. 									3. Existing commitment 9-3 has been updated and now reads (additions in <b>bold</b> ): “To adequately address potential effects, regardless of the wildlife, seasonal or species-specific sensitivities, pre-disturbance wildlife clearance surveys (i.e., not species-specific surveys) will be completed prior to any work commencing. Results of the wildlife clearance surveys will be used to inform the design and delineation/establishment of suitable setback distances (i.e., specific to species, habitat, life-cycle sensitivities), work delays and/or other species-specific mitigation measures at that location, with discussions with ENV as appropriate. <b>The details on the methodology of species-specific pre-clearance sweep protocols and timing are provided in the Appendix 9-D of the final EIS.</b> ”
IR-143	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.3.3, Baseline Studies	<p><b>Context and Rationale:</b> The baseline caribou data is insufficient to understand potential Project impacts to this species. Presence/absence detection was provided by camera traps, incidental observations, winter track and pellet survey.</p> <p>Additional information and analyses on caribou use of the landscape during all life stages of the Project area is required to assess impacts and to determine significance of impact from the Project to caribou.</p>	<p>Provide details on the baseline caribou data including:</p> <ul style="list-style-type: none"><li>• Revision of map 9.3-8 to include all observations, categorized by type, season and year (see also IR-145); and</li><li>• Description of seasonal use of the LSA, RSA and caribou range.</li><li>• Description of Project areas used by caribou.</li><li>• Description of future studies planned to assess habitat use by caribou. Include specific details on how many additional years of aerial surveys will be completed to assess the caribou baseline conditions.</li></ul>	See also AD-81 in the Advice to Proponent table.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
						Utilizing additional data noted above and specified in IR-145, explain how caribou use of the area could be affected by the Project throughout all seasons and life stages (e.g., calving, post-calving, rutting, wintering).  See also related: IR-152.			
IR-144	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.3.3, Baseline Studies – map 9.3-8	<b>Context and Rationale:</b> The mapping of caribou observations during baseline studies provided in Figure 9.3-8, “Caribou Sign Observations in the Wildlife Study Areas,” is insufficient to enable conclusions to be drawn. ECCC is not able to review the spatial aspect of caribou observations without a map of all available observations. Additional information is available, as stated in Section 9.3.3.3.3: <i>“A total of 200 observations were made between 2017 and 2019 and recorded as either caribou sign (i.e., tracks, pellets, and evidence of feeding activity based on ground feeding craters and arboreal feeding evidence) or photographs (collected through the wildlife camera study) to document caribou presence in the LSA and RSA. Most observations occurred in the Terrestrial RSA, with observations concentrated in the north and southeast portions.</i>  <i>Three observations occurred in the southeast portion of the Wildlife LSA, and no caribou sign was observed in the Project Area. Figure 9.3-8 provides an overview of some caribou sign observed during the baseline studies.”</i>	Update map 9.3-8 to show all caribou observations during baseline studies, broken down by type of observation (camera, incidental, pellet, track) and season/year when the observation was made. Include additional data from the Province of Saskatchewan (see also IR-145) to help characterize caribou use on a spatial map.	See also AD-81 in the Advice to Proponent table.	Accepted	n/a
IR-145	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.3.3, Woodland Caribou	<b>Context and Rationale:</b> The Proponent has not provided sufficient information on how caribou use the landscape, including identification of areas for different life stages of caribou (calving, post-calving, rutting and wintering).  The University of Saskatchewan published a report entitled Population and habitat ecology of boreal caribou and their predators in the Saskatchewan Boreal Shield. This report contains information on habitat types that are used during different life stages. Additionally, Appendix H of the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 20202 [1] details habitat characteristics required by boreal caribou to carry out life processes necessary for survival and recovery.  The scientific literature review (Section 9.3.3.3.1) on Woodland Caribou states: “While calving areas have not been documented within the SK1 range, it is recognized that caribou may use open fen and treed bog habitat types for calving during the spring/summer period. In Saskatchewan, caribou habitat used during the calving season in the SK2 range demonstrated a strong selection for treed muskegs, but avoidance of jack pine, mixed hardwood stands, and roads (Dyke 2008).”  ECCC is not able to verify the Proponent’s effects assessment without sufficient information on important habitat or biophysical attributes for caribou within the study areas.	1. Provide, based off existing literature or available data and the Amended Recovery Strategy for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada: <ul style="list-style-type: none"><li>information on known important habitat features or biophysical attributes in Project areas for different caribou life stages (calving, post-calving, rutting, wintering),</li><li>a map(s) of the type and spatial extent of important caribou habitat features or biophysical attributes of the study areas as defined in Appendix H of the Recovery Strategy,<ul style="list-style-type: none"><li>mapping should be at the RSA/LSA level as well as larger-scale mapping at the scale of the Project footprint.</li></ul></li></ul> 2. Assess the potential direct and indirect effects based on additional information on caribou from bullet A above.  See also related IRs: IR-143 and IR-152.  <b>Suggestions for mitigation and follow-up measures:</b> ECCC recommends that the Proponent contact the Province of		Accepted	n/a

					[1] <a href="https://www.canada.ca/en/environment-climate-change/services/species-risk-public-registry/recovery-strategies/woodland-caribou-boreal-2020.html#toc0">https://www.canada.ca/en/environment-climate-change/services/species-risk-public-registry/recovery-strategies/woodland-caribou-boreal-2020.html#toc0</a>	Saskatchewan to enquire about obtaining caribou telemetry data in the Project area. The data can be analyzed to determine important habitat features in the Project area.			
IR-143 IR-144	IR-143- 144-R1	ECCC	Wildlife and Wildlife Habitat	Section 9.3.3.3, Baseline Studies  IR-143 and 144 Responses from Denison	<p><b>Context:</b> In the IR-143 response, the Proponent states: “As described in the EIS, caribou may use open fen and treed bog habitat types for calving during the spring/summer period. Information from Indigenous Knowledge (IK) was included in the EIS, including potential calving areas in the Terrestrial RSA.” The Proponent provided a revised Map 9.3-8 to display these features.</p> <p><b>Rationale:</b> While the revised Map 9.3-8 shows seasonal use, it is challenging to see the overlapping spatial and temporal features. The map is not adequate for fully understanding the seasonality of the data. The scale provided does not allow for a proper assessment of seasonal use, including differentiation of habitat use such as calving, movement or wintering habitats.</p> <p>Some habitats, based on use, may be more used for more critical functions than others and this information cannot be adequately assessed based on the information provided.</p>	Provide individual maps by season and survey type or with larger scale insets that show areas with overlapping spatial and temporal features.		Accepted	n/a
IR-143 IR-145	IR-143- 145-R1	ECCC	Wildlife and Wildlife Habitat	Section 9.3.3.3, Baseline Studies  IR-143 and 145 Responses from Denison	<p><b>Context:</b> Information presented on boreal caribou in the study areas in the Proponent’s response is insufficient to:</p> <ul style="list-style-type: none"><li>• characterize and determine the risk of Project impacts,</li><li>• and</li><li>• calculate the appropriate level of offsetting required.</li></ul> <p>Information on important habitat features and how caribou are using the landscape is required to complete an assessment of the Project impacts.</p> <p>Although the Proponent provided a map showing telemetry points (provided by the Province of Saskatchewan), the map lacked sufficient detail to assess habitat use and important biophysical features of the Project area.</p> <p>The IR-145 response states: “Available habitat was determined as the ecosites in which caribou / caribou sign were detected most frequently during the baseline studies, and the EIS used a precautionary approach by assuming caribou use of these areas during all seasons and life stages.” As a part of the analysis, calving areas are particularly important to delineate if information is available as a key part of all life stages.</p> <p>In the draft EIS, the habitat types that are considered non-habitat for caribou are open bogs (BS20), leatherleaf shrubby fens (BS22), graminoid fens (BS24), open</p>	<p>1. Provide maps at the Project Development Area (PDA)/Local Study Area (LSA)/Regional Study Area (RSA) scale showing caribou habitat quality.</p> <p>2. Provide maps at the PDA/LSA/RSA scale showing areas with the appropriate biophysical attributes for calving and other life stages, such as important wintering habitats and movement corridors.</p> <p>Indicate the source of telemetry data (i.e., University of Saskatchewan and/or the Province of Saskatchewan).</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>fens (BS25), rush sandy shorelines (BS26), sedge sandy shorelines (BS27) and waterbodies.</p> <p><b>Rationale:</b> Woodland caribou are known to use treed bog and open fen (Section 9.3.3.3.1 of the draft EIS), however open fens and bogs are excluded from the identified available Woodland Caribou habitat, based on not detecting presence or not detecting presence as frequently.</p> <p>Mapping of important caribou habitat features is required to assess important potential impacts to caribou. In the absence of telemetry data, mapping of habitat quality, based on a combination of known ecosites and known important biophysical features will provide a reasonable alternative where known important caribou habitat features cannot be mapped.</p>				
IR-146	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.3.3.1, Woodland Caribou, Scientific Literature Review - Predation	<p><b>Context and Rationale:</b> The information on impacts of predation and apparent competition for caribou in relation to the proposed Project are insufficient.</p> <p>In the section on caribou predators (9.3.3.3.1), the Proponent provided details on densities of wolves and their overlap with caribou and speaks of apparent competition. The Proponent did not examine other predators, such as black bear.</p> <p>The analysis on impacts of predation and apparent competition is insufficient since known predators have been omitted without explanation from the assessment of effects. ECCC is not able to verify the Proponent’s effects assessment since important species have not been considered in the assessment.</p>	Provide further information and analyses on all potential predators of caribou, including impacts from apparent competition.		Accepted	n/a
IR-147	-	ECCC	SAR – Boreal Caribou	Section 9.3.4.2.1, Alteration and/or Loss of Habitat	<p><b>Context and Rationale:</b> The process of in-situ recovery mining will likely create changes to the surface topography and potential ground subsidence as well as changes to groundwater elevations. These changes can affect the plant communities and ecosite types.</p> <p>In Section 9.3.4.2.1 the Proponent states that: “Following decommissioning and reclamation, wildlife habitat is expected to recover to baseline conditions.”</p> <p>A more thorough explanation regarding post-decommissioning landscape is required to assess Project impacts.</p>	<p>1. Provide further rationale and/or analysis regarding the return of wildlife habitat to baseline conditions post-decommissioning. Incorporate other environmental impacts including:</p> <ul style="list-style-type: none"><li>Ground subsidence and impacts on wildlife habitat</li><li>Changes to aquifers and impacts on wildlife habitat</li></ul> <p>2. Describe reclamation activities/measures, including temporal information that will be implemented to help in the recovery to baseline conditions.</p>		Accepted	n/a
IR-148	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.4.2.1, Alteration and/or Loss of Habitat	<p><b>Context and Rationale:</b> ECCC analyzes disturbance for caribou at the range level, in this case within the SK1 range. However, the Proponent did not provide an adequate assessment of total disturbance at the range level. The draft EIS (Section 9.3.4.2.1 p. 9-211) reads: “The SK1 Boreal Shield Woodland Caribou Management Unit has relatively low levels of anthropogenic disturbance and was exposed to large fire disturbances in the past 40 years (ECCC 2019). Environment and Climate Change Canada (2019) identified this caribou population as being self-sustaining at a threshold of 40% undisturbed habitat with the total anthropogenic disturbance not exceeding 5% of their habitat. The current anthropogenic disturbance levels (without areas burnt by past forest fires) for the study areas are below this</p>	<p>Provide the following in order to support analysis of habitat disturbance:</p> <ol style="list-style-type: none"><li>Calculation of total disturbance including natural and anthropogenic disturbance at the range level.</li><li>Description of effects on existing habitat at the scale of the range (for &lt; 40% undisturbed habitat in the SK1). Include:<ul style="list-style-type: none"><li>an account (and GIS file if available) of existing habitat affected, using the following formula:</li></ul></li></ol>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>threshold (with the exception of the already disturbed Project Area) and are estimated as: 24.8 ha (14.6%) for the Project Area, 168 ha (3.5%) for the Wildlife LSA, and 599 ha (1.5%) for the Terrestrial RSA.”</p> <p>Analysis of habitat disturbance should be calculated at the range level in order to assess impacts and determine significance.</p> <p>Analysis should be consistent with the methodology described in the document Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada (Environment Canada, 2011) [1].</p> <p>[1]<a href="https://publications.gc.ca/site/eng/401605/publication.html">https://publications.gc.ca/site/eng/401605/publication.html</a>, p. 28/41</p>	<p>(Project footprint + 500m buffer) – overlapping (permanent alteration(s) + 500m buffer)</p> <p>3. A map of the SK1 range showing all disturbed and undisturbed habitat, including predicted disturbance (direct and indirect) resulting from the Project.</p> <p>4. Description of whether the Project is expected to compromise the ability of the range to be restored to the undisturbed habitat threshold, and provide a rationale for the conclusion.</p> <p>See also related: IR-154.</p>			
IR-149	-	ECCC CNSC	Wildlife and Wildlife habitat	Section 9.3.5.2, Additional Wildlife- specific Mitigation Measures	<p><b>Context:</b> The EIS describes that ongoing research is performed to inform the development of a Woodland Caribou Management Plan. This includes studies on the effectiveness of linear disruption features on predator/prey movements, and a field program for long-term reclamation planning. Moreover, it is stated that the Plan will include a detailed assessment of the need for habitat offsets.</p> <p>The draft EIS Section 9.3.5.2 states: “A wildlife monitoring plan and a Woodland Caribou Management Plan will be developed to address wildlife-specific mitigation measures based on proven and accepted mitigation following standard industry guidelines and BMPs. The plans will provide guidance to avoid or minimize potential adverse effects of the Project on wildlife and wildlife habitat, including monitoring and follow-up programs, as appropriate. It will be in place during all phases of the Project and will be subject to ongoing review and revision as required. If monitoring identifies a need for additional or revised mitigation measures, a process of adaptive management (as described in the plan) will be triggered.”</p> <p><b>Rationale:</b> The draft EIS does not present sufficient species-specific mitigation measures for boreal caribou. ECCC is not able to assess potential residual impacts to caribou without specific mitigations.</p> <p>Since the Woodland Caribou Management Plan is still under development, it is difficult to judge whether the measures will be adequate to mitigate and/or offset potential project effects on Woodland caribou and its critical habitat.</p>	<p>Provide the Woodland Caribou Management Plan, to demonstrate effective mitigation of potential project effects, along with wildlife-specific mitigation measures for review.</p> <p>The Plan should be informed by and consistent with the Boreal Caribou Recovery Strategy and demonstrate that avoidance and minimization measures will be applied to mitigate for predicted Project effects to boreal caribou and its critical habitat prior to considering offsetting measures. That is, the Plan should follow the mitigation hierarchy and information should be provided as outlined below:</p> <ol style="list-style-type: none"><li>1. AVOID: Describe all measures that will be taken to avoid effects to boreal caribou and avoid the destruction or alteration boreal caribou critical habitat.</li><li>2. MINIMIZE: Describe all measures that will be taken to minimize the effects to boreal caribou and minimize the destruction of boreal caribou critical habitat.</li><li>3. RESTORE ON-SITE: describe the measures that will be taken to restore disturbed areas of the Project, related to construction, operation and maintenance, on boreal caribou critical habitat, remaining after considering the avoidance and minimization measures.</li><li>4. Characterize the risk of the adverse effects that are likely to result from the Project on boreal caribou and its critical habitat after avoidance minimization, and onsite restoration measures have been considered.</li><li>5. OFFSET: Describe the measures that will be implemented outside the Designated Project area to mitigate adverse effects, destruction or alteration of boreal caribou critical habitat by the Designated Project during construction and operation.</li></ol>	<p>A path to resolution is still under discussion for this IR. Further guidance to Denison is forthcoming, and this table will be amended and posted to the Canadian Impact Assessment Registry, once provided.</p> <p>See also AD-83 and AD-85 in the Advice to Proponent table.</p>		

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
						<p>6. Characterize the risk of the adverse effects that are likely to result from the Project on boreal caribou and its critical habitat after avoidance, minimization, onsite restoration, and offset measures have been considered.</p> <p>Describe all relevant uncertainties on the effectiveness of the measures to address adverse effects on boreal caribou and the rationale for the selected measure, in light of the mitigation hierarchy.</p> <p>See also related IRs: IR-157.</p>			
IR-149	IR-149-R1A	ECCC	Wildlife and Wildlife Habitat	<p>Section 9.3.5.2, Additional Wildlife specific Mitigation Measures Proponent response to IR-149</p> <p>IR-149 Response by Denison</p>	<p><b>Context:</b> Much of the information presented in the Conceptual Caribou Management Plan is qualitative in nature and does not present specific details regarding a quantitative assessment of impacts following measures to avoid, minimize, and restore on-site and then assess residual effects and determine the offset required to counterbalance the remaining impacts. This is required to understand if offsetting is sufficient to address impacts to caribou. The Proponent also does not provide details on methods that will be used for pre- disturbance wildlife clearance surveys. ECCC is aware that that the Proponent will be participating in restoration trials as part of the ‘Developing Eco-restoration Together’ program.</p> <p><b>Rationale:</b> ECCC requires the quantitative details on the assessment of impacts to be included within the Conceptual Caribou Management Plan to adequately assess how the Proponent has applied the mitigation hierarchy. Details on the methods that will be used for pre- disturbance wildlife clearance surveys will also be required to verify that the Proponent has adequately considered how they have avoided, mitigated, or restored impacts to caribou.</p> <p>While ECCC understands that the Proponent will be participating in restoration trials as part of the ‘Developing Eco-restoration Together’ program, however, more clarity on the Proponent’s role in the program and the scope of the program is required. Details such as how the outcomes of these programs will result in mitigation measures and offsetting requirements and additional clarity on the scope of the program should also be provided so that ECCC can understand the objectives and deliverables of the program.</p>	<p>1. Provide a quantitative assessment of impacts following measures to avoid, minimize and restore on-site and then assess residual effects and determine the offset required to counterbalance the remaining impacts.</p> <p>2. Provide details on methods to be used for pre-disturbance wildlife clearance surveys.</p> <p>3. Provide details on the Proponent’s role in the Developing Eco-restoration Together program and how that work may be used in offsetting requirements.</p> <p>4. Provide the scope (i.e., quantitative habitat amount) of the Eco-restoration Together program.</p>	<p>A path to resolution is still under discussion for this IR. Further guidance to Denison is forthcoming, and this table will be amended and posted to the Canadian Impact Assessment Registry, once provided.</p> <p>See also AD-82 and AD-85 in the Advice to Proponent table.</p>		
IR-149	IR-149-R1B	ECCC	Wildlife and Wildlife Habitat	<p>Section 9.3.5.2, Additional Wildlife specific Mitigation Measures Proponent response to IR-149</p> <p>IR-149 Response by Denison</p>	<p><b>Context:</b> Section 4.2.2 of the Conceptual Caribou Mitigation plan states: “locating excessive noise generating activities such as the concrete batching operation as far away from sensitive wildlife locations as possible;”. However, no specific mitigation measures are mentioned for impacts to caribou due to noise generated from the Project air strip.</p> <p><b>Rationale:</b> Noise from the air traffic using the air strip will also generate excessive noise that can impact caribou. Additional information on the timing and frequency of air traffic, as well as specific mitigations related to impacts from air traffic,</p>	<p>1. Provide additional information on the timing and frequency of air traffic using the Project air strip.</p> <p>2. Provide specific mitigations related to impacts from air traffic, including mitigations related to frequency and timing of flights.</p>	<p>Following the supplementary submission provided on July 8<sup>th</sup>, 2024, as well as the commitment (ID 9-36) provided in version 2 of the Commitments Register (July 17, 2024), this IR is accepted for the purposes of the EA review. However, the following must be corrected in the final EIS submission package:</p> <ul style="list-style-type: none"><li>Update the caribou management framework (EIS Appendix 9-E) to reflect the additional information and proposed mitigation measures, in the final EIS submission package.</li></ul> <p>See also AD-78 and AD-85 in the Advice to Proponent table.</p>	Accepted	n/a

					<p>ranges, sensitive life stages including calving (e.g., location of calving sites). It should be noted that the English River First Nation have identified caribou calving areas in the vicinity of the Project footprint.</p> <p><b>Reference:</b> [1] Saskatchewan Ministry of Environment. 2013. Conservation Strategy For Boreal Woodland Caribou (Rangifer tarandus caribou) in Saskatchewan. Saskatchewan Ministry of Environment. Fish and Wildlife Technical Report 2014.</p>				
IR-153	-	CNSC	Woodland Caribou Residual Effects Evaluation	Section 9.3.6.4.1	<p><b>Context:</b> According to ECCC (2020), forest fires can directly alter habitat, making it unsuitable for boreal caribou (e.g., through loss of mature conifer stands, loss of lichens and other forage plants, barriers to movement). Boreal caribou generally do not return to burned areas for several decades until the forest is old enough to support lichens and other food sources, although they may make limited use of burned areas to feed on new growth.</p> <p>The residual effects evaluation of alteration and/or habitat loss lists ecosites BS3 and BS7 (regenerating forest types) as available habitat in Table 9.3-22, which represent 43.5% of the Regional Study Area.</p> <p><b>Rationale:</b> It is unclear whether the ecosites BS3 and BS7 (regenerating forest types) represent suitable habitat for Woodland caribou year-round. More information is required on the habitat quality (e.g., time since last forest fire) and suitability for different life stages of caribou.</p> <p>For conservatism, it is recommended to perform a second residual effect analysis not including regenerating forest ecosites.</p>	<p>1. Please provide further information on the suitability of ecosites BS3 and BS7 for Woodland caribou in different life stages.</p> <p>2. Please provide the results of a residual effect analysis not including ecosites BS3 and BS7 for conservatism.</p> <p>3. If 2 leads to habitat fragmentation, consider connectivity of habitat patches in the residual effect analysis.</p>		Accepted	n/a
IR-154	-	CNSC	Woodland Caribou Alteration and/or Loss of Habitat	Section 9.3.6.4.1	<p><b>Context:</b> Lichen, the primary food source for Woodland caribou (up to 70% of the year-round diet), can be exposed to airborne contaminants and dust deposition at distances of 1–40 km (e.g., increased metal concentrations or dust were detected in lichen at distances of 1–40 km from a mine site [1, 2]).</p> <p><b>Rationale:</b> Further information is requested on how the potential for contamination of the food source “lichen” is reflected in the applied buffers of direct and indirect disturbance for woodland caribou.</p> <p><b>References:</b> [1] Watkinson et al. (2021). Effects of dust deposition from diamond mining on subarctic plant communities and barren-ground caribou forage. Journal of Environmental Quality 50(4): 990-1003. Doi: 10.1002/jeq2.20251. [2] Chen et al. (2017). Does dust from arctic mines affect caribou forage? Journal of Environmental Protection 8(3): 258-276. Doi: 10.4236/jep.2017.83020.</p>	<p>1. Please provide additional justification for how the potential for contamination of the food source “lichen” is reflected in the applied buffers for sensory disturbance.</p> <p>See also related IRs: IR-137, IR-148 and IR-156.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> CNSC recommends the following:</p> <ul style="list-style-type: none"><li>• COPC in Lichen monitoring is recommended in transects from the Project site to assess COPC concentrations and confirm whether the chosen buffer is conservative.</li></ul>		Accepted	n/a
IR-155	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.6.4.1, Alteration and/or Loss of Habitat	<p><b>Context and Rationale:</b> In Section 9.3.6.4.1 of the draft EIS, the Proponent presents figure 9.3-14 and table 9.3-22, which “depicts available woodland caribou habitat in the Project study areas” and provide a summary of available Woodland Caribou</p>	<p>1. Provide a biologically relevant explanation about how available caribou habitat was determined or determine</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>Habitat in the Project Area, Wildlife Local Study Area, and the Terrestrial Regional Study Area.</p> <p>The Proponent does not provide a biologically relevant explanation on the ecosites that are considered available woodland caribou habitat.</p> <p>According to the amended recovery strategy for Caribou, all habitat within SK1 range has been designated as critical habitat. To align with best current knowledge and the amended recovery strategy, the map and table should show the biophysical attributes, as outlined in Appendix H of the recovery strategy.</p>	<p>available habitat based on new data from the province of Saskatchewan (See IR-145).</p> <p>2. Consider referencing Appendix H <a href="#">of the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020</a> to define important biophysical features.</p>			
IR-156	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.6.4.1 Section 9.3.7.3.1	<p><b>Context and Rationale:</b> In Section 9.3.6.4.1 of the draft EIS, the Proponent identified that 142 ha of available caribou habitat within the Project footprint will be directly impacted or lost, while an additional 1,165 ha will be indirectly impacted by Project activities such as sensory disturbance. They assessed the residual and cumulative effect of alteration to habitat for woodland caribou as not significant: “The residual effect of alteration and/or loss of available woodland caribou habitat is not expected to result in a change that will alter caribou habitat integrity to the point where it would not be able to sustain the regional woodland caribou population. Therefore, the effect is assessed as not significant.”</p> <p>Section 9.3.7.3.1 of the draft EIS states: “It is not expected that the cumulative effects of alteration and/or loss of habitat will alter the integrity of woodland caribou habitat within the Terrestrial RSA to the point where it is not sustainable or available to contribute to ecological functions. Therefore, the cumulative effects resulting from the Project’s residual effect interacting with residual effects from other projects and activities is predicted to be not significant.”</p> <p>For the residual effect of alteration and/or loss of available caribou habitat (Section 9.3.6.4.1, Table 9.3-24), the Proponent assessed the magnitude as low, the geographic extent as local, the duration as long-term, the frequency as frequent, the reversibility as fully reversible, the context as high and the likelihood as likely. The rationale provided by the Proponent is insufficient to determine the accuracy of these assessments, given the lack of data and the small size of the assessment area. ECCC does not support the residual effects assessment of low magnitude, given the uncertainties related to seasonal use by caribou in the Project area and the current level of disturbance in the SK1 range.</p> <p>For the cumulative effect of alteration and/or loss of available caribou habitat (Section 9.3.7.3.3 , Table 9.3-30), the Proponent assessed the magnitude as moderate, the geographic extent as beyond the RSA, the duration as long-term, the frequency as frequent, the reversibility as fully reversible, the context as high, the likelihood as likely, the significance as not significant and the level of confidence as moderate. The rationale provided by the Proponent is insufficient to determine the accuracy of these assessments, given the lack to data presented for caribou and the small size of the RSA, compared to the SK1 region. ECCC does not support the conclusion of the cumulative effects assessments or for the level of confidence.</p>	<p>Provide a revised assessment of residual and cumulative effects, taking into consideration that the disturbance within the SK1 range is above the disturbance management threshold required for survival and recovery of the species.</p> <p>See also related IRs: IR-137 and IR-154.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					The Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020 states that the range is currently at the 60% disturbance management threshold. Therefore, any activity likely to result in the alteration or destruction of critical habitat may impact on the species survival and recovery. In addition, the Proponent’s assessment was based on information that was lacking data on calving, wintering and rutting areas, and connectivity and caribou movements. The absence of considerations of the regional context of disturbance does not provide a conclusion based on best available information.				
IR-157	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.9 Ungulates, Furbearer and Woodland Caribou Summary	<p><b>Context and Rationale:</b> The Proponent has committed to developing a Woodland Caribou Management Plan, which will include a “detailed assessment for the need for habitat offsets.” The Woodland Caribou Management Plan will support ECCC’s review of the Proponent’s assessment of residual effects following mitigation and offsetting.</p> <p>This plan should consider ECCC’s Operational Framework for Use of Conservation Allowances (ECCC, 2012). ECCC is available to assist the Proponent in the determination of appropriate offsets that would balance against Project adverse effects after the application of measures to avoid, minimize and restore on-site are adopted.</p> <p>Based on the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020, anthropogenic impacts to local caribou populations experience a lag effect, which occurs over extended periods. This lag effect needs to be adequately considered when proposing offsets. ECCC is available to assist the Proponent in understanding how critical habitat is described in the Recovery Strategy and the determination of appropriate offsets that would balance against Project effects based on the predicted impacts to caribou habitat.</p>	<p>Provide the Woodland Caribou Management Plan for review. The plan should clearly demonstrate efforts to avoid and minimize any Project effects and restore on-site any disturbed areas prior to the consideration of offsetting. Details on how severity of disturbance and vulnerability of the species were considered should be explained.</p> <p>See also related: IR-149.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> ECCC notes that the Woodland Caribou Management Plan should clearly explain efforts to address Project effects, including any contribution to cumulative adverse effects, after it has been determined that all options in the previous steps of the mitigation hierarchy (i.e., avoidance, and minimization,) have been fully considered and applied.</p> <p>In the Woodland Caribou Management Plan, provide details on how the factors outlined in the Operational Framework for Use of Conservation Allowances (ECCC, 2012) were considered in determining the offsetting amounts, including the severity of disturbance and vulnerability of the caribou population. Important factors including time lag (the amount of time from restoration work to when the habitat would be considered caribou habitat) would also need to be considered.</p> <p>ECCC typically recommends a minimum offset multiplier of 4:1 (offset outcome: area disturbed). This is a benchmark ratio applied to a project that is in the lower end of the risk spectrum, such as one with a low severity impact adversely affecting a low vulnerability ecological component. In general, the minimum 4:1 multiplier accounts for time-lags to restoration, uncertainty in outcomes, a precautionary approach, and the adverse impact itself in its specific context. Offset multipliers are variable and determined by project-specific circumstances and associated risks and uncertainties.</p>	<p>A path to resolution is still under discussion for this IR. Further guidance to Denison is forthcoming, and this table will be amended and posted to the Canadian Impact Assessment Registry, once provided.</p> <p>See also AD-85 in the Advice to Proponent table.</p>		

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-158	-	ECCC	Migratory birds	Section 9.4.1.2, Key Indicators and Measurable Parameters	<p><b>Context and Rationale:</b> In Section 9.4.1.2 the Proponent outlined key indicators for “Migratory Breeding Birds” which includes Waterbirds and Waterfowl, Upland Game Birds and Migratory Songbirds. These are broad categories, which do not allow for assessment of the variation in habitat requirements or ecology of individual species or guilds.</p> <p><b>Updated Rationale:</b> The Proponent should identify additional focal species that can serve as indicator species by representing anticipated impacts to a broader guild of species. Indicator species should be demonstrably sensitive to the potential effect of interest, and suitable for inferring effects on other species.</p> <p>Species may be grouped into guilds for assessment based on similarities in ecology or vulnerability to Project effects, such as species at elevated risk of collision with vehicle traffic.</p> <p>By identifying focal species or guilds for each key indicator species within the Migratory Breeding Birds Valued Components (VCs), ECCC would be able to accurately review the Proponent’s assessment of impacts and mitigation measures in order to assess the accuracy of the Proponent’s conclusions and provide expert advice on the mitigation measures.</p>	Identify focal species/guilds for each key indicator species within the Migratory Breeding Birds valued components. Provide an updated analysis of Project effects on migratory birds.	See also AD-79 in the Advice to Proponent table.	Accepted	n/a
IR-159	-	ECCC	Migratory birds	9.4.3.2.3 Baseline Studies – Migratory Songbirds  Appendix 9-B, Section 2.10.2, Results	<p><b>Context and Rationale:</b> Information presented in the draft EIS is insufficient to accurately predict Project impacts to breeding birds. The Proponent collected a single year of breeding songbird point counts and aerial waterfowl surveys (including avian species at risk). A single year of surveys in which birds may be unusually scarce or abundant could severely compromise interpretation of post-construction monitoring data.</p> <p>Additionally, data presented in the draft EIS is from 2017 and ECCC advises that more recent data is needed for a comprehensive baseline to verify Project impacts.</p> <p>Data from the Saskatchewan Conservation Data Centre (HABISask), the Saskatchewan Breeding Bird Atlas and the Boreal avian Modelling project contain information on avian densities and avian species at risk that could supplement field data.</p> <p>The national standard for major projects recommends a minimum of two years of field surveys to be provided, so that temporal variability can be considered when comparing post-construction against baseline records and other available data.</p> <p><b>Updated Rationale:</b> ECCC recommends that for major projects, a minimum of two years of field surveys should be provided so that temporal variability can be considered when comparing post-construction against baseline records and other available data. More recent data is needed due to landscape changes that may have occurred since 2017 as well as cumulative effects that have occurred in that time. Additionally, if there was an unusually high population density of birds in 2017 due to extraneous circumstances, Project effects may be attributed to a non-</p>	Supplement breeding bird point count data and aerial waterfowl data collected during 2017 with additional pre-construction field data or existing post-2017 data/modelling to provide a comprehensive baseline that can be used to verify Project impacts during construction and operational phases.	See also AD-80 in the Advice to Proponent table.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>existent decline in the population when the discrepancy can be due to natural variability.</p> <p>A more recent baseline will account for interannual variation and any regional effects and will allow for a more accurate review of mitigation and follow-up measures. Data from the Saskatchewan Conservation Data Centre (HABISask), the Saskatchewan Breeding Bird Atlas and the Boreal Avian Modelling project contain information on avian densities and avian species at risk that could supplement field data.</p>				
IR-160	-	ECCC	Migratory birds	Section 9.4.3.2.3 Baseline Studies – Migratory Songbirds	<p><b>Context and Rationale:</b> ECCC advises that the results of the field studies need to be interpreted/analyzed in the context of the study area. The Proponent presents results on areas with highest richness and diversity but does not make a link to habitat that will be lost or experience indirect effects.</p> <p><b>Updated Rationale:</b> Results regarding the effects of the Project, including a discussion on habitat types that will be lost or indirectly impacted during the life of the Project, and a discussion on the overall impact on the avian community including results from baseline studies as well as other supplemental information as per IR-159 are required to assess the validity of the Proponent’s conclusions and should be used in effects assessment.</p>	<p>Provide results interpreted in the context of Project direct and indirect effects. Include discussion on the habitat types that will be lost or indirectly impacted during the Project and the overall impact on the avian community, using results from the analysis of baseline studies and other supplemental data (as per IR-159).</p> <p>Discussion should support the conclusions of the effects assessment.</p> <p>See also related IRs: IR-161 and IR-162.</p>		Accepted	n/a
IR-161	-	CNSC	Bird Species at Risk	Section 9.4.3.3  Appendix 10-A (ERA)	<p><b>Context:</b> For the assessment of effects on Bird Species at Risk (SAR), in the EIS it was decided to use representative species for certain SAR birds:</p> <ul style="list-style-type: none"><li>Olive-sided Flycatcher and Common Nighthawk were selected to represent Barn Swallow.</li><li>Yellow Rail and Rusty Blackbird were selected as substitutes for Horned Grebe.</li></ul> <p>No further rationale is provided to demonstrate that the identified surrogate species are representative of the Barn Swallow and Horned Grebe in the EIS. For example, do they share a common diet?</p> <p>Moreover, in the residual effects assessment, limited discussion is provided on the conservatism of chosen suitable habitat types for both surrogate and represented species, in the calculation of habitat loss and alteration, as well as change in mortality. For example, how does habitat for Common Nighthawk and Barn Swallow overlap (do they use identical habitat types?) and how does this affect the calculation of habitat loss and alteration used to evaluate the magnitude of residual effect?</p> <p>Finally, in the ERA, Lesser Scaup is the surrogate for Horned Grebe. Yellow Rail is also represented by Lesser Scaup but Rusty Blackbird is represented by Olive-sided Flycatcher.</p> <p><b>Rationale:</b> It is unclear what criteria were applied to select surrogate species for Barn Swallow and Horned Grebe, and how the chosen surrogates relate to Barn</p>	<p>1. Please provide additional information to justify the selection of surrogate species for Barn Swallow and Horned Grebe in the EIS. This should include a description of the similarity of SAR and associated surrogate species and any relevant uncertainties.</p> <p>2. Please provide conservative estimates of habitat loss and alteration for the represented and not directly assessed species (Barn Swallow, Horned Grebe).</p> <p>3. Please provide clarity as to why different surrogate species are used for Horned Grebe between the EIS and ERA.</p> <p>See also related IRs: IR-160 and IR-162.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					Swallow and Horned Grebe in terms of habitat type and range, nesting, and feeding requirements etc.  There is also inconsistency with respect to the use of surrogate species for the Horned Grebe between the EIS and ERA supporting document.				
IR-162	-	ECCC	Migratory birds	Section 9.4.3.3, Bird Species at Risk	<p><b>Context and Rationale:</b> Not all avian species at risk present in the study area were included as Key Indicators in the avian species at risk (SAR) valued component (VC). Barn swallow and horned grebe were recorded in the study area, but not included as VCs. Additionally, bank swallow may inhabit the Project area. Impacts to Species at Risk Act Schedule 1 listed species need to be identified, avoided, lessened and monitored.</p> <p>In Section 9.4.3.3. the Proponent states: “It is acknowledged that the listed Barn Swallow (<i>Hirundo rustica</i>) and Horned Grebe (<i>Podiceps auratus</i>) could potentially occur in the Terrestrial RSA. Incidental observations occurred during the baseline studies (Appendix 9-B). To focus the effects assessment on a few key species (described in the following) it was decided to use Olive-sided Flycatcher and Common Nighthawk to represent Barn Swallow as well, and to use Yellow Rail and Rusty Blackbird as a substitute for Horned Grebe. Unlike Horned Grebe, Yellow Rail and Rusty Blackbird are also listed provincially.”</p> <p>Barn swallow, bank swallow and horned grebe may have different nesting habitat requirements than the representative species discussed in the draft EIS. An explanation of how differing species are representative of one another is required, or if an explanation cannot be provided, the species should be assessed individually.</p> <p><b>Updated Rationale:</b> The management plans for these three species demonstrate the variability in their habitat selection.</p> <p>The Management Plan for the Yellow Rail (<i>Coturnicops noveboracensis</i>) in Canada (Environment Canada, 2013) states “Yellow Rails inhabit shallow wetlands and other wet areas with grass-like vegetation. They breed in wetlands such as damp hay fields or meadows, floodplains, bogs, upper levels of estuaries, salt marshes (Bookhout 1995, Alvo and Robert 1999, COSEWIC 2009), shallow prairie wetlands, and wet montane meadows (Peabody 1922, Sherrington 1994, Popper and Stern 2000). “</p> <p>The Management Plan for the Rusty blackbird (<i>Euphagus carolinus</i>) in Canada (Environment Canada 2015), states: “Rusty Blackbirds tend to select breeding sites with a combination of freshwater bodies with shallow water and emergent vegetation for foraging that are adjacent to wetlands with conifers or tall shrubs with cover for nesting (Matsuoka et al. 2010a, Matsuoka et al. 2010b, Greenberg et al. 2011).”</p> <p>The Management Plan for the Horned Grebe (<i>Podiceps auritus</i>), Western population, in Canada (ECCC, 2022) states: “The Horned Grebe breeds in small</p>	<p>1. Explain how nesting habitat requirements of barn swallow is represented by common nighthawk and olive-sided flycatcher as a VC or assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>2. Explain how nesting habitat requirements of horned grebe are represented by yellow rail and rusty blackbird as a VC, or assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>3. Assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>See also related IRs: IR-160 and IR-161.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>(generally 0.5 to 2 ha, but ranging from 0.24 to 18.2 ha), shallow (at least 20 cm deep, but on average 40 cm), and usually fishless, perennial wetlands, but they can also nest on larger lakes with shallow edges and sufficient emergent vegetation. Breeding sites usually contain at least 40% open water with beds of emergent vegetation, such as sedges (<i>Carex</i> spp.), rushes (<i>Juncus</i> spp.) and cattails (<i>Typha</i> spp.) (Faaborg 1976, Kuczynski et al. 2012, Routhier 2012, Stedman 2018).”</p> <p>Due to differing habitat selection and use, ECCC recommends that each selected VC is given an individual assessment with specific mitigation measures. This will allow for a more accurate review of the chosen mitigation measures.</p>				
IR-163	-	ECCC	Migratory birds	Section 9.4.3.3.3, Baseline Studies – Avian species at risk VCs	<p><b>Context and Rationale:</b> The baseline studies and data analysis for species at risk (SAR) birds is insufficient to accurately predict Project effects.</p> <p>ECCC recommends the use of predictive modeling in relation to survey data and habitat attributes to produce distribution and density maps. Sites within the study area that support particularly high densities or diversity of an individual species, based on direct observation and, where appropriate, distribution or occupancy models, would greatly improve confidence in Project impact predictions.</p> <p>Additional information on specific habitat use or models of habitat used by SAR would facilitate a more complete analysis of Project effects.</p>	Provide additional information, including mapping/modelling of specific habitat requirements for each avian species at risk or provide a justification of models used in the draft EIS.		Accepted	n/a
IR-164	-	ECCC	Migratory birds	Section 9.4.4.2.1, Alteration and/or Loss of Habitat – Migratory Breeding Birds	<p><b>Context and Rationale:</b> The discussion on impacts to migratory songbirds presented by the Proponent is not sufficient to understand the impacts on various guilds of birds (e.g., aerial insectivores, forest birds, wetland birds, habitat specialists).</p> <p>As per IR-158, focal representative species/guilds should be used as key indicators (KI) in the Migratory Breeding Birds Valued Component. A greater level of detail on Project impacts to migratory songbirds with differing habitat requirements is needed for a fulsome assessment of effects.</p> <p><b>Updated Rationale:</b> A greater level of detail, including a discussion on impacts to different focal species and/or guilds within the Migratory Breeding Birds Valued Component, is required for a more fulsome assessment of effects and identification of mitigation measures. Additionally, mapping detailing important features or habitat types that will be lost due to the Project for different guilds of migratory birds will be required to assess Project effects. This information will be required in order for the Proponent to apply adaptive management, and for ECCC to review the adequacy of these management plans.</p>	<p>1. Provide further discussion on impacts to different focal species/guilds within the Migratory Breeding Birds Valued Component.</p> <p>2. Provide mapping of important features or habitat types that will be lost due to the Project for different guilds of migratory birds.</p>		Accepted	n/a
IR-165	-	CNSC  ECCC	Birds (all species)	Section 9.4.4.2.2  Section 9.4.5.2.4, Avian Deterrence and Prevention of Entrapment	<p><b>Context:</b> On p. 9-364 of the EIS, it is stated that exposure to hazardous materials through contact with contaminated waste ponds could affect avian health and contribute to mortality.</p> <p>However, the ERA places the avian receptors only in waterbodies and locations outside of the Project area (see Figure 5-2 in the ERA), i.e., Whitefish Lake, McGowan Lake, the inlet to Russell Lake, and Kratchkovsky Lake.</p>	<p>Please perform an ecological risk assessment with avian receptors located at the contaminated waste ponds, including:</p> <p>1. Describe and analyze the possibility of birds, species at risk and other wildlife using the water or waste management facilities and provide an analysis to determine if there is a risk to wildlife that may access these areas.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
				Appendix 10-A (ERA)	<p>Further, there are insufficient details on the potential effects of the water quality in the water management and treatment facilities on birds, species at risk, and other wildlife, including the risk of bioaccumulation of contaminants. The Proponent should assess potential effects of water quality from these areas using applicable CCME guidelines.</p> <p><b>Rationale:</b> It is unclear whether the ecological risk assessment based on the chosen exposure locations is protective and conservative for avian species potentially exposed to contaminated waste ponds on the Project site.</p> <p>While mitigation measures such as physical, visual, and/or auditory deterrents are proposed in Section 9.4.5.2.4, the possibility of avian species coming into contact with waste ponds cannot be excluded based on the available information in the EIS. The possibility of birds, species at risk, and other wildlife accessing the water management and treatment facilities for drinking water or other purposes is not discussed in the draft EIS.</p>	<p>2. Identify the potential toxicity of water management ponds to aquatic migratory birds and species at risk (SAR).</p> <p>3. Describe what measures will be taken if the waters are found to be toxic to migratory birds and SAR.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> CNSC recommends that Denison ensure adequate mitigation measures are implemented to minimize the potential for avian exposure to pond waters.</p>			
IR-166	-	ECCC	Migratory birds	Section 9.4.5.2 Additional Avian Species-specific Mitigation Measures	<p><b>Context and Rationale:</b> Avian species-specific mitigation measures are not presented in the draft EIS. The Proponent has committed to providing a variety of environmental management plans.</p> <p>Section 9.4.5.2 reads: “Additional mitigation measures specific to the Raptors, Migratory Breeding Birds, and Bird Species at Risk VCs, in accordance with the Migratory Birds Convention Act, and tailored to Project features will be incorporated into various Project management and monitoring plans such as the, erosion and sediment controls, soil and vegetation monitoring, wildlife monitoring, the Decommissioning Plan, air quality monitoring, Spill Response Plan, Radiation Protection Plan, surface water and effluent monitoring, and Waste Management Plan.”</p> <p>Migratory birds, the nests of migratory birds and/or their eggs can be inadvertently harmed or disturbed as a result of many activities, including but not limited to clearing trees and other vegetation, draining or flooding land, or using fishing gear; this is known as incidental take. This inadvertent harming, killing, disturbance or destruction of migratory birds, nests and eggs is prohibited under the MBCA. Incidental take, in addition to harming individual birds, nests or eggs, can have long-term consequences for migratory bird populations in Canada, especially through the cumulative effects of many different incidents. For further details, please refer to the Avoiding Harm to Migratory Birds website at: <a href="https://www.canada.ca/en/environment-climate-change/services/avoiding-harm-migratory-birds.html">https://www.canada.ca/en/environment-climate-change/services/avoiding-harm-migratory-birds.html</a></p> <p>In order to assess the effectiveness of species-specific mitigations and need for additional mitigations ECCC requires details on the species-specific mitigation measures proposed, and the monitoring plans.</p>	<p>Provide details on species-specific mitigations for species at risk (SAR) and other avian species that will include:</p> <ul style="list-style-type: none"><li>• details on what activity restrictions will be implemented for migratory birds and SAR and when they will be applied;</li><li>• details on mitigations used during regular maintenance activities such as vegetation management (e.g., mowing), access road repair (e.g., aggregate stockpiles), and infrastructure repair;</li><li>• details on methods used to detect species listed on Schedule 1 of the <i>Migratory Birds Convention Act</i> (e.g., Pileated Woodpecker) and mitigations/setback distances and timing to reduce risk to these species.</li></ul>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-167	-	ECCC	Migratory birds	Section 9.4.5.2.1 Work Timing Windows and Habitat Disturbance	<p><b>Context and Rationale:</b> The Proponent has stated that when it is not practicable to clear outside of the breeding bird window, they will conduct pre-clearing surveys. Section 9.4.5.2.1 states: “Prior to commencing any site clearing (i.e., vegetation clearing and/or soil disturbance) during the nesting season, pre-clearing nest surveys will be conducted at that location within the Project Area.”</p> <p>ECCC does not recommend the use of nest searches or pre-clearing surveys for active bird nests during the breeding season as a mitigation, given the difficulty associated with finding nests reliably and the high likelihood of disturbing nesting birds when searching. Instead, ECCC recommends that clearing and grubbing activities not be conducted during the breeding bird season.</p> <p>The Migratory Birds Regulations 2022 (MBR 2022) brings new scenarios that need to be considered:</p> <ol style="list-style-type: none"><li>Most migratory birds: - Nests are protected only when they are in use or when live eggs or chicks are present.</li><li>Migratory birds listed in MBR 2022 Schedule 1: - For the 18 species of migratory birds identified on Schedule 1, the MBR 2022 provide year-round nest protection until they can be deemed abandoned.</li><li>Migratory birds listed under SARA: - For some SARA listed migratory birds, the residence prohibition (s.33) will protect nests that are not active, but are re-used in subsequent years, and the critical habitat prohibition (s.58) will protect nests that are part of the critical habitat identification. Those prohibitions apply everywhere in Canada and at all times of the year. In these cases, a SARA permit will be required.</li></ol>	<p>Provide the following information:</p> <ul style="list-style-type: none"><li>details on how vegetation clearing related to site development will be conducted to minimize risk to migratory birds and species at risk (SAR).</li><li>the timing window that will be used for vegetation removal to reduce risk to migratory birds and SAR</li></ul>	Response is accepted, but also see AD-57 in the Advice to Proponent table and follow-up IR-142-159-167-R1.	Accepted	n/a
IR-168	-	ECCC	Migratory birds	Section 9.4.5.2.4, Avian Deterrence and Prevention of Entrapment	<p><b>Context and Rationale:</b> The Proponent mentions that avian deterrents will be used on power transmission lines, buildings and other Project infrastructure. However, the Proponent does not mention any deterrents that will be used for deterring birds from the water or waste management facilities.</p> <p>Details on deterrents for all Project components should be identified to assess residual and cumulative impacts to migratory birds.</p>	<p>Provide information on avian deterrents to be used to prevent birds or other wildlife entering water or waste management ponds.</p> <p>2. Explain how proposed timing of use of deterrents will reduce risk of migratory birds making contact with treatment waters outside of the nesting season (i.e., during migration and stop overuse).</p> <p>3. Explain which deterrents will be used, which deterrents were considered, and what alternative, adaptive measures will be considered if deterrents are unsuccessful for any Project components.</p>		Accepted	n/a
IR-169	-	ECCC	Migratory birds	Section 9.4.6.3, Residual Effects Evaluation for Migratory Birds,	<p><b>Context and Rationale:</b> The analysis of available habitat types for migratory songbirds appears incorrect.</p> <p>In their interpreted ecosite mapping, the Proponent identified 25 different ecosite</p>	<p>1. Explain how information in Table 9.4-15 and map 9.4-11 were derived.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
				Table 9.4-15 and Map 9.4-11	<p>types. In their table 9.4-15 and map 9.4-11, the Proponent only lists 8 ecosite types that are available migratory songbird habitat. Section 9.4.6 Residual Effects Evaluation for Migratory Songbirds reads: “Considering the baseline data (Appendix 9-B), migratory songbird habitat is described in the following text without species-specific differentiation and referred to as available habitat for migratory songbirds. Based on the baseline study results, 66.8%, 52.2%, and 50.7% of the Project Area, Wildlife LSA, and Terrestrial RSA, respectively, are assumed to provide available habitat for migratory songbirds (Table 9.4-15).”</p> <p>All Project areas, except some anthropogenic features and open water, would be considered available habitat for migratory songbirds. Although some ecosite types may have lower density and diversity, it is expected that all ecosites provide migratory songbird habitat.</p>	2. Explain why other habitat types were not considered as available habitat for migratory songbirds.			
IR-170	-	ECCC	Migratory birds	Section 9.4.6.4, Residual Effects Evaluation for Bird SAR, Table 9.4-19	<p><b>Context and Rationale:</b> The table and map presented by the Proponent do not appear representative of all available habitat for common nighthawk (CONI). Although CONI do preferentially use open areas such as gravel (often an anthropogenic disturbance) and regenerating forest, as identified in the draft EIS, they also use rock outcrops that can be within forested areas. As this area lies within the pre- Cambrian shield, there are likely rock outcrops that are also available habitat.</p> <p>As aerial insectivores, CONI select nesting areas in close proximity to wetlands or lakes where there is abundant forage.</p> <p><b>Rationale:</b> Habitat requirements and preferences for all species at risk is required for developing effective mitigations and adaptive management.</p>	<p>1. Provide an updated table and map that considers all available habitat for common nighthawk.</p> <p>2. Additionally, as part of environmental management plans the Proponent should include species-specific mitigations that are biologically relevant to all the species at risk for all Project phases and components.</p>	<p>Following the supplementary information provided by Denison on July 8<sup>th</sup>, CNSC staff determined that Denison has not provided the requested information on species-specific mitigation measures for each SAR.</p> <p>It is not adequate to group SAR together (e.g., all birds) due to the unique life history and habitat requirements of each individual SAR. Denison is expected to provide species-specific mitigation measures for each SAR separately.</p> <p><u>In order to resolve this IR, Denison are expected to:</u></p> <ul style="list-style-type: none"><li>Provide species-specific mitigation measures for each individual SAR. Denison may provide this information through revision of Section 3.3 and Table 4.1 in EIS Appendix 9-D.</li></ul> <p>See also AD-77 in the Advice to Proponent table.</p>	Not Accepted	<p><b>Note: For the complete history of the FIRT’s comments and Denison’s responses to this IR, refer to Appendix A below. Any attachments and updated EIS sections associated with the IR response in this table are available in Appendix A.</b></p> <p>The requested updates have been made in Appendix 9-D of the final EIS (October 2024) which has been included here in Appendix A (refer to response to IR-142-159-167-R1).</p>
IR-171	-	ECCC	Migratory birds	Section 9.4.6.4, Residual Effects Evaluation	<p><b>Context and Rationale:</b> Section 9.4.6.4 Residual Effects Evaluation for Bird SAR – Common Nighthawk reads: “Progressive reclamation is anticipated to begin during Construction. However, a conservative approach is used, with Common Nighthawk (CONI) habitat in the Project Area considered to be unavailable for the duration of the Project, only becoming available as habitat following Post-Decommissioning (i.e., during the regeneration of vegetation following Decommissioning).”</p> <p>CONI may nest on the roadsides of access roads within the Project area. As such, the Project area should still be considered available habitat for the duration of the Project and appropriate mitigations and adaptive management should be discussed for this species.</p>	Develop mitigation plans appropriate for avoiding collisions of common nighthawks with vehicles, when and where nighthawks are observed foraging near or roosting on gravel roads. Demonstrate how the planned mitigation activities will result in reduced residual effects from this pathway.		Accepted	n/a
IR-172	-	CNSC	Birds (all species)	Section 9.4.6.4.2	<p><b>Context:</b> Populations of listed species may be less resilient to changes in mortality.</p> <p>CSA N288.6:22 Clause 7.2.4.3 states that effects on a few individuals of endangered, threatened, or vulnerable species would not be acceptable.</p>	Please provide a discussion on mitigation measures with respect to their effectiveness in minimizing mortality for bird species at risk, for which effects on a few individuals would not be acceptable.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>The residual effects assessment for “Change in Mortality” for bird species at risk states that Project mitigation measures identified in Section 9.4.5 are expected to limit interactions between bird species at risk and potential sources of direct and indirect mortality. However, the mitigation measures are not discussed with respect to their effectiveness to limit interactions, specifically for bird species at risk.</p> <p><b>Rationale:</b> It is unclear if the proposed mitigation measures are effective in preventing mortality in bird species at risk for which even only a few deaths could negatively impact the population.</p>				
IR-173	-	ECCC	Migratory birds	Section 9.4.8 Monitoring and Follow-up	<p><b>Context and Rationale:</b> Monitoring and follow up programs are part of adaptive management and implementation of additional mitigations.</p> <p>In Section 9.4.8 the Proponent states: “Considering the Project planning, baseline survey results, and proposed mitigation measures, no follow-up programs are considered to be warranted at this time.”</p> <p>Project impacts related to mortality of birds, such as collisions with the transmission line, mortality along roads and use of waste and water management facilities should be monitored during all phases of the Project and adaptively managed.</p>	<p>Provide details on the follow-up program to monitor impacts to avian mortality. The follow-up plan should include:</p> <ul style="list-style-type: none"><li>• Monitoring of avian use of waste and water facilities</li><li>• Monitoring of mortality along access roads</li><li>• Monitoring of mortality related to transmission lines</li><li>• Monitoring of effectiveness of avian deterrents.</li></ul>		Accepted	n/a
IR-174	-	ECCC	SAR – Bats	Appendix 9-B, Denison Mines Corporation Wheeler River Project, Terrestrial Environment, Wildlife and Vegetation Baseline Inventory, Section 2.1.4 Acoustic Bat Surveys	<p><b>Context:</b> The Proponent conducted acoustic surveys for bats and confirmed presence of two Species at Risk Act (SARA) schedule 1 listed bat species in the Project area, little brown myotis (<i>Myotis lucifugus</i>) and northern myotis (<i>Myotis septentrionalis</i>). However, the Proponent did not do an effects assessment of either of these bat species.</p> <p><b>Rationale:</b> Although bats are present in the study area, no work was done to identify hibernaculum or maternal roosting sites. All species at risk that are expected to be present in the Project area should be assessed and species-specific mitigations detailed.</p>	<p>1. Conduct an effects assessment for little brown myotis and northern myotis, including the likelihood that tree clearing during the bat roosting period, is likely to ‘kill’, ‘harm’, or ‘harass’ Little Brown Myotis and Northern Myotis and its ability to carry out its life processes.</p> <p>2. Describe and map locations of suitable myotis hibernacula and/or maternal roost habitat within the Local Study Area and Regional Study Area and explain how these habitats may be affected by Project activities.</p> <p>3. Describe what mitigation measures will be taken to avoid the breeding period for bats.</p> <p>4. Describe any pre-construction/pre- clearing surveys will be conducted to identify any hibernaculum and maternal roosting sites. Describe how monitoring will support adaptive management.</p>	<p>A path to resolution is still under discussion for this IR. Further guidance to Denison is forthcoming, and this table will be amended and posted to the Canadian Impact Assessment Registry, once provided.</p>		<p><b>Note: For the complete history of the FIRT’s comments and Denison’s responses to this IR, refer to Appendix A below. Any attachments associated with the IR response in this table are available in Appendix A.</b></p> <p><b>Denison recognizes this IR is under discussion and have provided the following response IR-174 received in September 2024.</b></p> <p>1. The frequency of detections was on a 5 minute interval. This has been clarified in Figure 2-9 of Appendix 9-F (see Appendix A). We can confirm the turquoise dots represent passes or buzzes that were uncertain (unable to distinguish echolocation call</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									<p>characteristics between bat species) in all cases.</p> <p>2. See <b>Attachment IR-174 (Round 4)</b> in Appendix A for the response to this IR along with supporting maps.</p> <p>3. Methods for future pre-construction baseline bat surveys will build on the 2019 baseline (refer to EIS Appendix 9-B) and methods from the 2019 baseline are provided below along with information on how comparisons within year and between years will be completed.</p> <p><i>Methods</i></p> <p>Surveys will be commenced one half hour after sunset and ended one half hour before sunrise. Survey stations will be established 500 m apart along linear features where safe night travel was possible.</p> <p>Surveys will only be completed during appropriate weather conditions, with weather attributes (temperature, sky condition and wind (Beaufort scale)) recorded throughout the survey.</p> <p>Each survey site consists of a five-minute listening period using a Wildlife Acoustics Echo Meter Touch 2 Pro. The detector will be held with the microphone at a 45 degree angle and slowly rotated 360 degrees for the duration of the sampling period. If a bat is detected the detector is held</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									<p>stationary for 15 seconds to avoid duplicate counts.</p> <p>Total detector hours will be calculated for the Project area and by ecosite/vegetation cover type. Ecosite/vegetation cover type for each survey point is established by utilizing the dominate ecosite/vegetation cover type within a 50 m radius of the survey point.</p> <p><i>Acoustic Bat Call Analysis</i></p> <p>Data will be analyzed using Wildlife Acoustics Kaleidoscope software. Echolocation call characteristics will be used to identify bat species. Call characteristics used to establish species included: minimum frequency maximum frequency call duration call slope call shape</p> <p>Call characteristics will be compared to reference calls in literature and call libraries (WDNR 2016, WNDD 2016, Keinath 2011, Adams 2003). In addition, reference calls within Omnia’s call library will be used where possible.</p> <p>For future monitoring of bat species Denison will continue to inventory bat presence at given sites and this data will be analyzed to characterize:</p> <ul style="list-style-type: none"><li>• Presence (occupancy)</li></ul>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									<ul style="list-style-type: none"><li>• Relative abundance</li><li>• Change metrics to be analyzed include:<ul style="list-style-type: none"><li>○ Annual and total change at specific site</li><li>○ Annual and total change across all sites</li></ul></li></ul> <p>The analysis will be done using mean and 95% credible interval bars and will include covariates such as time of year (date), precipitation, temperature, forest cover, Ecosite and proximity to water/wetland. Appropriate statistical methods to compare pre-construction baseline and 2019 baseline data spatially and temporally will be employed and accompanied by power analysis.</p> <p>Results of acoustic bat surveys will be submitted to Saskatchewan’s Conservation Data Centre.</p> <p>4. Commitment 9-37 has been updated in version 3 of Denison’s commitment register (additions in bold) and now reads: <b>“Pre-construction baseline</b> acoustic bat surveys will be completed prior to construction, building on the 2019 surveys (Appendix 9-B). The surveys will determine the presence/non-absence, diversity and relative</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
									abundance of bat species in the Project Area. <b>Results of acoustic bat surveys will be submitted to Saskatchewan’s Conservation Data Centre.”</b>
IR-175	-	CNSC	Provincially Listed Species	Appendix 9-B; section 2.2.2	<p><b>Context:</b> Vegetation and wildlife habitat characterization field surveys were completed in 2017, based on which ecosite factsheets were prepared. The factsheets list observations of two provincially listed plant species with a rank of S3 (vulnerable/rare to uncommon; Table 2.4-2) according to the Saskatchewan Conservation Data Centre, which are not discussed in the main EIS document:</p> <ul style="list-style-type: none"><li>Angle-leaved sundew (<i>Drosera anglica</i>) observed in ecosites BS19, BS20, BS22, BS25</li><li>Neat Spike-rush (<i>Eleocharis nitida</i>) observed in ecosite BS25</li></ul> <p>Table 9.2-12 in section 9.2.6.2.1 of the EIS indicates that there may be indirect disturbance to some of these ecosites (BS19, BS20, BS25). In section 9.2.6.3.1 it is discussed that listed plant species are not likely to return once lost from a specific location.</p> <p><b>Rationale:</b> Given that not all areas in the revised Project footprint were surveyed for listed plant species in baseline studies, there is uncertainty as to whether any species were missed, in particular those that have been observed in ecosites present in the LSA/RSA (e.g., <i>Drosera anglica</i> and <i>Eleocharis nitida</i>, see also Appendix 2 Table of Appendix 9-B). It should also be noted that rare plant surveys were completed in summer 2017 only (section 2.4.2 of Appendix 9-B), which may underestimate annual rare species that may be dormant in the seed bank in some years due to specific seed emergence requirements.</p> <p>It is acknowledged that the Proponent committed to pre-construction listed plant surveys targeted on ecosites encountered in the Project Area but not previously surveyed, as well as ecosites within the Project Area with high potential to support listed plants.</p> <p>More information is requested on the potential indirect effects on rare plant species as well as the planned pre-construction surveys.</p>	<p>1. Please provide a discussion on the potential risks from indirect effects on ecosites with observed rare plant species</p> <p>2. Please provide additional information on the ecosites included in the planned pre-construction listed plant surveys</p> <p><b>Suggestions for mitigation and follow-up measures:</b> CNSC recommends focusing monitoring on ecosites that have known observations of listed plant species outside of the Project Area (e.g., BS19, BS20, BS22, BS25).</p>		Accepted	n/a
IR-176	-	CNSC	Human Health with respect to radiation exposure	Section 10.1.4.2.1 Section 10.1.6.1.4  Appendix 10-A (ERA)	<p><b>Context:</b> In section 10.1.4.2.1, the Proponent provides an evaluation of air quality constituents of potential concern to human health. It states: “A screening value for radon gas of 200 becquerels per cubic metre (Bq/m3) was available from Health Canada, which applies to total radon including background sources (Health Canada 2009). The radon concentrations which were predicted are incremental concentrations (i.e., above background) and were therefore compared to the applicable incremental screening value of 60 Bq/m3 for indoor air established by the Canadian Nuclear Safety Commission (CNSC) (Health Canada 2010a; Radiation Protection Regulations. SOR/2000-203).”</p> <p>The 60 Bq/m3 radon concentration value also appears in section 7.1.2 of Appendix</p>	<p>The EIS and appendices should be aligned with the Radiation Protection Regulations by:</p> <ol style="list-style-type: none"><li>Removing the reference to a 60 Bq/m3 limit.</li><li>Reporting the assessment results as the total dose, from all radionuclides combined including radon progeny, and by comparing this annual effective dose to the effective dose limit.</li></ol> <p>Provide a summary of the conservative assumptions that have been included in the dose calculations.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>10-A (ERA).</p> <p>Further in section 10.1.6.1.4, it is stated: “Radon dose was calculated separately from the dose due to other radionuclides; however, the predicted radon concentration was compared against the CNSC incremental concentration limit of 60 Bq/m3.”</p> <p>The Radiation Protection Regulations do not stipulate a limit for radon above background for sites Licensed by the CNSC. The effective dose limits for Nuclear Energy Workers (NEWs) and persons that are not NEWs are listed in section 13 of these regulations, and in subsection 1(3) of these regulations for the general public.</p> <p>The annual effective dose from all sources associated with the Licensed activities and within the scope of the Nuclear Safety Control Act and Regulations must be compared to the applicable effective dose limit. For members of the public this limit is 1 mSv per calendar year.</p> <p>In Section 4.2.5.3 of Appendix 10-A (ERA), there appears to be no reference mentioned for the radon equilibrium factors. These factors are a significant input into the dose calculations for radon.</p> <p><b>Rationale:</b> The reason for the requested change is to ensure consistency with the Radiation Protection Regulations.</p>	Provide a reference that shows how the radon equilibrium factors were determined.			
IR-177	-	HC	Change to an environmental component due to radiological contaminants	<p>Section 10.1.4.2.1 (p. 10-22)</p> <p>Appendix 10-A (ERA) : Appendix B Table B.9, Ref. 19-2638</p> <p>Section 6, Table 6.1-1 (p. 6-7)</p>	<p><b>Context:</b> Section 10.1.4.2.1 states that, “Screening values for radionuclide concentrations in ambient air were not available. All relevant radionuclides were assessed in the HHRA in terms of their contribution to the total radiological dose to human and ecological receptors” (p. 10-22).</p> <p>Section 10 Appendix 10-A (ERA) states that, “No formal screening was conducted for radionuclides. However, since radiation dose to human receptors is of public and regulatory interest, the radionuclides in the uranium-238 decay series are carried forward as COPCs for further assessment” (Appendix 10-A (ERA): Appendix B Ref. 19-2638).</p> <p>Table 6.1-1 lists radionuclides as a key indicator for air quality, but only uranium and radon are considered in Section 6, and Section 10 Table B.9 does not include doses from uranium progeny in air.</p> <p><b>Rationale:</b> Health Canada recommends using screening values that are available for radionuclides if they are appropriate for the dose and if the screening values have listed assumptions (such as particulate size and worker exposure time that can be adapted to in Denison’s models). Two examples are ICRP 96, which CNSC uses in their regulatory reports to derive reference air quality values for Pb-210, Ra-226, and Th-230 (CNSC: Regulatory Oversight Report for Uranium Mines and Mills in Canada 2019); and Health Canada’s Guidelines for Management of NORM (Health</p>	<p>1. Assess predicted radionuclides in Section 10 Appendix 10-A (ERA) using appropriate available screening values. Alternatively, provide a justification for why a screening wasn’t conducted for radionuclides despite the availability of screening values (e.g., ICRP 96 and NORM Guidelines, 2011).</p> <p>2. Clarify if uranium progenies in air are considered in the atmospheric transport and air quality modelling and are simply not reported, or if they are not included in the models because no screening criteria are available.</p>	Response is accepted, but also see AD-55 in the Advice to Proponent table.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					Canada: Canadian Guidelines for the Management of Naturally Occurring Radioactive Materials, 2011).				
IR-178	-	HC	Change to an environmental component due to hazardous contaminants	Section 10.1.4.2.1 (p. 10-22)  Section 6.1.4.2, Potential Project Related Effects (p. 6-31)	<p>The Baseline + Project scenario was not provided for radon levels.</p> <p><b>Context:</b> Section 6.1.4.2 states that the predicted levels for radon were not added to the respective baseline air quality levels (p. 6-31), and further explains that “In all modelled phases of the Project, annual average radon concentrations at receptors beyond the Property Boundary are expected to be indiscernible from background levels.”</p> <p>In Section 10.1.6.1.4, a different approach to evaluating predicted radon levels is mentioned: “the predicted radon concentration was compared against the CNSC incremental concentration limit of 60 BQ/m3“(p. 10-44).</p> <p><b>Rationale:</b> Without a rationale as to why baseline levels of radon were not included in the assessment, HC cannot fully evaluate the appropriateness of the air quality assessment. While Health Canada is of the opinion that using background radon levels as a screening value is appropriate in this case from a health perspective, different approaches to screening predicted radon levels in different sections appear to be used (i.e., background radon levels vs. CNSC incremental concentration).</p>	<p>1. Provide further information on whether and how baseline radon concentrations in air were determined.</p> <p>2. Include baseline radon concentrations in the predicted total concentrations when comparing to existing guidelines; alternatively, provide a rationale for why baseline concentrations of radon were not included.</p> <p>3. Discuss the potential health implications of the project-only increment-over-baseline radon levels</p>		Accepted	n/a
IR-179	-	CNSC	Groundwater quality decommissioning objectives.	Section 10.1.4.2.2, Release of Treated Effluent to Whitefish Lake During Decommissioning	<p><b>Context:</b> It is stated that “This process would continue until the recovered water meets acceptable groundwater quality decommissioning objectives”.</p> <p><b>Rationale:</b> The information provided does not include groundwater quality decommissioning objectives nor a reference to these objectives.</p>	Please provide groundwater quality decommissioning objectives or a reference to the information.		Accepted	n/a
IR-180	-	CNSC	Human health with respect to hazardous contaminants	Section 10.1.6.1.1, Human Receptors Selection and Characterization	<p><b>Context:</b> Within the Human Health assessment, offsite receptors during the operation period are only considered downstream of Whitefish Lake. The only identified concern was for Se to the Fisher/Trapper located at Russel Lake. This section cites Indigenous Knowledge as informing the receptor selection and location.</p> <p><b>Rationale:</b> While the assessment is fairly conservative in the assumptions made on intake and receptor habits, it stands to reason that if the trapper receptor was located closer to the operation, such as at McGowan or Whitefish Lakes, this exceedance of Se could be more pronounced.</p> <p>In terms of maintaining a conservative assessment, if the most vulnerable receptor can be shown to be protected at the point of highest expected COPC concentration, it can be concluded that this receptor would be protected further away from the Project. Considering this, why was the hunter/trapper receptor not also assessed at Whitefish or McGowan Lake? Was Indigenous Knowledge specific in mentioning Whitefish or McGowan Lakes were not used for the activities carried out by identified receptors?</p>	<p>Please provide justification for excluding a receptor from occupancy at lakes closer to the Project during operation (McGowan, Whitefish). Alternatively, conduct a risk assessment to a receptor at these lakes during operation to determine if there is a predicted risk that may require monitoring or mitigation.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> CNSC recommends the following:</p> <ul style="list-style-type: none"><li>Assessment of a receptor located closer to the point of effluent release may need to be considered to ensure there are negligible risks</li><li>If Se is expected to exceed hazard quotients further upstream, selenium removal technology may be required as part of the effluent treatment process as a mitigation measure. Other COPC’s exceeding an HQ of 1 may also be identified under this process that could require specific monitoring or mitigation measures.</li></ul>	Response is accepted, but also see AD-59 in the Advice to Proponent table.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-181	-	CNSC	Human Health with respect to radiation exposure	Section 10.1.6.1.4	<p><b>Context:</b> In section 10.1.6.1.4, it is stated: “The maximum incremental radon concentration at the camp worker site during Operation was predicted to be 12.4 Bq/m3, which is below the CNSC limit of 60 Bq/m3 for incremental radon.”</p> <p>As per IR-176, there is no such CNSC limit for incremental radon.</p> <p>The camp worker would be considered a person who is not a nuclear energy worker (NEW) and subject to the dose limits of section 13 and 14 of the Radiation Protection Regulations, not the dose limit for the general public as per subsection 1(3) of the Radiation Protection Regulations. The CNSC has regulatory requirements for the ascertainment and recording of doses of radiation as per section 5 of the Radiation Protection Regulations. Every Licensee must ascertain and record the magnitude of exposure to radon progeny, the effective dose and equivalent dose received by and committed to a person who performs duties in connection with any activity that is authorized by the Nuclear Safety and Control Act or is present at a place where that activity is carried on.</p> <p>The camp worker performs duties in connection with the Licensed activity and is present at the location where the activity is carried out. Hence, they are not considered to be a member of the general public (who has no connection with the activity)</p> <p>Further, the Proponent indicates that the maximum incremental radon dose to the camp worker was estimated to be 0.13 mSv/year during Operation. The assessment assumes that the camp worker spends 100% of the time indoors. Table 10.1-11 shows the maximum total incremental dose for the camp worker to be 0.02 mSv/year. This appears to be a discrepancy.</p> <p>Table 5.2 in Appendix 10-C provides internal annual dose from radon inhalation. The radon doses to some NEW workers (9.44E-02 mSv/a Driller 1 and 1.03E-01 mSv/a Wellfield Operator 1, 2) here appear less than the radon dose (0.13 mSv/year from section 10.1.6.1.4) to the camp worker, who is a non-nuclear energy worker.</p> <p><b>Rationale:</b> The reason for the requested change is to ensure consistency with the Radiation Protection Regulations and the environmental impact statement.</p>	<p>The EIS and appendices should be aligned with the Radiation Protection Regulations by:</p> <ol style="list-style-type: none"><li>1. Removing the reference to a 60 Bq/m3 limit for incremental radon.</li><li>2. Revising all references to the ‘public dose limit’ applied to camp workers (non-NEWs) to align with section 13 and 14 of the Radiation Protection Regulations.</li></ol> <p>The Proponent should explain why the radon dose for the camp worker appears as 0.13 mSv/year in one instance and 0.02 mSv/year in another.</p> <p>The Proponent is also asked to provide the rationale as to why a non-NEW has a higher radon dose than a NEW.</p>		Accepted	n/a
IR-182	-	HC	Change to an environmental component due to radiological contaminants	Section 10.1.6.1.4, (p. 10-44)	<p><b>Context:</b> Section 10.1.6.1.4 states, “The limit is incremental and is exclusive of natural background, such as natural levels of radon and medical exposures. A dose constraint of 0.3mSv/yr was established for the public from all radionuclides and all pathways for the Project, as recommended by Health Canada (2010a). The dose constraint represents a dose lower than the public dose limit that ensures the combined dose from multiple sources does not result in exceedance of the public dose limit. Radon dose was calculated separately from the dose due to other radionuclides; however, the predicted radon concentration was compared against the CNSC incremental concentration limit of 60 BQ/m3” (p. 10-44).</p>	<p>1. Provide clarification on how combined doses from all sources would be accounted for in respecting the public dose limit of 0.3 mSV/yr if radon concentrations are being calculated separately.</p>	Response is accepted, but also see AD-65 in the Advice to Proponent table.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<b>Rationale:</b> Calculating radon separately from all radionuclides may underestimate the health risks by not considering combined doses from multiple sources when comparing to the public dose limit constraint of 0.3 mSv/yr recommended by Health Canada (2010a).				
IR-183	-	CNSC	Human Health with respect to radiation exposure	Section 10.2  Appendix 10-C	<b>Context:</b> Exposure scenarios for workers have been identified and high-level summaries of the assumptions and resultant dose estimates have been provided. However, the detailed dose calculations have not been provided.  <b>Rationale:</b> The method used to estimate effective, equivalent and committed dose is required to be verified. Sample dose calculations should be included, to confirm use of acceptable input data, for at least the most dose significant scenarios.	Provide the dose calculations for deriving the dose estimates for workers in all exposure scenarios, for at least the most dose significant scenarios.		Accepted	n/a
IR-184	-	CNSC	Human Health with respect to radiation exposure	Section 10.2  Appendix 10-C, 2.0	<b>Context:</b> It is stated in Appendix 10-C, section 2.0 that: “In addition, the CNSC has proposed a 100 mSv 5-year equivalent dose to lens of eye, in accordance with recent recommendations of the International Commission for Radiological Protection (ICRP, 2012a). This implies an average annual equivalent dose to lens of 20 mSv/a and will be considered as an applicable dose limit for workers.”  As per section 14 of the Radiation Protection Regulations, the equivalent dose limit for the lens of an eye for nuclear energy workers (NEWs), effective January 1, 2021, is 50 mSv in a one-year dosimetry period.  <b>Rationale:</b> The reason of the requested change is to ensure consistency with the Radiation Protection Regulations.	The EIS and Appendix 10-C should be aligned with the Radiation Protection Regulations regarding the equivalent dose limit for the lens of an eye for NEWs.		Accepted	n/a
IR-185	-	CNSC	Human Health with respect to radiation exposure	Section 10.2.3.2  Appendix 10-C Table 3.10-3.12	<b>Context:</b> The Geometries for External Exposure Scenarios Modelled in MicroShield for Sources in various locations were provided in tables 3.10-3.12 in appendix 10-C. The doses from those scenarios were omitted.  <b>Rationale:</b> The method used to estimate effective, equivalent, and committed dose is required to be verified. Sample dose calculations should be included, to confirm use of acceptable input data.	The Proponent is asked to provide all the necessary information and assumptions required to perform the MicroShield calculations independently and to list the resulting calculated values from the listed scenarios.		Accepted	n/a
IR-186	-	CNSC	Human Health with respect to radiation exposure	Section 10.2.3.2.4 Section 10.2.3.2.6 Section 10.2.4  Appendix 10-C, Section 3.2	<b>Context:</b> In sections 10.2.3.2.4 and 10.2.3.2.6, as well as section 3.2 of Appendix 10-C, the Proponent has stated that workers in the drying and packaging areas of the processing plant will be required to wear powered air purifying respirators (PAPR) to reduce/eliminate inhalation exposure.  Further in section 10.2.4, which elaborates mitigation measures, it is stated: “For the drying and packaging/loading areas of the ISR plant, use of PAPR has been assumed. It will be needed in these areas, and it has been planned in these areas to substantially reduce doses from inhalation of uranium dust. Dust levels in these areas will be monitored and kept ALARA.”  The use of respirators appears to be in contradiction of the requirements of section 13 of the Uranium Mines and Mills Regulations, which states: <i>No Licensee shall rely</i>	Provide the rationale for mandating the use of respirators by workers in the drying and packaging areas of the processing plant.  Include the demonstration of the application of the hierarchy of control for radiological protection within the design of these areas of the processing plant.  Justify that this approach complies with section 13 of the Uranium Mines and Mills Regulations.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p><i>on the use of a respirator to comply with the Radiation Protection Regulations unless the use of the respirator (a) is for a temporary or unforeseen situation; and (b) is permitted by the code of practice referred to in the licence.</i></p> <p>The Proponent is also reminded that respirators should not be the first choice for dose reduction in workplaces. They should only be used when the hierarchy of control (elimination, substitution, engineering, or administrative controls) is not possible.</p> <p><b>Rationale:</b> At this stage of the Project, the Proponent is expected to identify design improvements to these areas of the ISR plant/processing plant following the hierarchy of control for the radiological protection of workers, as per regulatory requirements and as described in REGDOC-2.7.1, <i>Radiation Protection</i>.</p>				
IR-187	-	CNSC	Human Health with respect to radiation exposure	Section 10.2.3.2.4 Section 10.2.3.2.6  Appendix 10-C, Section 3.3, 6.0	<p><b>Context:</b> The exposure scenarios and assumptions for the workers in the drying area and the packaging/loading area of the processing plant include the wearing of PAPRs, which is assumed to provide a 1000-fold reduction in dust exposure.</p> <p>Further to reference IR-186, the use of a respirator as well as in worker dose predictions for the Project, appears to contravene section 13 of the Uranium Mines and Mills Regulations, and does not follow the hierarchy of controls for radiological protection of workers as described in REGDOC-2.7.1, <i>Radiation Protection</i>.</p> <p><b>Rationale:</b> At this stage of the Project, the Proponent is expected to identify design improvements to these areas of the ISR plant/processing plant following the hierarchy of control for the radiological protection of workers, as per regulatory requirements and as described in REGDOC-2.7.1, <i>Radiation Protection</i>.</p>	<p>Modify the exposure scenarios and assumptions (i.e., remove the use of a respirator) for the workers in the drying area and the packaging/loading area of the processing facility.</p> <p>Assess the resultant exposures against CNSC regulatory dose limits and the ALARA principle.</p> <p>Identify mitigation measures as per the hierarchy of control for radiological protection.</p>		Accepted	n/a
IR-188	-	CNSC	Human Health with respect to radiation exposure	Section 10.2.4	<p><b>Context:</b> The following is stated in section 10.2.4: “Dust inhalation is also a potentially substantial component of worker dose at the core shack. At this location, PAPR will not be required; however, N95 masks will be used, and dust levels will be monitored here...It may be possible to increase air exchange in the core shack, above the planned six exchanges per hour, should this be necessary. This would also reduce radon exposure in the core shack.”</p> <p>If it is possible to increase air exchanges in the core shack, it is not clear why this was not assessed and incorporated in the design of the core shack.</p> <p><b>Rationale:</b> It appears that a control measure (e.g., air exchange protocols in the core shack) to reduce the exposure to workers has been identified. However, it is not certain if it has been formally documented to ensure that it is incorporated in the engineered design of the core shack.</p>	<p>Provide details on how the control measures to reduce the exposure to both workers through the air exchange protocols in the core shack have been formally documented to ensure that it is incorporated in the engineered design of the core shack.</p>		Accepted	n/a
IR-189	-	CNSC	Woodland Caribou Ecological Model	Appendix 10-A (ERA)	<p><b>Context:</b> In the ERA (p. C.12, section 2.3.6 Woodland Caribou) it is stated: “For the ecological model a diet comprised of 50% browse, 20% lichen and 30% macrophytes is assumed for the woodland caribou.”</p>	<p>Please provide additional evidence to support that those Woodland Caribou who may have higher consumption rates of lichen as part of their diet, will remain protected. This can be provided through including a second model that assumes 70%</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>In the EIS, section 9.3.3.3.1, it is stated: “Research has shown that up to 70% of the year-round diet of caribou may consist of ground and arboreal lichens.”</p> <p><b>Rationale:</b> It is unclear whether the assumptions in the ecological model in the ERA regarding Woodland caribou diet are conservative, given only 20% lichen intake in the model. Lichen is known to accumulate COPC such as metals and dust from the atmosphere.</p>	<p>lichen in the diet.</p> <p>See also related: IR-138.</p>			
IR-190	-	HC	Change to an environmental component due to hazardous contaminants	<p>Appendix 10-A (ERA), Table 3-8 (p. 3.31) and Table 3-9 (p. 3.36)</p> <p>Appendix 6, Table 5 (p. 16)</p>	<p>NO2 criteria is not being consistently compared.</p> <p><b>Context:</b> Provincial and federal air quality criteria/screening values for NO2 have been used inconsistently.</p> <p>Table 3-9 in Appendix 10-A (ERA) uses the 2015 Saskatchewan Ambient Air Quality Standards (SAAQS) value of 300 µg/m3 to compare the maximum concentrations of NO2 at receptor locations for the 1-hour average period, while Table 5 of Appendix 6 uses the 2025 Canadian Ambient Air Quality Standards (CAAQS) of 79µg/m3 for the same average period time.</p> <p><b>Rationale:</b> By utilizing the SAAQS screening value for NO2, the maximum concentrations at receptor locations exceed the 1-hour threshold solely during the decommissioning stage (Table 3-9). However, if the 2025 CAAQS are applied, the screening values would be exceeded at receptor locations for all project phases. It is best practice to use the more protective air quality standards to evaluate potential human health risks associated with project activities.</p>	<p>1. Compare the predicted maximum concentrations to the most protective applicable air quality standards available. Alternatively, provide a rationale as to why the SAAQS for NO2 were used rather than the more protective 2025 CAAQS to determine potential exceedances and screen for the need for additional mitigation measures.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> Health Canada recommends use of the standards from the 2025 CAAQS for NO2 in future mitigation and follow-up plans.</p>	<p>Following the supplementary submission by Denison on July 5th, 2024, one minor correction remains outstanding. There is an error in Section 3.2.1.3.1 Nitrogen Dioxide (updated text in the ERA in Appendix 10-A):</p> <p>The results reported in the paragraph under the Summary of Exceedances at Human/Ecological Locations sub-heading (0.3% of the year for approximately 28 hours per year) is associated with the <u>operation phase</u> and not the decommissioning phase.</p> <p>This editorial error must be corrected in the final EIS submission package. This IR is accepted for the purposes of the EA review.</p> <p><i>The following outstanding issues will be further assessed as part of licensing technical reviews, prior to the granting of a licence:</i></p> <ol style="list-style-type: none"><li>1) In their documents to support their licence application, the proponent will have to describe mitigation measures to minimize releases of NO2. If this information is not described, CNSC staff will request the proponent to provide the information.</li><li>2) 1-hour threshold for NO2: Denison should not rely on a single study (Hesterberg et al., 2009) to support a 1-hour threshold for NO2. Denison is expected to consult more than one study. Denison will be required in their environmental risk assessment submitted as part of licensing to demonstrate that there will be no unreasonable to the environment and to the health of people as a result of NO2.</li></ol>	Accepted	n/a
IR-190	IR-190-R1	HC	Change to an environmental component due to hazardous contaminants	<p>Section 6.1.3.2.2 (p. 6-21)</p> <p>Table 6.1-8 (p. 6-22); and,</p> <p>Table 6.1-9 (p. 6-22)</p>	<p>Limitations with the proposed use of passive NO<sub>2</sub> monitoring would not allow comparison of measurement results to the 2025 CAAQS for 1-hour NO<sub>2</sub>.</p> <p><b>Context:</b> In response to IR-190, there was agreement to using the 2025 CAAQS for NO<sub>2</sub> in future mitigation and follow-up plans, which Health Canada supports. However, the proposed air quality monitoring and follow-up plans (Chapter 6.1.8)</p>	<p>1. Provide additional details on proposed air quality monitoring for NO<sub>2</sub> that will allow for comparisons to both the 1-hour and annual 2025 CAAQS and how that will be used to support mitigation and follow-up plans. Distinguish between comparisons with measured and modelled monitoring data, as well as use of passive and active samplers.</p>	<p><i>This IR has been accepted for the purposes of the current EA process, and the outstanding issues below will be further assessed as part of licensing technical reviews, prior to the granting of a Licence.</i></p> <p>Please provide the following information:</p>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
				<p>Section 6.1.8 (p.6-44)</p> <p>IR-190 Response from Denison</p>	<p>anticipate continued use passive NO<sub>2</sub> samplers, which do not measure hourly (1-hour) concentrations.</p> <p>Section 6.1.3.2.2 indicates that the assessment makes use of passive samplers to measure NO<sub>2</sub> at two sampling locations. The results from those samplers are presented in tables 6.1-8 and 6.1-9, for a ~30-day sampling period (i.e., a total concentrations for NO<sub>2</sub> in ambient air over ~30 days).</p> <p>While passive samplers provide measurement data for comparison to the annual 2025 CAAQS for NO<sub>2</sub>, measurement data for the 1-hour NO<sub>2</sub> standard commonly requires use of an active sampler.</p> <p><b>Rationale:</b> Health Canada encourages the monitoring of air contaminants when exceedances or near-exceedances of air quality criteria, standards and/or guidance values are predicted or reported, to:</p> <ul style="list-style-type: none"><li>determine the accuracy of predictions;</li><li>help verify whether standards are being met; and,</li><li>assist with implementing or modifying mitigation measures.</li></ul>	<p>2. If multiple approaches will be used to monitor NO<sub>2</sub> (e.g., use of passive and/or active samplers, modifications due to differences between project phases, etc.), describe their intended contribution to the monitoring objectives and outcomes (e.g., determine the accuracy of predictions; assist with implementing or modifying mitigation measures).</p>	<p>1. Clarify the conditions under which a switch from passive to continuous monitoring would be warranted (e.g., if the 30-d measured NO<sub>2</sub> concentration, after conversion to a 1-h concentration, approaches or exceeds the 1-h CAAQS value).</p>		
IR-191	-	HC	Change to an environmental component due to hazardous contaminants	<p>Appendix 10-A (ERA), Table 3-9 (p. 3.36) and Table 3-10 (p. 3.46)</p> <p>Section 6.1.8 (p. 6-44)</p>	<p>Non-threshold substances are not included in screening and monitoring plans.</p> <p><b>Context:</b> Fine particulate matter (PM2.5) is not being considered further in secondary air quality screening for short and long-term exposure at human and ecological receptors because it is not predicted to exceed the screening values of the Ontario Ambient Air Quality Criteria (OAAQC) or the Canadian Ambient Air Quality Standards (CAAQS) for both annual and 24-hour average periods (Tables 3-9 and 3-10). Furthermore, it is not compared against the baseline for analysis.</p> <p>Table 3-9 indicates that coarse PM (PM10) is predicted to exceed the 24-hour CAAQS during all phases of the Project. However, Appendix 10-A p. 3.46 states that, “There were no exceedances of PM2.5 which is generally considered to be a more reliable indicator of potential health effects. However, health effects would be infrequent and reversible, subsiding after exposure; therefore, PM10 was not considered for further quantitative assessment in the ERA.”</p> <p>PM10 and PM2.5 were not included in the air quality monitoring plan (Section 6.1.8).</p> <p><b>Rationale:</b> Particulate matter and NO2 are considered non- threshold pollutants, meaning that health effects can occur at any level of exposure, The CAAQS for PM2.5 PM.10, and NO2 recognize that there is no population health threshold for human health effects; therefore, any increase in exposure will result in an incremental population risk (Environment Canada and Health Canada, 2012; CCME, 2000). The CAAQS values should not be construed as limits to which polluting up to is allowed. In addition, based on the principles of keeping clean areas clean and continuous improvement, proposed mitigation measures should not be confined to meeting the standards but should also be targeted towards reducing population</p>	<p>1. Include PM2.5 and PM10 in the secondary air quality screening for short and long- term exposure at human receptors.</p> <p>2. Include PM10 and PM2.5 in the air quality monitoring plan as they are non- threshold substances.</p> <p>3. Provide a discussion of the significance of predicted exceedances of health- based standards.</p> <p>4. Identify additional mitigation measures to reduce concentrations of non- threshold air contaminants associated with the Project.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> Health Canada recommends use of the <u>2025 CAAQS Management Levels</u> to develop mitigation measures that reduce project contributions of non-threshold pollutants (e.g., PM2.5, NO2).</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>exposure to CACs associated with the proposed project.</p> <p>Furthermore, although health risks associated with PM2.5 are higher than those associated with PM10, both fractions are considered non- threshold pollutants and identified by IARC (2013) as causes of cancer.</p> <p><b>Reference:</b> [1] International Agency for Research on Cancer (IARC). 2013. IARC monographs on the evaluation of carcinogenic risks to humans. Volume 109. Outdoor air pollution. Lyon: International Agency for Research on Cancer.</p>				
IR-192	-	CNSC	Human Health with respect to radiation exposure	Appendix 10-A (ERA), Section 3.1.1.2, including Tables 3-1 and 3-2	<p><b>Context:</b> Section 3.1.1.2 in Appendix 10-A (ERA) provides the method of how select constituents including cadmium, chromium, selenium and lead-210 were determined. This section does not mention how the other constituents as listed in Tables 3-1 and 3-2 are determined.</p> <p>The values for Th-230 and U-238 in Table 3-1 are unexpected. Typically, these values should be at equilibrium.</p> <p><b>Rationale:</b> The technical basis for the selection of constituents of concern is required as part of the environmental and human health risk assessments.</p>	<p>1. Provide the methodology of how all listed constituents are determined.</p> <p>2. Provide the rationale as to why Th-230 and U-238 are not in equilibrium.</p>		Accepted	n/a
IR-193	-	ECCC	Change to an environmental component due to hazardous contaminants	Appendix 10-A (ERA), Section 3.1.1.2  Section 8.2.4.2.3	<p><b>Context:</b> Appendix 10-A (ERA) Table 3-1 ‘Screening of Effluent Quality against Surface Water Quality Guidelines for the Wheeler River ERA’ does not include acute water quality thresholds for all COPCs compared against predicted effluent quality. For example, it is stated that the final effluent quality discharge target for uranium is 0.057 mg/L. However, the CCME water short term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guidelines, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe.</p> <p>All water quality thresholds should be derived from receiving environment parameters, and there are discrepancies between the values used in Appendix 10-A (ERA) Table 3-1 and the values presented in Tables 8.2-8 and 8.2-10 in Section 8.2.4.2.3 of the draft EIS. No selected screening value for TSS has been calculated from baseline conditions. Un-ionized ammonia, which is a regulated Schedule 4 substance under the MDMER, has not been included.</p> <p><b>Rationale:</b> A review of all modelling results for all COPCs under the MDMER will assist ECCC in understanding the potential risks to the receiving environment.</p>	<p>1. Provide acute and chronic water quality thresholds for all required COPCs with monitoring required under the MDMER.</p> <p>2. Ensure all water quality thresholds are derived from receiving environment baseline parameters and that these thresholds are consistently applied throughout the draft EIS.</p>	<p>In Denison’s July 2<sup>nd</sup>, 2024, supplementary submission, it is unclear what value Denison is applying as the screening criteria for un-ionized ammonia. The screening value provided in other tables (ex. Tables 8.2-2, 8.2-8, 8.2-10, 8.2-13, 8.2-14) all list the SEQG/CCME water quality guideline of 0.019 mg/L as the screening criteria.</p> <p>The recommendations for phosphorus and inclusion of the HC values in Table 3-1 are editorial and have no influence on the assessment results, therefore can be addressed in licensing.</p> <p>This IR is accepted for the purposes of the EA review, but Denison are expected to correct the remaining errors in Table 3-1 of the ERA in the final EIS submission package:</p> <ol style="list-style-type: none"><li>Un-ionized ammonia - The screening value of 0.0156 mg/L for un-ionized ammonia provided in Table 3-1 differs from what has been provided in other tables (ex. 0.019 mg/L in Tables 8.2-2 8.2-8, 8.2-10, 8.2-13, 8.2-14). Denison should confirm what screening criteria is used for un-ionized ammonia and which source it is referenced from.</li><li>Zinc – The screening value of 0.007 mg/L for zinc provided in Table 3-1 differs from what has been provided in other tables (ex. 0.013 mg/L in Tables 8.2-8, 8.2-10, 8.2-13, 8.2-14). Denison should confirm what screening criteria is used for zinc and which source it is referenced from.</li><li>Manganese – The CCME value of 0.26 mg/L for zinc provided in Table 3-1 differs from what has been provided in other tables (ex. 0.21 mg/L in Tables</li></ol>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
							8.2-8, 8.2-10, 8.2-13, 8.2-14). While a minor difference, the 0.21 mg/L value appears to be the correct value calculated using site-specific hardness and pH. Denison should verify which value is correct. 4. Molybdenum – the screening criteria used for the EcoRA is the SEQG of 31 mg/L. This is significantly higher the CCME guideline of 0.073 mg/L. The CCME guideline is outdated, however the SEQG guideline does not have a safety factor applied to it, and is significantly higher than other guidelines for Molybdenum. The BC WQG of 7.6 mg/L is both up-to-date and has a safety factor applied. Use of this guideline aligns with the principles of the Precautionary Approach and does not lead to any changes in risk conclusions in ERA (i.e. Molybdenum is still not screened into EcoRA assessment as the predicted effluent concentration is 2.5 mg/L and does not exceed screening criteria). It is recommended that in alignment with CSA N288.6 and the Precautionary Approach that Denison update the screening criteria for molybdenum for the EcoRa to utilize the BC WQG of 7.6 mg/L.		
IR-194	-	ECCC	Aquatic species	Appendix 10-A (ERA), Section 3.1.1.2 and Section 3.1.2.3	<p><b>Context:</b> In the ERA, COPCs should be selected for further assessment based upon the following factors:</p> <ol style="list-style-type: none"><li>COPC concentrations in effluent that exceed selected water quality guidelines for the protection of aquatic biota, and</li><li>Baseline COPC concentrations in the LSA that exceed selected surface water and sediment quality guidelines for the protection of aquatic biota.</li></ol> <p>However, only COPCs that had concentrations in effluent that exceeded guidelines were assessed further. Baseline concentrations of COPCs in sediment were not considered. In addition to this, not all COPCs that require monitoring under the MDMER had predicted effluent concentrations. From Section 8.2.3.3 Table 8.2-2 of the Aquatic Environment Report, it appears Aluminum in McGowan Lake and Whitefish Lake South and North, and pH in Whitefish Lake North exceed water quality guidelines. Predicted effluent concentrations or near-field surface water concentrations for Aluminum and pH are not provided.</p> <p><b>Rationale:</b> It is not possible to determine if there is risk from effluent to the receiving environment and aquatic receptors based on the current information provided.</p>	<ol style="list-style-type: none"><li>As noted in IR-114, provide the information on predicted effluent quality for COPCs with required monitoring under the MDMER.</li><li>Provide the information on predicted maximum receiving environment surface water concentrations for COPCs with required monitoring under the MDMER in IR-114.</li><li>Update the ERA to assess the risk of any additional MDMER COPC concentrations in effluent that exceed water quality guidelines.</li><li>Update the ERA to assess the risk of COPCs that had elevated baseline water and sediment quality concentrations in the receiving environment.</li></ol>	<p>There are multiple elements of this IR outstanding. This IR is being conditionally accepted, but these issues will need to be resolved during the licensing process. It is expected that a fully revised ERA that both incorporates revisions following closure of EA related IRs and addresses outstanding issues that will be further assessed during the licensing review.</p> <p><i>This IR has been accepted for the purposes of the current EA process, and the outstanding issues below will be further assessed as part of licensing technical reviews, prior to the granting of a Licence.</i></p> <p>Item one of the IR has been met. However additional information is required for items two, three, and four. Similar to ECCC’s rationale provided for IR-124, “the ERA primarily relies on modelling results to identify the maximum predicted levels of COPCs in the receiving environment.” However, due to the upper bound discharge rates being the only model input evaluated, it is unclear whether the model considered scenarios where maximum COPCs might occur as the exclusion of other environmental variables may have resulted in inaccurate maximum environmental concentrations of the COPCs.</p> <p>The Proponent’s responses regarding baseline exceedances of COPC thresholds in the receiving waterbodies requires additional information. The modeling of surface water and sediment COPC’s described in Appendix 10-A, Figures 6-1 and 6-2 respectively, show results for the receiving waterbodies. However, it is unclear if these modeled values are based on the worst-case scenarios that account for environmental variables such as seasonal changes in hydrology and chemistry, or if they have only accounted for changes in operational effluent discharge scenarios to consider the upper bound discharge rates. Including the upper bounds of operational effluent discharges regardless of the variability of the receiving environmental conditions is important factor for determining whether the baseline data and risk assessment fully considered the effects of the</p>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
							operations of the proposed mine, including environmental concentrations of the COPCs, on water quality.  The Proponent should provide baseline data and a risk assessment that includes consideration of maximum COPC scenarios for the receiving water bodies, including seasonal variability and sediment depositional areas. The Proponent should provide supplemental information to identify if the environmental model has considered environmental variability such as seasonal changes in water levels, flows and sedimentation. The Proponent should also demonstrate that the model has considered a reasonable expected worst case scenario, such as a 100 year return.		
IR-195	-	ECCC	Change to an environmental component due to hazardous contaminants	Appendix 10-A (ERA), Section 3.1.2.1	<b>Context:</b> Figure 3-2 depicts modelled concentrations of COPCs in the receiving environment surface water during all Project phases. Effluent discharge rates during Operations and Decommissioning are not anticipated to differ significantly. However, COPC concentrations seem to decrease rapidly after the end of the operations period despite effluent releases continuing into the decommissioning phase.  <b>Rationale:</b> There has been no information provided on predicted changes in effluent COPC concentrations and discharge rates during the decommissioning phase. It remains unclear how COPC concentrations would decrease so quickly following the end of operations.	1. Provide further information on modelled maximum COPC concentrations for each individual Project phase with estimated timing for peak concentrations to appear in the receiving environment.  2. Provide further information on predicted effluent quality during the Project decommissioning phase.  3. Update ERA figures and conclusions as needed.	Following Denison’s July 2 <sup>nd</sup> , 2024 supplementary submission, this IR is Accepted.	Accepted	n/a
IR-196	-	ECCC	Change to an environmental component due to hazardous contaminants	Appendix 10-A (ERA), Section 3.1.2.3	<b>Context:</b> Table 3-6 provides predicted maximum sediment concentrations of COPCs compared to sediment quality guidelines. Several selected sediment screening values are not the most stringent sediment quality guidelines, with no justification provided. Additionally, copper and lead appear to be missing guidelines that are available from the Burnett-Seidel and Liber (2013) study.  <b>Rationale:</b> The most stringent guidelines should be used for the sediment quality risk assessment in the ERA. Use of the most stringent guidelines will allow the most protective assessment to analyze risks to the receiving environment, aquatic and terrestrial biota.	1. Provide further information and justification for the selection of less stringent thresholds.  2. Update the ERA as needed.		Accepted	n/a
IR-197	-	ECCC	Aquatic species	Appendix 10-A (ERA), Section 3.2	<b>Context:</b> It remains unclear if atmospheric deposition from Project related emissions has been incorporated into modelling for the ERA and surface water and sediment quality assessments.  <b>Rationale:</b> While expected Project air emissions are unlikely to have direct impacts on the aquatic receiving environment and aquatic biota, this Project effect pathway may have indirect effects through accumulation of COPCs over time or deposition of contaminants that are not expected in effluent, which should be evaluated with predicted emissions data incorporated into water quality modelling predictions.	Incorporate atmospheric deposition from Project-related emissions into water quality modelling and assess any Project related effects to aquatic receptors from this pathway.	In Denison’s July 5 <sup>th</sup> , 2024 supplementary submission, items one, two, and three were addressed. However, the sample calculation was not added to Section 2.2 of Appendix A, which would support the February 2024 statement that atmospheric deposition is negligible.  This IR is accepted for the purposes of the EA review, but Denison is expected to add this sample calculation in the final EIS Submission package.	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-198	-	HC	Change to an environmental component due to radiological contaminants	Appendix 10-A (ERA) Appendix B, Tables B.7 and B.8 Ref. 19-2638  Appendix 10-A (ERA), Table 4-3 Ref. 19-2638 (p. 4.17)	<p><b>Context:</b> Section 10 Appendix 10-A (ERA) contains Table 4-3 (p. 4.17), which lists ingestion rates for traditional foods and includes the category “organs” for Mammals.</p> <p>Tables B.7 and Table B.8 in Section 10 Appendix 10-A (ERA) Ref. 19-2638 provide the predicted concentrations of radionuclides for ecological receptors during the Project phases and during future centuries, respectively. They list the concentrations of radionuclides in moose and in moose organs, which is presented as a single cumulative organ value. Other terrestrial and aquatic animals (such as the black bear and woodland caribou) that are a part of the traditional diet of nearby Indigenous communities have higher concentrations of radionuclides than moose, yet concentrations are not provided for organs of these species.</p> <p><b>Rationale:</b> While Health Canada is not aware of transfer factors to individual organs, or to organs in animals that are not ruminants, it would be beneficial to have a better understanding of radionuclide concentrations in the organs of other animals that may be consumed by local Indigenous communities.</p>	<p>1. Provide more clarification on how the mammalian organ ingestion rates are calculated (which animals and relative contribution percentages).</p> <p>2. Provide a rationale for why concentrations of radionuclides were not assessed in organs of animals (other than moose) that are consumed as country foods by Indigenous people harvesting in the area.</p>	<p><i>This IR is accepted for the purpose of the EA review, but the following outstanding issues will be further assessed as part of licensing technical reviews, prior to the granting of a licence:</i></p> <ol style="list-style-type: none"><li>It is stated that the transfer factor (TF) for moose organs was scaled based on the beef organs transfer factor. What was this scaling value and was it similarly done for the caribou organs? (TF’s for beef, moose, and caribou are presented in Table 2).</li><li>In Table 2, Denison used the feed-to-animal TFs for “Beef-liver” provided in Table G.3 of N288.1-20 for each of their listed RNs. Nowhere in Table G.3 is a TF for Lead-210 provided. Denison is requested to provide the reference for this TF value for Lead-210.</li><li>CNSC staff are interested in the worked calculations for one of the estimated tissue concentrations presented in Table 3.</li></ol>	Accepted	n/a
IR-198	IR-198-R1	HC	Change to an environmental component due to radiological contaminants	<a href="#">Annex 1 Response to Information Requests (Denison Mining) – August 18, 2023</a>  IR-198 Response from Denison – COPC Concentrations in Organs ( <i>Pages 74, and 354-357 of 419</i> )  Appendix 10-A (ERA)	<p><i>Environmental Risk Assessment for Wheeler River</i> (September 9, 2022) does not include an assessment of radionuclides based on their mass concentrations in country foods (the assessment is only based on radionuclide concentrations).</p> <p><b>Context:</b> As part of the response to IR-198 estimated Pb-210 concentrations in moose organ and caribou organ of 7.15 and 49.4 mg/kg (ww) are reported, respectively. However, Appendix 10-A: <i>Environmental Risk Assessment for Wheeler River</i> (September 9, 2022) does not include an assessment of lead among the non-radionuclide COPCs.</p> <p>Using the organ meat consumption figure from the Patuanak community (16.2 g/day), exposure to Pb-210 from caribou organ meat is estimated at over 11 ug/kg bw per day (based on the response to IR-198) which would be close to 10 times greater than the 95<sup>th</sup> percentile dietary lead exposure estimates for the general Canadian population consuming retail foods.</p> <p><b>Rationale:</b> While the abundance of radionuclides may pose a health risk with respect to radioactivity, their presence as chemical contaminants may also have an impact on health. This is demonstrated by the case of Pb-210 described above. Due to their potential toxicological significance to human health, Health Canada recommends assessing arsenic, cadmium, lead and mercury as part of country food assessment, regardless of the method employed to determine COPCs.</p>	<p>1. Provide a rationale on why radionuclide mass concentrations were not assessed for their impact to human health.</p> <p>2. Provide an assessment of Lead (Pb) as a chemical contaminant (non-radionuclide) COPC to better understand potential health risks and inform management, mitigation, monitoring and/or follow-up planning.</p>	<p>Version 2 of the Commitment Register (July 17, 2024) included a commitment (ID 8-44) related to monitoring mercury in country foods. The wording of this commitment is specific to methylmercury. It was identified that the draft text provided to Denison by CNSC in the May version of the IR review that the request for commitment was missing the following details:</p> <p>“...monitoring lead and mercury in country foods, as well as including <b>arsenic, cadmium</b>, lead, and mercury in any further assessment conducted to determine their potential risk to human health from consumption of country foods”.</p> <p>The wording for Commitment 8-44 should be revised to fully capture these other COPCs.</p> <p>As well, CNSC staff noted that in their responses to IR-212-R2 and IR-100-R3, Denison has proposed a conceptual trigger-response mechanism framework. It is unclear to CNSC staff if this is referring to the monitoring detailed under Commitment 8-44, or if it is separate. If the latter, this conceptual trigger-response framework should be submitted to CNSC for review before it is finalized for implementation, for review as part of the licensing process.</p> <p>This IR is accepted for the purposes of the EA review, and the following must be corrected in the final EIS submission package:</p> <ol style="list-style-type: none"><li>Revise the wording for Commitment 8-44 to fully capture the other COPCs that Denison intends to include in their country foods monitoring.</li><li>Clarify if Commitment 8-44 will also include Denison’s proposed conceptual trigger-response framework.</li></ol> <p><i>The following elements of this commitment will be further assessed as part of</i></p>	Accepted	n/a

							<i>licensing technical reviews, prior to the granting of a licence:</i> <ol style="list-style-type: none"><li>Establishing/confirming baseline concentrations of Hg in water, sediment, and fish tissues before construction;</li><li>Regular monitoring during construction, operation and post-closure; and,</li><li>Undertaking an HHRA should monitoring results exceed established/confirmed baseline levels, to inform decisions on adaptive management and mitigation measures</li></ol>		
IR-199	-	ECCC	Change to an environmental component due to hazardous contaminants	Appendix 10-A (ERA), Sections 3.2.1 and 3.3.1, Wheeler River Project IMPACT Model	<p><b>Context:</b> Model calibrated concentrations of selenium, uranium, and lead- 210 are under-predicted compared to measured baseline concentrations for water quality in the IMPACT modelling based on Figure 3-2. Calibrated concentrations of cobalt are under-predicted and there is poor agreement between model calibrated and measured concentrations of arsenic, lead-210, polonium-210, and radium-226 for sediment quality in Figure 3-3.</p> <p><b>Rationale:</b> It is unclear how poor agreement between model calibrated and measured baseline concentrations of COPCs impacts the near-field and far-field modelling predictions of COPCs during all Project phases. It is also unclear why measured concentrations of COPCS could not be used directly as model inputs when there was poor agreement.</p>	<ol style="list-style-type: none"><li>Provide justification as to why model calibrated concentration inputs of COPCs were preferable for use in predictive modelling of water and sediment quality over measured baseline concentrations.</li><li>Provide a rationale detailing how under- or over-predicted model calibrated COPC concentration inputs influence IMPACT model predictions and uncertainty for water and sediment quality. Provide specific details on how this may impact the risk analysis for parameters that have been highlighted as having poor agreement between calibrated and measured concentrations (i.e., arsenic, selenium, uranium, lead-210, polonium-210, and radium-226).</li></ol>	<p><i>This IR has been accepted for the purposes of the current EA process, and the outstanding issues below will be further assessed as part of licensing technical reviews, prior to the granting of a Licence.</i></p> <p>The Proponent has not fully responded to either item for this IR. In the response for item one, the table provided in the response supports the statement added to Section 3.2.1 of Appendix A from Appendix 10-A, that there is little difference between the geometric and arithmetic means for parameter concentrations in water. It is important to clarify if this is also the case for sediment. Apart from arsenic and radionuclides, all modelled sediment concentrations are at or below geometric mean for sediment. Given that geometric means are typically lower than arithmetic means (and at most equal) this might indicate a consistent underestimation by the model for parameter concentrations in sediment. The proponent indicates that the geometric mean is more representative of the central value of the data distribution. ECCC does not support this view because a median or mode would be used to find a central value, depending on what was meant. The geometric mean may have been used because it is less influenced by outlier values, but these should be analyzed and removed if necessary before calculating the mean, as described in Section 6.3.3.6 of CSA N288.6:22. The only reference to geometric means in CSA N288.6:22 is for calculating means of literature values. Otherwise, when considering field data, an arithmetic mean is referred to.</p> <p>Typically, parameter concentration statistics are calculated individually for each site to highlight differences and help identify more sensitive sites. Differences between sites are expected because of differences in lake size, catchment area and other environmental factors. Pooling data from all sites smooths out high and low values, which compounds the smoothing done by using a geometric mean. This reduction in precision causes unreliability when evaluating model predictions, since the range of parameter concentrations at baseline is not well characterized.</p> <p>To address the lack of clarity, the Proponent should provide a table comparing arithmetic and geometric means for parameter concentrations in sediment, as they have done for water concentrations. If differences are significant, then modify graphs in Figure 3-3 of Appendix A from Appendix 10-A to compare arithmetic means of baseline data with modelled results. For parameters with sufficient data to calculate meaningful statistics, the Proponent should demonstrate that concentrations in Russell Lake are not significantly different</p>	Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
							<p>than those in McGowan and Whitefish Lakes. If water quality is significantly different between lakes, then the Proponent should modify graphs in Figure 3-2 of Appendix A from Appendix 10-A to compare lake-specific baseline and modelled concentrations.</p> <p>In the response to item two, the statement “<i>it is not appropriate to calibrate the model to baseline conditions as we are most interested in impacted conditions</i>” is incorrect, because the point of calibration is to demonstrate the model correctly simulates site conditions to predict concentrations. Inaccurate model predictions during baseline indicate the site and its system of interactions is not well understood, and the model would not be able to produce accurate predictions during operations either. Section 7.3.6 of CSA N288.6:22 states “<i>The models may be calibrated to give the best possible agreement with available monitoring data so that risk assessors can have confidence in model-predicted concentrations for areas and media that are poorly represented in monitoring programs.</i>” The monitoring data is insufficient to characterize baseline concentrations for most of the parameters in water since there are often less than 50% of samples with concentrations above the detection limits. This limits the parameters that can be used to evaluate the model to concentrations in water of chloride, sulphate and arsenic, as well as concentrations in sediment. The Proponent should demonstrate the accuracy of the model by comparing model outputs with measured concentrations for those parameters where there is sufficient data to calculate meaningful averages, quantify model uncertainty, and discuss the influence of uncertainty on risk assessment conclusions.</p> <p>Denison is expected to:</p> <ol style="list-style-type: none"><li>1. Calculate the model to baseline conditions, compare arithmetic and geometric means for parameter concentrations in sediment;</li><li>2. Calibrate model to baseline conditions;</li><li>3. Calculate parameter concentration statistics individually for each site; and</li><li>4. Modify graphs as needed if significant differences are observed.</li></ol>		
IR-200	-	HC	Indigenous Peoples' health / Socio- economic conditions	Section 10 (p. 4.10)  Appendix 10-A (ERA), Table 4-4 (p. 4.19)	Indigenous consultation should be included in the Country Foods analysis.  <b>Context:</b> The Proponent obtained country food consumption data through engagement with a single local fisher/trapper and from a dietary survey administered by CanNorth to the English River First Nations (ERFN) in 2017. However, the potential health risks to consumers of traditional food were only assessed using the data obtained from the CanNorth dietary survey. Section 10 of the EIS <i>states the following:</i> “The diet assumptions for the fisher/trapper are conservative and are based on engagement with a local fisher/trapper. The diet of the fisher/trapper is representative of one person, who consumes a unique composition and quantity of traditional foods (e.g., ingestion rate of 175 kg/yr of caribou, equivalent to approximately 2 to 3 servings per day). Most people fishing, hunting, and trapping in the Local Study Area and Regional Study Area would consume traditional foods more consistent with the average traditional foods consumer diet which was developed from the ERFN country foods study. In	1. Evaluate the suitability of using the 2017 EFRN survey results and consider surveying additional community members (such as local hunters/trappers) to obtain more representative country food consumption rates for use in the traditional foods risk assessment, and for communicating the results to the communities.  2. Additionally, consider evaluating consumption patterns (and applicable TRVs) of sensitive or vulnerable populations (e.g., elders, toddlers, women of childbearing age) in the traditional food risk assessment and provide risk levels for these sub-groups separately.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>comparison, the ERFN country foods study in Section 10 Appendix 10-A (ERA) Table 4- 4 indicates a caribou ingestion rate of 2.6 kg/yr (1 to 2 servings per month) and a total game ingestion rate of 21.3 kg/yr” (p. 4.10).</p> <p><b>Rationale:</b> Health Canada is in general agreement that the dietary habits of the local fisher/trapper may be an outlier and not necessarily representative of most of the local population. However, a rationale has not been provided to demonstrate whether and how the 2017 ERFN dietary survey results are representative of consumption patterns of local Indigenous communities. Also, it is unclear whether or how the ERFN dietary survey results account for the consumption patterns of vulnerable or more sensitive subgroups (e.g., heavy consumers, children and women of child-bearing age)</p>	<p><b>Suggestions for mitigation and follow-up measures:</b> Health Canada recommends providing the community with the opportunity to validate the ERFN 2017 survey results.</p>			
IR-200	IR-200-R1	HC	Indigenous People” health / Socio- economic conditions	<p>Section 10 (p. 4.10)</p> <p>Appendix 10-A (ERA), Table 4-4 (p. 4.19)</p> <p>IR-200 Response from Denison</p>	<p>The traditional foods risk assessment should be updated to include an “Intense Land User” scenario and consider all relevant sub-groups.</p> <p><b>Context:</b> See ‘Rationale for Status’ in IR-200</p> <p><b>Rationale:</b> Health Canada notes that the response to IR-1 confirms that the use, diet and consumption rates used to assess the “Trapper” receptor are representative of “intensive land users” from the ERFN and possibly others. This change in the assumption is significant and should be integrated into the traditional foods risk assessment. Suggestions and follow-up measures have been provided to assist in responding to this information request, which benefits from the clarity provided in response to IR-1.</p> <p>Health Canada also notes that the response to IR-200 did not consider evaluating consumption patterns (and applicable TRVs) of sensitive or vulnerable populations (e.g., elders, toddlers, women of childbearing age) in the traditional food risk assessment and provide risk levels for these sub-groups separately.</p>	<p>1. Update assumptions used in the risk assessment to reflect the new information provided in response to IR-1. (e.g., the <i>ERFN Trapper’s use of the area as <b>representative</b> of current and future land users</i>).</p> <p>2. Update the risk assessment in the EIS and ERA for the “Trapper” receptor (i.e., Intensive Land Users) to account for the <b>representative</b> nature of their described diet (i.e., consumption rates and composition).</p> <p>3. Update the rationale and decisions related to management, mitigation, monitoring and follow-up. Include a specific discussion for those COPCs that contribute to elevated health risks among “intensive land users” and those raised by Indigenous communities (i.e., selenium, mercury &amp; cadmium).</p> <p>4. Revise receptor’s descriptor/title from “Trapper” to “Intensive land users” throughout the EIS and ERA to be consistent with proposed revisions made in response to IR-1.</p> <p>Consider evaluating consumption patterns (and applicable TRVs) of sensitive or vulnerable populations (e.g., elders, toddlers, women of childbearing age) in the traditional food risk assessment and provide risk levels for these sub-groups separately. Alternatively, provide a fulsome rationale to justify their exclusion.</p>		Accepted	n/a
IR-201	-	ECCC	Aquatic species	Appendix 10-A (ERA), Section 5.0	<p><b>Context:</b> For the ERA methodology the Proponent followed CSA N288.6-12 for the assessment of risk to aquatic biota from radionuclide and non-radionuclide COPCs. This is the 2012 version, and a more recent 2022 version was publicly released.</p> <p><b>Rationale:</b> The Proponent should review the most up-to-date version of the standard to ensure no changes to the methodology of the COPC exposure assessment are required for the ERA.</p>	<p>Update the COPC exposure assessment methodology in the ERA using the most recent CSA N288.6-22 standard, as needed.</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-202	-	CNSC	QA/QC	Appendix 10-A (ERA), Section 6.0- Quality Assurance	<p><b>Context:</b> This section provides only Quality Assurance (QA) of the ERA, including planning and preparation of the ERA.</p> <p><b>Rational:</b> The Quality Control (QC) aspects are not included. Both QA and QC aspects provide confidence that ERA results are defensible and fit for use in decision-making.</p> <p>The N288.6 (Clause 10.2) requires that “Appropriate QA/QC requirements shall exist for all aspects of the ERA and should be specified prior to conducting the ERA”.</p>	Please include appropriate QC aspects, as per a Clause 10.2 of the N288.6.		Accepted	n/a
IR-203	-	CNSC	Sediment Quality and Benthic Invertebrates	Appendix 10-A (ERA), Section 6.2 Future Centuries Sensitivity Analysis	<p><b>Context:</b> This section of the ERA states “If treated effluent was released at the maximum upper bound discharge rate, the modelled concentrations of all COPCs are expected to be below their corresponding sediment quality guidelines.” It appears from Figure 6-2: “Comparison of maximum concentrations of COPCs in sediment at expected and upper bound discharge rate” that cadmium and vanadium would be over their sediment quality guidelines indicated if maximum upper bound discharge rates are used.</p> <p><b>Rationale:</b> It is not clear which is correct; the statement that no exceedances of sediment quality guidelines when considering the maximum upper limit effluent release, or the figures indicating there could be exceedances for cadmium and vanadium. This discrepancy in the ERA should be explained and corrected.</p>	Please provide clarity on if cadmium and vanadium are expected to be over the sediment quality guidelines for the maximum upper bound discharge rate scenario.		Accepted	n/a
IR-204	-	CNSC	Human health with respect to hazardous contaminants	Appendix 10-A (ERA), 7.1.1, Non-radiological Human Health Risk Assessment	<p><b>Context:</b> In the human health risk assessment of the non-radiological COPCs, it was determined that the Project incremental HQ was predicted to remain below 0.2 for all non-carcinogens and all pathways during all phases of the Project, except for selenium for the fisher/trapper at Russell Lake from the fish ingestion pathway.</p> <p><b>Rationale:</b> Given that the fisher/trapper receptor will likely be exposed to higher concentrations of selenium from the consumption of fish at Russell Lake, there is an elevated risk of selenosis in exposed individuals. This potential for selenosis would be further exacerbated in individuals who consume fish taken from other lakes closer to the mining operation. There is, however, no discussion of mitigation of these risks to exposed individuals.</p>	<p>Please provide a discussion of measures that could be applied to mitigate the risk of selenosis in exposed individuals who consume fish from Russell Lake and other waterbodies closer to the mining operation.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> CNSC recommends the following:</p> <ul style="list-style-type: none"><li>Selenium abatement technologies may be considered to eliminate or reduce selenium in effluent entering the lake system.</li><li>If HQs continue to exceed 0.2, then it may be necessary to post fish consumption advisories, in consultation with the Medical Officer of Health for the jurisdiction where the Project is located.</li></ul>		Accepted	n/a
IR-205	-	CNSC	Geology and Groundwater	Section 7, appendix H	<p><b>Context:</b> In this appendix the analytical concentration of various groundwater samples taken from monitoring wells is reported.</p> <p><b>Rationale:</b> There is one sample labeled as “Tracer Tank” with no definition available in the current report. It is difficult to judge whether the results presented are relevant to the EIS and how it may impact the findings therein.</p>	Please clarify the definition of “tracer tank”.		Accepted	n/a
IR-206	-	CNSC	Current use of lands and resources for	Section 11 Section 12 Section 15	<p><b>Context:</b> Impacts to Lands and Resources Use have been identified by Indigenous Nations and communities.</p>	Please describe any outstanding or residual issues or concerns raised by Indigenous Nations and communities that Denison was unable to address. In addition, outline any plans to find		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
			traditional purposes	Section 16	<b>Rationale:</b> Additional information is required to demonstrate whether Indigenous Nations and communities were engaged directly by Denison regarding the cumulative effects assessment, significance determination and residual effects, and thus the overall conclusions on potential adverse impacts of the Project on the potential or established Indigenous and/or treaty rights and effects of changes to the environment on Indigenous peoples, pursuant to paragraph 5(1)(c) of the CEAA 2012.	solutions or continue discussions with the potentially impacted Indigenous Nations and communities.			
IR-207	-	CNSC	Current use of lands and resources for traditional purposes	Section 11, Perceived Risks to Lands and Resources	<p><b>Context:</b> The EIS states: “Resource users may also experience changes in their perception of the quality of resources for consumption such as the palatability of fish or wildlife or have apprehensions about the safety of resources for consumption. These changes may affect the patterns of ILRU during all Project phases including Post Decommissioning. The ERFN refer to this indicator as a “psycho-social’ effect, meaning that even if people know their fears are “<i>perceived fears, the fear ... is real and has real impacts on ERFN members’ perception of their overall health and well-being</i>” (ERFN and SVS 2022a).” (p. 11-11)</p> <p>Resource harvesters may experience Project-related disturbances and, depending on how these changes are perceived, it may cause some resource harvesters to avoid the Project Area.</p> <p>Reductions in harvests may occur based on fear or uncertainty about the ongoing quality of country foods. For example, “<i>People stopped picking berries in this area when Key Lake mine was established because of concerns about health impacts</i>” (ERFN and SVS 2022b).</p> <p><b>Rationale:</b> CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> state: “The EIS will document specific suggestions raised by Indigenous groups for mitigating the effects of changes to the environment on Indigenous peoples (section 5(1)(c) of CEAA 2012). For the mitigation measures intended to address the effects of changes to the environment for Indigenous peoples, the Proponent must discuss the residual effects with the Indigenous groups prior to submitting the EIS.”</p> <p>These changes may affect the patterns of ILRU during all Project phases including Post Decommissioning.</p>	<p>How does Denison plan to work directly with Indigenous Nations and communities who currently use the potentially impacted areas, including the RSA, to mitigate and monitor the perceived risks and/changes to the RSA?</p> <p>Has Denison had discussions with the potential impacted Indigenous Nations and communities on how fear and avoidance behaviors and related impacts on traditional land use will be mitigated, especially within the RSA?</p> <p>Additional information is needed to determine if Denison has engaged directly with the Indigenous Nations and communities to develop potential mitigation measures to address fear and avoidance impacts, such as a community monitoring program, which could help to reduce the perceived risk to lands and resource use through education, collaboration, and long-term monitoring with Indigenous Nations, in order to build trust.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> It is recommended that Denison consider engaging with potentially impacted Indigenous Nations and communities on the collaborative development and implementation of a monitoring program to help address concerns about potential impacts on lands and resources as a result of the Project. The program(s) could help to monitor changes over time related the potential perceived risk of contamination of the land from Project activities and subsequent effects on the quality of fish, vegetation, and wildlife resources, which in turn could affect the safety of traditional foods and human health, and impacts on culture practices, and overall community well-being that travel to region yearly.</p>	Response is accepted, but also see AD-60 in the Advice to Proponent table.	Accepted	n/a
IR-208	-	CNSC	Indigenous physical and cultural heritage	Tables 11.1-3, 11.1-4 and 11.1-5 Section 11.1.3.2.6	<p><b>Context:</b> Black bear is listed as a species hunted by several Indigenous nations, including Pinehouse residents. CNSC participated in an in-person engagement with Pinehouse residents in October 2022 and bears eating waste was identified as a concern for hunting and consumption.</p>	Please specify measures that Denison will take to ensure bears and other animals do not scavenge from waste facilities. 					<b>Rationale:</b> Perceived risk of eating animals that are contaminated by hazardous or radiological wastes could deter community members from harvesting animals that are normally part of their traditional diet. Fencing for waste was specified as a deterrent for human trespassers, not animals.				
IR-209	-	CNSC	Indigenous Peoples' health / Socio-economic conditions	Section 12.1.4.2.1 (p. 12-22)  Section 12.1.5 Section 12.1.6.2	<b>Context:</b> KML indicates that working at a mine camp could inhibit community members from participating in cultural activities and sharing them with family and community members, resulting in a loss of cultural knowledge and language, thus impact knowledge transmission (p. 12-22).  <b>Rationale:</b> Denison addresses this by briefly identifying culturally sensitive policies which would eliminate residual effects (p. 12-30)	Please provide detailed proposed mitigation measure for KML's concerns related to loss of cultural knowledge and language should they work for Denison.		Accepted	n/a
IR-210	-	CNSC	Current use of lands and resources for traditional purposes	Section 12.1.4.2.2, Potential Effect 2: Change in Traditional Diet, Perceived Suitability of Country Foods (p. 12-26)	<b>Context:</b> The EIS states: “Project activities could change the perceived suitability of country foods. An ecological risk assessment (ERA) was conducted to consider both radiological and toxicological risks to ecological receptors such as terrestrial and aquatic invertebrates, terrestrial and aquatic vegetation, fish, and terrestrial and aquatic mammals and birds. Results for the radiological assessment predicted no exceedances of the radiation dose benchmark for the ecological receptors. For non-radiological COPCs, no exceedances were predicted except for selenium in fish from Russell Lake, based on a conservative dietary assumption for one resource user. The traditional foods diet for the fisher/trapper is conservative as it assumes that their annual fish consumption (183 kg of fish per year) would be obtained from Russell Lake, meaning the exceedance of the benchmark for selenium from fish would only occur if fish were only sourced from this one lake. This one exceedance could potentially change the perceived safety of country foods for community members and make country foods a less desirable part of a traditional diet.  <u>Experience from other uranium operations in northern Saskatchewan suggests that resource use will continue despite the potential selenium exceedance. An examination of members of the Hatchet Lake Denesųtiné First Nation who live in Wollaston Lake near the Rabbit Lake operation found that over years of being active on the landscape both with and without the presence of the uranium industry, members had developed their own culturally appropriate practice of risk assessment and management based on their relationship with the land. Hatchet Lake Denesųtiné First Nation members appear to be more concerned with the direct effects of uranium mining on the local environment and less concerned about uranium mining’s effects on their health through consumption of plants and animals. This is likely due to their high level of confidence in recognizing affected plants and wildlife and avoiding them (Elias et al. 1997).</u>  The usage patterns of the ERFN Trapper have similarly allowed for continued use and access to areas proximal to other uranium operations. The ERFN Trapper had a positive relationship with other uranium operations in the ILRU LSA. He also continued to trap (i.e., used his trapline in Fur Block N-18), fish, and opportunistically pick berries, and consumed those resources during operations (KPI Program 2021). Good relationships between Denison and a	Given concerns with psycho-social impacts and the influence of perception discussed by ERFN earlier on in the EIS, does Denison have information on the perspectives from Indigenous Nations and communities to validate this conclusion is applicable?		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>new trapper who eventually takes over the trapline from the ERFN Trapper would promote continued use.” (p. 12-26)</p> <p><b>Rationale:</b> The underlined reference suggests that negative perceptions may not prevent traditional resource users from continuing to consume, due to adaptation to potential risks in the environment.</p>				
IR-211	-	CNSC	Accidents and Malfunctions	Section 14.6.1, Bounding Scenario 1, Vehicle Accident and Aquatic Release of Radioactivity	<p><b>Context:</b> Scenario 1 describes a spill of uranium concentrate into the lake. It’s not clear how the ecological risk assessment was performed. It is stated that sediment concentrations in post-remediation conditions are expected to exceed the benthic invertebrate benchmark and that these results indicate that a spill of uranium concentrate could potentially affect benthic invertebrate populations following a spill, but the spatial extent would be limited. For water, it is stated that when evaluating the potential effect, a comparison was made between the results of the estimated short-term water quality 1,892 µg/L (1.892 mg/kg) and the guideline (33 µg/L). This indicates that there may be some aquatic species that could be affected, but the effects are expected to be transient as the water concertation quickly drops to a long-term level of 0.19 µg/L. However, when looking at dose to other receptors, the results of the ecological risk assessment indicated short-term ingestion of contaminated water resulting from an accident would not result in potential risks to grouse, vole, or deer, however rationale for how these receptors were chosen is not provided.</p> <p><b>Rationale:</b> It’s not clear from the EIS, why the receptors grouse, vole, and deer were chosen to evaluate ecological effects from a potential spill, and why they differ from receptors in the ERA. It is also not clear if the pathway from sediment ingestion/contact was considered for semi-aquatic receptors as they could be exposed to the increased concentrations post-spill. It is also not clear if SARA species exposure to sediment and water post-spill was considered.</p>	Please clarify why grouse, vole, and deer were chosen as receptors for the ecological risk assessment performed for accidents and malfunctions scenario 1 and clarify if the sediment pathway to receptors post-spill was considered, as well as if SARA species were considered. IR-212	-	HC	Human health with respect to hazardous contaminants	Section 14 (p. 14-3)  Appendix 16-C (p. 14 & 15)	<p>The follow-up plan does not sufficiently describe how various parties will be engaged in the design, implementation, and review of monitoring programs.</p> <p><b>Context:</b> Section 14 of the EIS states that “The overarching fear of contamination from the mine is woven in to almost every other concern noted by participants in the TK study. It is worth acknowledging this concern separately given the potential for mental health impacts related to people’s experiences of fear and anxiety” (p. 14- 3).</p> <p>The commitment regarding monitoring and follow-up activities appears limited to “<i>shar[ing] information in a transparent manner with the General Public, and specifically those Communities of Interest and Nearby Land Users with whom Denison is regularly engaging about the Project. Such an information-sharing program would consider the involvement of the Regulators to make sure the information available addresses the issues identified as concerns</i>” (p. 14).</p> <p><b>Rationale:</b> Country food safety is not regulated federally unless foods are sold</p>	<p>1. Provide details of how local, provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program.</p> <p>2. Describe the steps that will be taken if there are any exceedances of established benchmarks or deviation from predictions.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> Health Canada recommends that the Proponent’s plan for communicating follow-up results (environmental and country foods) aims at, among other things, responding to community concerns regarding country foods to minimize avoidance of this resource. This goes beyond a passive dissemination of information and developing a strategy based on dialogue and</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					commercially. Certain aspects of country food safety and availability may be covered by provincial regulators. It is unclear whether and how various levels of government and potentially affected communities would be involved in the development of the follow-up and monitoring program. It is also unclear what the information sharing program entails and how it would inform any adaptive management if monitoring results deviated from the prediction	the direct involvement of communities in monitoring, surveillance, and risk communication activities.			
IR-213	-	CNSC	Accidents and Malfunctions	Section 14.5.3 Appendix 14-A	<p><b>Context:</b> The Proponent states that the assessment of accidents and malfunctions began with the initial identification of hazard scenarios. Hazard scenarios were identified using a systematic approach that considered the existence of sources of hazards and initiating events for the Project in consideration of Project activities and components.</p> <p>The hazard identification was conducted to identify a comprehensive list of potential project-related accident and malfunction scenarios associated with the key project components and activities with further details provided in Appendix 14-A. The initial hazards were then screened qualitatively based on likelihood and consequence to determine overall risk level using a risk matrix approach. Bounding scenarios were then selected from this initial list of hazard scenarios.</p> <p>The results of numerical analyses (RESPEC, 2021) of detailed strip model suggest that the deformation imposed on the cemented steel casing from downward movement of the rock mass may exceed the assumed casing-strain yield limits and the failure limit locally after extracting the uranium ore. However, this potential hazard is not identified in the hazard identification.</p> <p><b>Rationale:</b> Exceedance of steel casing yield limits and failure limit would either compromise the steel casing integrity or damage the steel casing and result in the leakage of injected solution, which could impact on mine operation and contaminate the surrounding groundwater.</p>	Please include the hazard of steel casing yield or damage in the table of hazard identification evaluation and conduct an initial risk screening and further detailed assessment as required.		Accepted	n/a
IR-214	-	CNSC	Accidents and Malfunctions	Section 14.5.3 Appendix 14-A, section 3.2.3	<p><b>Context:</b> Hazard scenarios were identified using a systematic approach that considered the existence of sources of hazards and initiating events for the Project in consideration of Project activities and components. Details for how each of these project components and activities are considered in the initial hazard scenario identification process are provided in the accidents and malfunctions TSD (see Appendix 14-A; Ecometrix 2022).</p> <p>However, in Table 3-1 to Table 3-14 in Appendix A of Appendix 14-A, the following inconsistencies were identified:</p> <ul style="list-style-type: none"><li>i. consequences for the hazards ID# 1.1, 1.5, 1.7, 14.2 include occupational major injuries; however, the severity (S) is denoted as number 2 that appears to be inconsistent with consequence rating number in Figure 14.5-2</li><li>ii. Hazard ID# 1.5 has a L=2, but it is described as a highly unlikely event, which is inconsistent with the term in Figure 14.5-2</li><li>iii. Hazards ID# 3.6 and 3.7 have a L=1, but they are described as low probability event that is inconsistent with the term in Figure 14.5-2</li></ul>	Please clarify or correct all inconsistent and/or inaccurate information in Tables 3-1 to 3-14 in Appendix A of Appendix 14-A. 					<p>iv. Hazards ID# 8.2, 8.3, 9.1, 10.1 to 10.5, 11.1, 11.5 have a L=1, but they are described as unlikely events, which are inconsistent with the term in Figure 14.5-2. Rationale needs to be provided how stockpile erosion is considered to have a L=1</p> <p>v. Hazard ID# 12.1 has a L=2 and S=3, but it’s risk ranking is moderate, which is inconsistent with the term in Figure 14.5-2</p> <p>vi. Hazard ID# 13.3 has a L=2. Based on the operation experience in the similar projects in the northern Saskatchewan, ponds lining failure and leakage is a very likely event. Rationale needs to be provided to support L=2 or change the number for L.</p> <p><b>Rationale:</b> Inconsistent or inaccurate/incorrect information was included in Accidents and Malfunctions assessment.</p>				
IR-215	-	CNSC	Human health with respect to hazardous contaminants	Section 14.6	<p><b>Context:</b> One of the potential risks of a uranium mine and mill is a spill of untreated effluent.</p> <p><b>Rationale:</b> In the EIS, it doesn’t appear that the scenario of a spill of untreated effluent to the environment has been considered.</p> <p>A failure of the piping containing the untreated effluent could result in an uncontrolled release to the environment and could affect the groundwater, soil quality, and terrestrial biota.</p>	Please evaluate and provide the results for a bounding scenario of a spill of untreated effluent or provide justification for its exclusion.		Accepted	n/a
IR-216	-	CNSC	Human Health with respect to radiation exposure	Section 14.6.1 Section 14.6.7 Appendix 14-A	<p><b>Context:</b> Radiological doses to human receptors, including workers (i.e., driver(s) of the vehicles), from the Bounding Scenarios 1 (Vehicle Accident Including Rollover, Collision, Run Off Road) and 7 (Vehicle Accident Including Rollover, Collision, Run Off Road) have not been assessed.</p> <p><b>Rationale:</b> An estimate of the effective doses to human receptors, including workers, are required to determine whether the expected doses meet the dose limits set out in the Radiation Protection Regulations.</p>	Provide estimates (including calculations) of the potential radiological doses to human receptors, including workers, resulting from Bounding Scenarios 1 and 7.		Accepted	n/a
IR-217	-	CNSC	Accidents and Malfunctions	Sections 14.6.1 and 14.6.2	<p><b>Context:</b> Highway 914 crosses the Wheeler River 10 km southwest of the access road junction. A vehicle accident, including a rollover, collision, or run off road, at or near the bridge could potentially result in a release of uranium concentrate and release of fuels and chemicals into the surface water at this location. Denison believes that a release of uranium concentrate and a release of fuels and chemicals at this location would bound the releases at any other water crossing along the transportation corridor. However, no information on what other water crossings along the transportation corridor exist and how bounding scenarios 1 and 2 would bound the risk of releasing uranium concentrate and fuels and chemicals at other crossings.</p> <p><b>Rationale:</b> The release of uranium concentrate and fuels and chemicals at water crossings would contaminate the water body at the crossings and pose a risk to the environment and public health.</p>	Please provide information on all water crossings along the transportation corridor and justification why bounding scenarios 1 and 2 would bound the effects of the accidental releases of uranium concentrate and fuels and chemicals at these crossings.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-218	-	CNSC	Accidents and Malfunctions	Sections 14.6.1.1 and 14.6.1.4	<p><b>Context:</b> Table 14.6-1 indicates that the average flow of Wheeler River south of Russel Lake is 17,340 L/s or 17.34 m3/s. This rate is used for uranium dissolution rate calculation. However, in section 14.6.1.4, it states that the average annual flow is 24.3 m3/s. In Table 14.6-3, the last two rows appear to be added wrongly.</p> <p>It also states that sediment quality results are shown in Table 14.6-5 for post-remediation conditions. During minimum flow conditions, the affected volume is expected to be smaller, resulting in a higher sediment concentration. In comparison, higher flow conditions are expected to result in a greater footprint and lower concentrations. However, in Table 14.6-5, the average sediments concentration and porewater concentration appear to be incorrect and switched between average flow and maximum flow.</p> <p><b>Rationale:</b> Inconsistent/inaccurate information provided in the EIS.</p>	Please clarify and correct the inconsistent information on average flow rate of Wheeler River at the crossing and incorrect information in Table 14.6-3, and average sediment concentration and porewater concentration under average and maximum flow conditions in Table 14.6-5.		Accepted	n/a
IR-219	-	CNSC	Accidents and Malfunctions	Sections 14.6.1.1.1 and 14.6.1.4.1;  Sections 5.1.1 and 8.1 of Appendix 14-A	<p><b>Context:</b> When assessing the release characterization of Bounding Scenario 1, the Proponent assumed that 95% of the released uranium concentrate can be recovered from the release location without sufficient justification, and that different water column depths, i.e., 10 cm and 5 cm, and average water depth of 1.2 m at the release location were used without explanation.</p> <p><b>Rationale:</b> As the recovery rate of the uranium concentrate would have an impact on the assessment of its potential effects, it is necessary to understand how the recovery rate and water level were selected for assessing this bounding scenario.</p>	Provide further rationale for assuming 95% recovery rate and for using different water column depths for uranium concentrate release characterization.		Accepted	n/a
IR-220	-	CNSC	Accidents and Malfunctions	Section 14.6.1.1.1  Appendix 14-A, Section 5.1.1	<p><b>Context:</b> The Proponent states that based on drum deformations performed in a previous analysis (McSweeney et al. 2004), if a drum experienced a crush force of 100,000 lbs., then the deformation of the drum would cause the lid to detach from the drum. Using this drum failure mechanism, and assuming the drums weigh 450 kg and are arranged four across in the truck, at a speed of 48 km/h, the front 25% of the drums would fail, at 60 km/h to 97 km/h 55% would fail, at 145 km/h 75% would fail, and at ≥193 km/h all would fail. Given that the speed of the truck is likely between 60 km/h to 97 km/h, it was concluded that less than 55% of the drums would fail upon a traffic accident scenario.</p> <p>It is assumed to be 40 drums per shipment, so some stacking or rows of drums should be expected in this scenario. The drums stacked above could be at greater risk of deformation in a traffic accident. It is not clear whether drums stacking was considered in the previous study cited by the Proponent and whether less than 55% fail is still an adequate percentage of drum failures in such traffic accident scenarios if drums stacking is needed.</p> <p><b>Rationale:</b> Drum failure percentage will impact the release quantity of uranium in such an accident scenario and then impact the consequence assessment. Therefore, the drum failure should be adequately assessed and supported with sufficient information and justification.</p>	Please provide information and/or rationale as to whether drum stacking would impact drum failure at different speeds and confirm whether 55% drum fail for such an accident is still valid.		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-221	-	CNSC	Accidents and Malfunctions	Section 14.6.1.3,  Appendix 14-A, Section 7.1	<b>Context:</b> It is projected that there would be about 100 drums packaged per mill operating day. One trip per day for 330 days per year is assumed for the probability evaluation. This means 100 drums per trip, which is inconsistent with description in section 14.6.1.1.1 where assuming 40 drums in one shipment per day.  <b>Rationale:</b> Shipments per day will impact the probability evaluation, and number of drums per trip will impact the release of uranium during an accident.	Please clarify the number of shipments per day and number of drums per shipment that are expected and re-calculate the probability as necessary.		Accepted	n/a
IR-222	-	CNSC	Accidents and Malfunctions	Section 14.6.2.4	<b>Context:</b> Bounding Scenario 2 consists of the aquatic release of fuel and hazardous chemicals due to traffic accidents. The EIS states that amongst the fuels considered for this scenario, the consequences of the release of gasoline and solvents are bounded by the consequences associated with the release of diesel. Both gasoline and solvents are lighter with higher vapour pressure; therefore, they have a shorter half-life in the aquatic environment and a lesser tendency for adsorption to sediments and suspended solids in the water column. There is no other justification provided to show that the release of diesel can bound other chemicals such as sulfuric acid and sodium hydroxide that are heavier than diesel.  <b>Rationale:</b> The release of either sulfuric acid or sodium hydroxide during accident could change the water PH significantly at the releasing location, which would post a negative impact on the local environment.	Please provide further justification that the consequences of the release of sulfuric acid and sodium hydroxide can be bounded by the consequences associated with the release of diesel.		Accepted	n/a
IR-223	-	CNSC	Accidents and Malfunctions	Section 14.6.4.1  Appendix 7-A, Appendix K	<b>Context:</b> The EIS states that the 3D strip numerical model predicted that stresses and displacements did not show instability in the altered sandstone or basement rock at the location where a freeze wall would be placed around the Phoenix Deposit boundary (RESPEC 2021). The potential damage to the freeze wall due to mine-induced stresses and displacements under this scenario is excluded.  <b>Rationale:</b> One outer section of the freeze wall (i.e., north-east freeze wall of the phase 4 mining area) and some internal cross walls are located in the desilicified zone. The RESPEC 2021 report (i.e., Appendix K of Appendix 7-A) appears not to have included the desilicified zone in the geomechanical modeling, nor is provided the stresses and the displacements/deformation of the area northeast of the phase 4 ore body where a significant extent of the desilicified zone exists.	Please provide information on the stresses and displacements/deformation of the area northeast of the phase 4 ore body from the geomechanical studies to demonstrate the resulted stresses and displacements will not impact on the freeze wall integrity after IRs for geomechanical studies for ore extraction are addressed.  <b>Technical Discussion Required:</b> Yes		Accepted	n/a
IR-224	-	CNSC	Human Health with respect to radiation exposure	Section 14.6.5.4  Appendix 14-A	<b>Context:</b> For the Bounding Scenario 5 (Process System and Piping Failure), doses to receptors at distances of 100 and 500 metres (0.25 and 0.01 mSv respectively) are predicted. The assessment also indicated that the dose to the unprotected worker staying inside the processing plant during the spill could exceed the 50 mSv dose limit specified by CNSC if workers did not leave the area quickly after the spill.  The Proponent did not provide the dose calculations for deriving the dose estimates.  <b>Rationale:</b> The method used to estimate effective, equivalent, and committed dose	Provide the dose calculations for deriving the dose estimates for workers and members of the public for Bounding Scenario 5 (Process System and Piping Failure). 					have worker fatality. The severity of the consequences of an explosion would be catastrophic and the risk of Bounding Scenario 6 would be higher.				
IR-232	-	ECCC	Change to an environmental component due to hazardous contaminants	Appendix 14-A, Table 3-7, ID# 7.1  Appendix 14-A, Table 5-5	<p><b>Context:</b> The Proponent indicates in Appendix 14-A, Table 3-7 that a release of sulfuric acid is a low consequence event therefore would not require further assessment. However, according to a Safety Datasheet on high concentrated sulfuric acid (ICSC–0362 - SULFURIC ACID, concentrated (&gt; 51% and &lt; 100%) (ilo.org)), the substance is incompatible with certain materials and can give off toxic fumes. Furthermore, it reacts with various metals to produce hydrogen gas, which is explosive.</p> <p>The Proponent provides estimates of chemicals, including sulfuric acid, to be transported to site in Appendix 14-A, Table 5-5. The annual consumption of sulfuric acid is estimated at 15,417 m3, in 617 trucks per year, but the concentration is not stated.</p> <p><b>Rationale:</b> Given the high reactivity and inherent corrosive nature of sulfuric acid combined with the volume and concentration that may be stored on site, ECCC requests that the Proponent provide a detailed risk assessment related to a terrestrial spill of sulfuric acid, specifically at the processing plant.</p>	1. Provide the volume and the concentration of sulfuric acid that will be stored on site.  2. Provide a detailed risk assessment of the fate and behavior of sulfuric acid during a release into the environment.		Accepted	n/a
IR-233	-	HC	Human health with respect to hazardous contaminants	Appendix 14-A, Section 8.7 (p. 8.10)	<p>An effects assessment for a transportation accident scenario involving radioactive materials was not included.</p> <p><b>Context:</b> The Proponent provided an effects assessment relating to a diesel spill on the ground (Section 14 Appendix 14-A, Section 8.7). However, no information was provided regarding the potential human health effects of a uranium concentrate release at the two locations considered (Section 14 Appendix 14-A p. 8.10).</p> <p><b>Rationale:</b> An accident involving radioactive material may have an impact on human receptors, based on the proximity of receptors and the proposed response protocols.</p>	1. Assess and describe the potential health effects (chemical and radiological) of a transportation accident involving a uranium concentrate spill at the following locations: a) km 160 of Hwy 914, which is the location of a cultural camp that has been established by the ERFN. b) km 67 of Hwy 914, which is a gathering location for the Kineepik Métis Local associated with the Northern Village of Pinehouse. c) All other potential sites of importance for the public and Indigenous peoples.		Accepted	n/a
IR-234		CNSC	Effect of Environment	Section 15.2.2	<p><b>Context:</b> Effects of seismic events on the uranium extraction and post decommissioning are not assessed.</p> <p><b>Rationale:</b> Seismic events could further exacerbate the stability of the voids induced by the uranium extraction, which will result in extra stresses and displacements/deformation in the overlying rock formations. These extra stresses and displacements/deformation could impact on the mine operation and post decommissioning groundwater flow and contaminant transport.</p>	Please provide an assessment of seismic events on the mine-induced voids stability and the resulted effects on the mine operation and post decommissioning.  <b>Technical Discussion Required:</b> Yes		Accepted	n/a
IR-235	-	ECCC  CNSC	Fish and fish habitat	Section 15.5.2, Expected Environmental Conditions	<p><b>Context:</b> In this section it is stated that: “Table 15.5-1 and Table 15.5-2 summarize the predicted mean values of the climate variables for the Tomblin Lake regional grid unit, following the RPC4.5 and RCP8.5 scenarios, respectively, as indicated by the Climate Atlas (PCC 2019).”</p> <p>RCP4.5 represents predicted climate conditions of a moderate carbon future.</p>	1. Provide the source of the data displayed in Max 1-Day Precipitation (mm) category in Tables 15.5.1 and 15.5-2.  2. Provide detailed calculations for the following average values:		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
					<p>RCP8.5 represents predicted climate conditions under a high carbon future.</p> <p>The values shown in Tables 15.5-1 and 15.5-2 show averages of 25.9 and 26.7 mm for RCP4.5 and 25.9/27.5 mm for RCP8.5. These values do not correspond to the source indicated by the Proponent.</p> <p><b>Rationale:</b> Based on the Proponent’s description we would expect to find the same values for “Max 1-Day Precipitation (mm)”in the Climate Atlas for RCP4.5 and RCP8.5 scenarios. ECCC was unable to duplicate the results.</p> <p>ECCC queried the Climate Atlas for Tomblin Lake and returned a result of “Region Geikie River.” <a href="https://climateatlas.ca/find-local-data">https://climateatlas.ca/find-local-data</a></p> <p>ECCC then queried the Climate Atlas for Max 1 Day Precipitation (mm). <a href="https://climateatlas.ca/data/grid/782/maxdaypr_2030_85/line">https://climateatlas.ca/data/grid/782/maxdaypr_2030_85/line</a> <a href="https://climateatlas.ca/data/grid/782/maxdaypr_2030_45/line">https://climateatlas.ca/data/grid/782/maxdaypr_2030_45/line</a> The results displayed an array of values ranging from 83.6 mm (2050) to 87.3mm (2092) for a Regional Concentration Pathway RCP8.5 scenario and values ranging from 48.9mm (2050) to 89.5 mm (2083) for an RCP4.5 scenario.</p> <p>These values do not match the averages shown in Tables 15.5-1 and 15.5-2.</p>	<ul style="list-style-type: none"><li>25.9 mm 26.7 mm in Table 15.5-1: Predicted Climate Conditions of a RCP4.5 Moderate Carbon Future</li><li>25.9 mm 27.5 mm in Table 15.5-2: Predicted Climate Conditions of a RCP8.5 High Carbon Future</li></ul> <p>3. Explain how the data shown in Tables 15.5.1 and 15.5.2 were used in the precipitation risk assessment.</p> <p>4. Denote the differences between “mean”, “value/max value”, and “fluctuation”, in the calculation of extreme event risk.</p> <p>5. Compare model derived data against:</p> <ol style="list-style-type: none"><li>Natural variability of the observed data.</li><li>Variability in the statistics generated via observation based time series.</li></ol> <p><b>Technical Discussion Required:</b> Yes</p>			
IR 236	-	ECCC ERAD	Fish and fish habitat	Section 15.5.2, Expected Environmental Conditions	<p><b>Context:</b> It is stated that, “Table 15.5-1 and Table 15.5-2 summarize the predicted mean values of the climate variables for the Tomblin Lake regional grid unit...”</p> <p>As per the Proponent’s description, Tomblin Lake was chosen as representative location for Wheeler when Climate Atlas was used as data source.</p> <p><b>Rationale:</b> In those two tables, for the “Max 1-Day Precipitation (mm)” the historical average is given as 24.1mm. Local time series analysis for the climatic region in which Wheeler Project is located provide averages (for 1-day max precipitation) of approximately 30+ mm.</p> <p>It is the Proponent’s responsibility to keep the required database current and up to date, because the length of the time series influences all derived statistics. Statistical analysis of extreme events is highly dependent of the mean with extreme values reaching values 3 to 4 times higher than the mean.</p>	<p>1. Provide a clear explanation on how the historical mean for 1-Day Max Precipitation was calculated.</p> <p>2. Compare the values obtained via various means (ex: copied from the internet, modeled via some online algorithm, derived from specialty literature), against time series analysis based on observations.</p> <p><b>Technical Discussion Required:</b> Yes</p>		Accepted	n/a

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale (March 2023)	Information Requirement (IR) (March 2023)	Rationale for Status (October 2024)	Status	Denison Response to CNSC Comments, October 18, 2024
IR-237		CNSC	EA follow-up and monitoring program	Appendix 16-C throughout, including Table 1.5-1: Wheeler River Monitoring and Follow-up Program Summary (p. 8-15)	<p><b>Context:</b> CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> state: “The EIS should provide discussion on the follow-up program’s requirements, and include:</p> <ul style="list-style-type: none"><li>objectives and structure of the follow-up program and the VCs targeted by the program</li><li>tabular summary and explanatory text of the main components of the program including:<ul style="list-style-type: none"><li>a description of each monitoring activity under that component</li><li><u>which of the two generic program objectives the activity is relevant to (e.g., verify EA predictions, determine effectiveness of mitigation measures)</u></li><li>the specific statement from the EA that goes along with that generic objective and will be the focus for that activity (e.g., program objective: verify predicted effects; environmental assessment effect: no potential adverse effects)</li><li>the specific monitoring objective for that activity</li><li>planned schedule</li></ul></li><li><u>roles and responsibilities to be played by the Proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the program results</u></li><li><u>possible involvement of independent researchers</u></li><li><u>program funding sources</u></li><li>information management and reporting (reporting frequency, methods and format)</li><li><u>possible opportunities for the Proponent to include the participation of the public and Indigenous groups, during the development and implementation of the program</u></li></ul> <p><u>The follow-up program plan should be sufficiently described in the EIS to allow independent judgment as to the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures.”</u> (Section 11)</p> <p><b>Rationale:</b> The Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information, and while some of the aspects detailed in the Generic EIS Guidelines are included, the aspects underlined are missing or appear incomplete.</p> <p>Further, all information from throughout the EIS should be incorporated into this Summary. For example, the EIS notes that: “Groundwater samples will be collected at least monthly and semi-annually in the wells within the freeze wall and on the freeze wall perimeter, respectively” (p. 7-109) and that “At least five to seven multi-well clusters are proposed across the mined area (Figure 7.8-2). Sampling will include KI parameters or the full suite of COPC at different times in the remediation process” (p. 7-111).</p> <p>These details (only examples) are not included in Appendix 16-C.</p>	<p>It is recognized that this document will evolve over the planning process and be finalized prior to the EA Decision; however, as plans are developed and revised, CNSC staff expect that updates will be made to this document and provided with any future versions of the EIS.</p> <p>Appendix 16-C Summary of Monitoring and Follow-up Programs must include sufficient details to allow CNSC staff to determine the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures. This includes concrete monitoring plans (sampling locations, frequency, etc.).</p> <p>Additionally, please incorporate any relevant information included in the EIS into this Summary.</p>		Accepted	n/a

**Additional Lung Cancer Mortality from PM2.5: Recommended Approach and Sample Calculation**  
Health Canada, Water and Air Quality Bureau, October 2022

Health Canada (2022) provides a quantitative estimate of the risk of lung cancer associated with exposure to PM2.5 in Canada. The pooled hazard ratio (HR) for lung cancer mortality in the Canadian population is 1.127 (95% CI: 1.085, 1.170) per 10 µg/m3 increase in long-term exposure to ambient PM2.5. The slope coefficient (β) for this relationship is 0.01196, as derived below:

$$e^{(\beta \times 10 \text{ }\mu\text{g}/\text{m}^3)} = \textit{pooled hazard ratio per 10 }\mu\text{g}/\text{m}^3$$
$$e^{(\beta \times 10 \text{ }\mu\text{g}/\text{m}^3)} = 1.127$$
$$\beta \times 10 \text{ }\mu\text{g}/\text{m}^3 = \ln 1.127$$
$$\beta = (\ln 1.127)/(10 \text{ }\mu\text{g}/\text{m}^3) \text{ `}$$
$$\beta = 0.01196$$

The additional lung cancer mortality (over the baseline rate) from PM2.5 derived from a given source can be determined using the equation below, based on the attributable fraction or (HR-1)/HR (Greco et al. 2020):

$$ALCM = \left[ \frac{\left( e^{\beta \cdot Exposure} - 1 \right)}{e^{\beta \cdot Exposure}} \right] \cdot Baseline \text{ rate} \cdot Years$$

ALCM = additional lung cancer mortality cases per 100,000 population

β = 0.01196 (slope coefficient from meta-analysis in Health Canada (2022))

Exposure = estimated PM2.5 exposure concentration from the relevant source(s) (µg/m3) (does not include baseline PM2.5 exposure)

Baseline rate = 45.5 per 100,000 (current Canadian Age Standardized Mortality Rate (ASMR) for lung cancer from Canadian Cancer Statistics Advisory Committee 2021); the Canadian baseline rate is appropriate as the slope coefficient was derived from Canada-wide studies and an updated ASMR of Canada (if available) would be appropriate for use in the calculation

Years = years of project or project phase

Sample calculation:

Project estimates an exposure from relevant source(s) of 0.067 µg/m3 over 50 years of operation

$$ALCM = \left[ \left( e^{\beta \cdot Exposure} - 1 \right) / e^{\beta \cdot Exposure} \right] \cdot Baseline\ rate \cdot Years$$

$$ALCM = \left[ \left( e^{0.01196 \cdot 0.067} - 1 \right) / e^{0.01196 \cdot 0.067} \right] \cdot 45.5 \cdot 50$$

ALCM = 1.8 additional lung cancer mortality cases per 100,000

November 13, 2024

Nana Kwamena  
Canadian Nuclear Safety Commission  
Government of Canada  
280 Slater Street  
Ottawa, ON K1P 5S9

Dear Ms. Kwamena,

**Re: Wheeler River Project Federal Indigenous Review Round 4 Follow-up  
Clarifications for Information Requests 114 & 174**

During a November 8, 2024 discussion between the Canadian Nuclear Safety Commission (CNSC) and Denison (Kwamena - Switzer), and a subsequent discussion between the CNSC and Denison (Way-England) on November 12, 2024, the CNSC requested further information on two of Denison's Round 4 responses. Specifically, the CNSC requested Denison clarify whether the responses to Information Request (IR) 114 and 174 would alter the conclusions of the assessment. Denison confirms that the information provided in the response to these two IRs did not change the conclusions of the Environmental Impact Statement (EIS).

The enclosed memo provides further clarification in support of Denison's determination. Minor updates that have been made to the final EIS (October 2024), as part of Denison's response to the aforementioned IRs, have been noted in the memo.

Kindly,

Janna Switzer  
Vice President, Environment Sustainability & Regulatory  
Denison Mines

Cc Jessica Way (CNSC)  
Brianne England (Denison)

**Wheeler River Project Environmental Impact Statement (EIS)**  
**Round 4 Information Requests (IRs) 114 and 174 consideration of conclusions**  
**November 13, 2024**

---

IR-114

For reference, we note that the nature of IR-114 has changed over the two-year review period. Initially the primary focus of IR-114 concerned inclusion of Metal and Diamond Mining Effluent Regulations (MDMER) parameters, the use of baseline receiving environment concentrations to derive water quality thresholds, and data and analysis for mercury / methyl mercury. The use of the copper (Cu) federal environmental quality guideline (FEQG), that is now the focus of IR-114, was raised by the federal-Indigenous review team (FIRT) in the draft Round 4 comments received by Denison in September 2024.

In response to Round 4 IR comments, the EIS technical team updated the EIS (final EIS; October 2024) as described in the following bullet points. Discussion regarding the updates is also provided for context and clarity:

- The changes requested to **Section 8 Aquatic Environment** were made. This includes corrections/revisions to table footnotes, removal of MDMER effluent limits for arsenic and total suspended solids as short-term screening criteria, and the inclusion of the Cu FEQG in the assessment. The following is noted regarding the Cu FEQG in particular as this seemed to be the most salient issue raised in the IR, specifically related to the calculation of the Cu FEQG. At baseline and reference conditions, the FEQG was calculated to be 0.0002 mg/L. When evaluating results predicted during operations, the FEQG was calculated in consideration to the toxicity modifying influence of the effluent – that is, the FEQG was calculated using the BLM model in consideration of the effluent-induced hardness in the receiver and the value of 0.00098 mg/L was used. As noted in the Round 4 response to this IR, Denison and its SMEs believe it is relevant to consider all aspects of the receiving environment and this includes induced hardness since the scenario being evaluated only occurs during periods of effluent discharge. This approach is used in other jurisdictions (e.g., water licences in northern Canada issued through local water boards) and therefore the concept of utilizing induced toxicity modifiers, like hardness, that would be associated with the receiving environment is not unique.

With the above in mind, the results show no exceedances of the adjust Cu water quality guideline as defined by the BLM derived FEQG in the operations phase during periods of effluent discharge. In consideration of this there is no rationale on which to change the conclusion of the EIS. Text has been added to the EIS documentation (see below regarding Appendix 10-A) that considers the FEQG reflecting baseline and reference conditions from a sensitivity analysis perspective which Denison and its SMEs believe is an appropriate treatment of the information. The sensitivity acknowledges the perceived increased risk to aquatic biota at the lower, baseline FEQG since the predicted copper concentration is greater than the FEQG; however, this sensitivity analysis does not require a change to the overall conclusions of the EIS.

## Wheeler River Project Environmental Impact Statement (EIS)

### Round 4 Information Requests (IRs) 114 and 174 consideration of conclusions

November 13, 2024

---

- Additionally, the following is noted:
  - The Surface Water Quality valued component (VC) is an intermediate VC, where a change in an intermediate VC has the potential to result in an effect on a receptor VC and receptor VCs are generally biological or integrated assessment endpoints. Significance determination is not completed on intermediate VCs, but integrated into the residual effect evaluation, residual effect characterization, and significance determination for related receptor VCs.
  - If a water quality guideline is exceeded, this does not directly correspond to an effect on receptor VCs or a significant effect on a receptor VC. A close review of Section 8 residual effect analysis was conducted. This included a review of the ratings for residual effect characteristics: direction, magnitude, geographic extent, duration, frequency, reversibility, context, and likelihood for aquatic environment VCs. The information contained in the revised draft EIS was acceptable, and it was determined that no updates to the assessment conclusions were required with the inclusion of the Cu FEQG. While some additional risk to sensitive receptors is possible, the overall integrity of the VC populations within the aquatic regional study area is unlikely to be changed.
  - The assessment is conservative on many fronts, and one of the central issues with copper is that the analytical lab's detection limit for surface water sample was at the background FEQG of 0.0002 mg/L. Additional surface water sampling with a lower detection limit was initiated in 2024 and will provide a more accurate value for baseline copper concentrations. Denison's commitment to collect more water samples prior to construction and incorporate new water quality data into Denison's application for a licence to operate, along with updated effluent quality data, in outlined in commitment 8-48. The conceptual environmental sampling plan for aquatic environment VCs included in the EIS is at the appropriate level of detail needed at the environmental assessment (EA) stage and does not need to be updated because of this IR.
- **Appendix 8-E Constituent Concentrations and Mixing Zone Assessment Report** has been updated to be consistent with the revisions to Section 8 described above, e.g., updating table footnotes, removing MDMER effluent limits as short-term screening criteria for arsenic and total suspended solids, and including the copper FEQG as appropriate.
- **Appendix 10-A Environmental Risk Assessment** a new section 6.2.4 *Copper Aquatic Toxicity Reference Values* was added to Appendix 10-A, Section 6.2 Sensitivity Analysis. The content of this new section is effectively the information provided to the CNSC in Attachment IR-114 Round 4.

**Wheeler River Project Environmental Impact Statement (EIS)**  
**Round 4 Information Requests (IRs) 114 and 174 consideration of conclusions**  
**November 13, 2024**

---

IR-174

For reference the following is noted with respect to the chronology and evolution of IR-174 for context. This IR was “not accepted” in the draft, Round 4 IRs provided to Denison in September; however, in the October 2024 version of the Round 4 IRs, this IR was deemed to be “under discussion.”

Despite this change in status, Denison nevertheless included a detailed response to IR-174 in the October 18, 2024, IR response package to address the specific comments contained in the draft IR-174 Round 4.

As part of Denison’s response to this Round 4 IR, clarification on data provided in the baseline bat detection map legend was provided and this was updated in the final EIS (October 2024) in Figure 2.9 of Appendix 9-F, methodology for future pre-construction baseline bat survey was provided, and commitment 9-37 was updated as requested.

The results of bat surveys (acoustic) completed in 2024 were provided to the CNSC (OMNIA memo dated October 29, 2024). Four bat species or species groups were detected during the surveys: little brown myotis (*Myotis lucifugus*), northern myotis (*M. septentrionalis*), hoary bat (*Lasiurus cinereus*), and western small-footed bat (*M. ciliolabrum*). Hoary bat and western small-footed bats were not detected during the 2019 acoustic survey.

The detection of different or additional bat species has no implications on the EIS baseline report (Appendix 9-B). The baseline report is an inventory of species detected during the focused surveys completed to support the EIS and reflects the information gathered to the date of publication; the OMNIA memo included with the IR response is now part of the EIS record and therefore the record includes documentation of all species encountered. The assessment and conclusions surrounding bat species in Appendix 9-D are unchanged in consideration of the results of the 2024 acoustic surveys and the reasoning for this is discussed below.

The assessment provided for bat species focussed on bat species at risk (SAR) including northern myotis and little brown myotis. The assessment is provided in Appendix 9-D and follows an accepted habitat-based assessment. The information provided in Appendix 9-D includes a summary of the life history requirements, the expected Project effects, proposed mitigation measures (including project design measures, general mitigations for wildlife SAR, and species-specific measures for bat species), and anticipated residual effects on those species. Since the hoary and western small-footed bats occupy the same ecological niche and have similar life histories to northern myotis and little brown myotis, the information provided in Appendix 9-D applies equally to them (and all bat species with similar life histories and niche requirements), including the conclusions of the assessment. With that in mind, Denison and its SMEs do not have a rationale to alter the EIS conclusions in this regard.

**Wheeler River Project Environmental Impact Statement (EIS)**  
**Round 4 Information Requests (IRs) 114 and 174 consideration of conclusions**  
**November 13, 2024**

---

The above rationale is consistent with typical EA practice. The EIS was not designed to include an assessment of every species that has been detected at a given Project site, nor is such an assessment necessary considering the EA methodology used for the EIS. Scoping is completed to focus the assessment on key VCs, and this is considered EA best practice. This approach is outlined in within the EIS documentation, including Section 5 Approach and Methodology of the Assessment and Section 9 Terrestrial Environment.

**November 19, 2024**

**Wheeler River Project Environmental Impact Statement Review**

**Denison's Response to the CNSC's November 14, 2024 comment Round 5 IR-114**

**CNSC Round 5 IR-114 comment**

1. Update EA commitment 8-47 to include a linkage to IR-114 to ensure that additional sampling for alkalinity and nitrate will be conducted prior to construction activities as supporting information for IR-114, as indicated by Denison in their Round 4 responses.
2. Provide an updated Table 8.2-13 for review incorporating the correct short- and long-term benchmark values of 0.00011 mg/L and 0.00004 mg/L respectively, for Cadmium.
3. Provide an update to the ERA risk conclusions to remove reference to utilizing an "induced hardness" scenario calculating a copper FEQG with effluent concentrations of hardness (i.e. 250 mg/L) rather than the maximum predicted receiving environment concentrations of hardness (i.e. 9 mg/L as per EIS Table 8.2-10) as rationale for risk to receptors.
4. Confirm, in light of this new information, with appropriate justification, whether the EA predictions and conclusions remain valid, and whether the proposed mitigation measures remain adequate.
5. Make a commitment to assess and minimize copper concentrations in effluent through the BATEA assessment during licensing.

**Denison's response – to be considered in conjunction with the IR-114 responses provided to the CNSC on October 18, 2024 and November 13, 2024**

1. *Note: commitment 8-47 was a commitment related to wetlands. Commitment 8-48 has been updated in commitments register version 4 as shown here in track changes:*

ID (EIS Section-chronological number)	VC/KI (as applicable; related to mitigations)	Last Updated (register version)	Details of Commitment	EIS Section or IR/TRC	Project Phase	Commitment Tracker Method	Scope of Commitment
			methylmercury, and other relevant COPCs such as lead, arsenic, and cadmium as part of the constituents monitored in fish throughout all project phases.				
8-45	Water Quality / Project Description	1	Denison is committed to investigating BATEA and working with the province and CNSC to ensure discharge concentrations of all constituents including uranium are protective of the aquatic environment.	IR-18	All phases	Engineering Design; EMS; EA Follow-up Program	Regulatory Requirement
8-46	Wetlands / Fish Habitat	1	To further supplement existing information that exists for the LSA wetlands, Denison is committed to undertaking wetland surveys including the collection of water quality, sediment quality, benthic invertebrates and fish and fish habitat surveys prior to the construction to provide an updated baseline for assessing the success of mitigation measures and to assess potential effects of the project on wetlands. These locations will then be further considered as part of the EMP for continued monitoring for these media and biota.	IR-101, Appendix 8-F	All phases	Engineering Design; EMS; EA Follow-up Program	FUP Requirement
8-47	Wetlands/Fish Habitat	1	Wherever possible, wetlands will be avoided through Project design and instituting proper buffers.	IR-101, Section 8.3.5, Appendix 8-F	All phases	Engineering Design	Regulatory Requirement

2. Excerpt of Final EIS (October 2024) Table 8.2-13 for the CNSC's review of cadmium screening criteria:

**Table 8.2-13: Maximum Concentration of Surface Water Constituents of Potential Concern in Surface Water**

Constituent	Unit	Kratchkowsky Lake (LA-7)	Whitefish Lake North (LA-6)	Whitefish Lake Middle (LA-5 North)	Whitefish Lake South (LA-5 South)	McGowan Lake (LA-1)	Icelander River	Russell Lake Inlet	Short-term Benchmark			Long-term Benchmark		
									Value	Reference	Notes	Value	Reference	Notes
Alkalinity	mg/L	NE	NE	12.4	12.4	NE	NE	NE						
Aluminum	mg/L	0.01766	0.01616	0.01835	0.02226	0.01500	0.01499	0.01614				0.1	SEQG/CCME	(1)
Ammonia (as N)	mg/L	0.01463	0.01463	0.05232	0.05215	0.03978	0.0395	0.03368				5.74	SEQG/CCME	(2)
Un-ionized Ammonia	mg/L	0.0000086	0.0000086	0.0000309	0.0000308	0.0000235	0.0000233	0.0000199				0.019	SEQG/CCME	
Arsenic	mg/L	0.00012	0.00011	0.00015	0.00015	0.00013	0.00013	0.00012				0.005	SEQG/CCME	
Cadmium	mg/L	0.000024	0.000023	0.00004	0.000039	0.000033	0.000033	0.00003	0.00011	CCME	(3)	0.00004	SEQG/CCME	

(3) Cadmium criteria based on water hardness of >0 to <5.3 mg/L (Site-specific background hardness is 5.26 mg/L [95th percentile of LA-5 and LA-6]).

3. and 4.

Baseline conditions for the Wheeler River include a background hardness of 5.26 mg/L, DOC of 2.24 mg/L, and pH of 6.61 (95th percentile of LA-5 and LA-6). Using ECCC's Biotic Ligand Model for copper, the calculated  $HC_5$  is below 0.0002 mg/L, however, 0.0002 mg/L is considered by the FEQG to be the lowest concentration routinely measured and therefore replaces the calculated  $HC_5$  value for this water chemistry. Therefore, at baseline conditions the FEQG is 0.0002 mg/L. Table 3-1, Table 3-3, and Table 3-5 of the ERA (Appendix 10-A) were updated to include the copper FEQG of 0.0002 mg/L as the screening criterion.

As identified in Section 5.3.1.1 of the ERA (Appendix 10-A), toxicity reference values (TRVs) for copper were obtained from the USEPA Ecotoxicology Database (ECOTOX) for aquatic organisms. The selected TRVs were 20% Effect Concentrations (i.e.,  $EC_{20}$  values), which are concentrations at which only 20% of the test organisms respond. The TRVs are shown in Table IR-114-1 below. Where the TRVs derived from ECOTOX were lower than the CCME guideline the CCME guideline was selected.

**Table IR-114-1: Copper Toxicity Reference Values Used for Aquatic Organisms in the ERA**

COPC	Biotic Group	TRV	Unit	Rationale	Data Source
Copper	Forage fish	0.002	mg/L	5th percentile of estimated chronic $EC_{20}$ distribution (n=237)	ECOTOX
	Predator fish	0.003	mg/L	5th percentile of estimated chronic $EC_{20}$ distribution (n=89)	ECOTOX
	Zooplankton	0.002	mg/L	5th percentile of estimated chronic $EC_{20}$ distribution (n=117)	ECOTOX; CCME
	Benthic invertebrates	0.002	mg/L	5th percentile of estimated chronic $EC_{20}$ distribution (n=264)	ECOTOX; CCME
	Phytoplankton	0.0092	mg/L	5th percentile of estimated chronic $EC_{20}$ distribution (n=101)	ECOTOX
	Aquatic plants	0.038	mg/L	5th percentile of estimated chronic $EC_{20}$ distribution (n=28)	ECOTOX

As requested in IR-114, the TRVs have been re-evaluated using the FEQG and the BLM. The BLM was run based on baseline site-specific conditions. The test species and concentrations identified as used to generate the BLM were evaluated to develop TRVs for the applicable biotic groups. The most restrictive effect concentration for each biotic group was identified. The test endpoint was either an  $EC_{10}$  or an  $IC_{10}$ . Based on the protocol identified in Table 5-11 of the ERA, the  $EC_{10}$  (or  $IC_{10}$ ) was multiplied by 2 to obtain an  $EC_{20}$ , which was then utilized as the TRV. A summary of the TRVs for baseline conditions is identified in Table IR-114-2.

Considering that while the facility is in operation it is expected that hardness in the receiving environment will increase to approximately 9 mg/L and pH will increase to approximately 7, the BLM was re-run under updated site conditions and the TRVs were re-evaluated based on the test species and concentrations used to generate the BLM. The copper TRVs under site conditions are presented in Table IR-114-3.

**Table IR-114-2: Copper Toxicity Reference Values from Baseline Conditions BLM**

COPC	Biotic Group	TRV	Unit	Rationale	Data Source
Copper	Forage fish	0.0052	mg/L	Fathead minnow, growth ( $IC_{10}$ = 0.0026 mg/L)	FEQG BLM
	Predator fish	0.0008	mg/L	White sturgeon, growth ( $EC_{10}$ = 0.0004 mg/L)	FEQG BLM
	Zooplankton	0.0009	mg/L	Daphnia magna, reproduction ( $EC_{10}$ = 0.0004 mg/L)	FEQG BLM
	Benthic invertebrates	0.0004	mg/L	Pond snail, growth ( $EC_{10}$ = 0.0002 mg/L)	FEQG BLM
	Phytoplankton	0.0091	mg/L	Rotifer, intrinsic ( $EC_{10}$ = 0.0046 mg/L)	FEQG BLM
	Aquatic plants	0.0212	mg/L	Duckweed, root length ( $EC_{10}$ = 0.01 mg/L)	FEQG BLM

Notes:

BLM based on hardness of 5.26 mg/L, DOC of 2.24 mg/L, pH of 6.61, temperature of 13°C.  
TRV is an EC<sub>20</sub>, adjusted from an EC<sub>10</sub> or IC<sub>10</sub>.

**Table IR-114-3: Copper Toxicity Reference Values from Site Conditions BLM**

COPC	Biotic Group	TRV	Unit	Rationale	Data Source
<b>Copper</b>	Forage fish	0.01	mg/L	Fathead minnow, growth (IC <sub>10</sub> = 0.005 mg/L)	FEQG BLM
	Predator fish	0.002	mg/L	White sturgeon, growth (EC <sub>10</sub> = 0.001 mg/L)	FEQG BLM
	Zooplankton	0.002	mg/L	Daphnia magna, reproduction (EC <sub>10</sub> = 0.001 mg/L)	FEQG BLM
	Benthic invertebrates	0.001	mg/L	Pond snail, growth (EC <sub>10</sub> = 0.0005 mg/L)	FEQG BLM
	Phytoplankton	0.017	mg/L	Rotifer, intrinsic (EC <sub>10</sub> = 0.009 mg/L)	FEQG BLM
	Aquatic plants	0.015	mg/L	Duckweed, root length (EC <sub>10</sub> = 0.008 mg/L)	FEQG BLM

Notes:

BLM based on hardness of 9 mg/L, DOC of 2.24 mg/L, pH of 7, temperature of 13°C.  
TRV is an EC<sub>20</sub>, adjusted from an EC<sub>10</sub> or IC<sub>10</sub>.

The hazard quotients (HQs) for aquatic organisms were re-evaluated using both sets of TRVs, baseline conditions and site conditions during operation where hardness and pH are increased (Table IR-114-4). Consistent with Section 5.4.1 of the ERA (Appendix 10-A) an HQ less than or equal to 1 suggests low risk to the ecological receptor, and an HQ above 1 needs further investigation to determine if adverse effects are possible. Conservatively using baseline conditions, HQs for all aquatic organisms are less than 1 with the exception of predator fish in Whitefish Lake, and benthic invertebrates at all locations where HQs are slightly above 1. As such, further consideration was given to changes in site conditions when the facility is in operation. Using more realistic site conditions for hardness and pH, HQs for all aquatic organisms are less than 1 at all downstream locations, indicating no adverse effects to aquatic organisms from facility related copper. It is relevant to consider all aspects of the receiving environment and this includes induced hardness and pH since the scenario being evaluated only occurs during periods of effluent discharge. This approach is used in other jurisdictions (e.g., water licences in northern Canada issued through local water boards) and therefore the concept of induced hardness is not unique.

The copper predictions in the ERA are considered conservative based on the following assumptions:

- Baseline concentrations of copper are predominantly below the detection limit, indicating that baseline concentrations of copper are likely overestimated in the ERA.
- The effluent predictions in the ERA are based on available information from test studies at the time the ERA was prepared. Denison will be refining the effluent quality through the BATEA assessment and licensing process.
- Based on the effluent quality and quantity released to Whitefish Lake, the maximum copper concentration in Whitefish Lake and downstream waterbodies was evaluated as part of the HQ. This is a conservative assumption.
- Once the facility is operational, site conditions will change which includes increased hardness and pH; therefore, the predicated HQs under baseline conditions are considered conservative and overestimate risk.

Denison is in the process of collecting additional baseline water quality data which will be used in future ERA iterations to reconsider the baseline copper concentration in the Wheeler River. The ERA is a living document that will continue to be updated at defined intervals and will integrate new data when it is available. Denison has also committed to an ongoing environmental monitoring program which will be used to determine if there are any adverse effects to aquatic organisms from copper and other constituents of potential concern.

**Table IR-114-4: Re-Evaluated Hazard Quotients for Copper in Aquatic Organisms**

Location	Maximum Copper Concentration in Water (mg/L)	Hazard Quotients (unitless) – Baseline Conditions						Hazard Quotients (unitless) – Site Operation Conditions					
		Forage Fish	Predator Fish	Zooplankton	Benthic Invertebrate	Phytoplankton	Aquatic Plants	Forage Fish	Predator Fish	Zooplankton	Benthic Invertebrate	Phytoplankton	Aquatic Plants
Kratchkowsky Lake (reference) <sup>1</sup>	6.22E-04	0.12	0.80	0.70	<b>1.49</b>	0.07	0.03	0.12	0.80	0.70	<b>1.49</b>	0.07	0.03
Whitefish Lake North	6.20E-04	0.12	0.80	0.70	<b>1.49</b>	0.07	0.03	0.06	0.34	0.30	0.63	0.04	0.04
Whitefish Lake Middle	8.22E-04	0.16	<b>1.06</b>	0.93	<b>1.97</b>	0.09	0.04	0.08	0.46	0.40	0.84	0.05	0.05
Whitefish Lake South	8.17E-04	0.16	<b>1.05</b>	0.92	<b>1.96</b>	0.09	0.04	0.08	0.45	0.40	0.83	0.05	0.05
McGowan Lake	7.50E-04	0.14	0.97	0.85	<b>1.80</b>	0.08	0.04	0.07	0.42	0.37	0.76	0.04	0.05
Icelander River	7.49E-04	0.14	0.97	0.84	<b>1.80</b>	0.08	0.04	0.07	0.42	0.37	0.76	0.04	0.05
Russell Lake Inlet	7.17E-04	0.14	0.92	0.81	<b>1.72</b>	0.08	0.03	0.14	0.92	0.81	0.73	0.08	0.03

Note:

Bold and shaded value indicates hazard quotient greater than 1.

<sup>1</sup> Kratchkowsky Lake is a reference lake located upstream of the effluent discharge point, and as such, the site operation conditions were the same as baseline conditions.

In the Aquatic Environment section of the EIS (Section 8), the effects assessment is completed for aquatic VCs. To address the CNSC's concerns and to recognize the Cu FEQG in consideration of hardness of 9 mg/L, pH of 7, and DOC of 2.24 the BLM is 0.0005 mg/L and the following updates have been made:

- Section 8.2 Water Quality – long-term copper guideline presented is FEQG 0.0002 mg/L under background conditions in the nearfield model and 0.0005 mg/L under expected conditions of hardness 9 mg/L, pH of 7, and DOC of 2.24 in regional surface water quality results and discussion.
- Section 8.3 Fish and Fish Habitat – with the inclusion of Cu FEQG under expected conditions of hardness 9 mg/L, pH of 7, and DOC of 2.24 and some exceedances of this guideline in water quality section, the assessment for benthic invertebrates recognizes this slight increased risk by updating the magnitude for the characteristics ratings in relation to water quality from low to moderate.
- Section 8.5 Fish Health - with the inclusion of Cu FEQG under expected conditions of hardness 9 mg/L, pH of 7, and DOC of 2.24 and some exceedances of this guideline in water quality section, the assessment for fish health recognizes this slight increased risk by updating the magnitude for the characteristics ratings in relation to water quality from low to moderate.

Overall, we have updated Section 8 to recognize that while some additional risk to sensitive receptors is possible in consideration of the Cu FEQG without hardness mediation, the overall conclusions are unchanged. The residual effects of the Project are not expected to result in a change to the viability and persistence of aquatic VCs and associated KIs and were, therefore, predicted to be not significant.

The ERA was conservative in a number of ways in relation to copper, including:

- baseline concentrations of copper in water are predominantly below the detection limit (<0.0002 mg/L), indicating that baseline concentrations of copper are likely overestimated in the ERA.
- The IMPACT model predicts how constituents travel through the environment and concentrations of constituents change as a result of interactions with natural flows and lake sediments. The Kds applied in the model have largely over predicted the baseline sediment copper concentrations throughout the lakes demonstrating that the model and model inputs are conservative.
- in the EIS, copper concentrations in effluent represented an upper bound; Denison is confident the actual effluent quality will be within the range of what was assessed and specifically, lower than what was used in the EIS, and the maximum copper concentration in Whitefish Lake and downstream waterbodies was evaluated as part of the HQ.

Monitoring programs will be implemented to assess the environmental performance of the Project relative to the predictive assessment that has been completed in support of the EA process. Such monitoring is needed since there is always some level of uncertainty associated with EA predictions. Effluent, water, and sediment sampling will be completed to verify the accuracy of the effects and effectiveness of proposed mitigation measures. Copper is included in planned monitoring as it is a deleterious substance under MDMER and must be monitored in effluent per MDMER Schedule 4 and is included in trace metal analysis for water and sediment samples. As such, there are no changes needed to the monitoring proposed in the EIS.

As part of commitment 8-48, Denison is collecting baseline water quality data which includes a lower detection limit for metals including copper. Any new water quality data will be integrated into Denison's application for a licence to operate, along with updated effluent quality data. The following, recent information is provided as background context for the CNSC's review of this IR response:

- Initial 2024 results in Whitefish Lake show that copper is typically less than the new, lower detection limit of 0.00007 mg/L.
- We also note that information provided by Denison to the CNSC (November 1, 2024 Nagel to Gorzkowski) shows that copper in effluent is expected to be 0.0042 mg/L which is 5 times lower than the copper concentration in effluent used in the EIS (0.022 mg/L).

5. A new commitment (8-53) has been added to commitment register version 4 as shown here in track changes:

ID (EIS Section-chronological number)	VC/KI (as applicable; related to mitigations)	Last Updated (register version)	Details of Commitment	EIS Section or IR/TRC	Project Phase	Commitment Tracker Method	Scope of Commitment
8-53	Water Quality	4	Denison will assess and minimize copper concentrations in effluent through the BATEA assessment during licensing	IR-114 (Nov 2024)	Prior to Operation	EMS: EA Follow-up	Regulatory Requirement

**Re: Submission of the Final Environmental Impact Statement for the Denison Mines Corp Wheeler River Uranium Mine under the *Canadian Environmental Assessment Act, 2012***

Dear Jessica Way:

As you are aware, the environmental assessment for the Denison Mines Corp (Denison) Wheeler River Uranium Project (the Project) was initiated in 2019, with submission of the draft environmental impact statement in October 2022.

On November 21, 2024, the Canadian Nuclear Safety Commission (CNSC) provided notice that Denison had resolved all information requests from the Federal-Indigenous Review Team, concluding the technical review for the Project under the *Canadian Environmental Assessment Act, 2012*. The notice allows Denison to submit the final environmental impact statement (EIS) for CNSC review and acceptance.

Denison is pleased to provide the final EIS to CNSC, which is enclosed with this letter. Denison confirms that all requested revisions and updates to the EIS resulting from the technical review were completed in a comprehensive and detail-oriented manner.

Along with the final EIS, the following files are included for CNSC review and acceptance:

1. Commitments Register Version 4,
2. Indigenous Engagement Report (updated to October 31, 2024), and
3. Public Comments Table.

Should you have further questions about this, please do not hesitate to contact me at [bengland@denisonmines.com](mailto:bengland@denisonmines.com).

Sincerely,

Brianne England  
Regulatory Manager

**Subject: Reflecting the CNSC staff's stance on CNSC responsibilities under CEEA 2012 and the Species at Risk Act**

Dear Ms. England,

This letter is to provide additional rationale and context for Canadian Nuclear Safety Commission's (CNSC) position on the need for Denison to meet the Government of Canada's [Amended Recovery Strategy for Woodland Caribou](#) (*Rangifer tarandus caribou*), Boreal Population, in Canada (the Strategy) for the purposes of the ongoing Environmental Assessment (EA) for the proposed Wheeler River project (Project).

There are 3 Information Requests (IRs) from the technical review by the Federal Indigenous Review Team that relate to meeting the federal recovery strategy for Woodland caribou, including IR-149, 149-R1A and IR-157 [1-2]. For the purposes of the EIS technical review, these IRs have been accepted, with the caveat that CNSC will recommend an EA condition to the Commission.

As responsible authority for EAs under the *Canadian Environmental Assessment Act*, 2012 (CEAA 2012) for this Project, the CNSC is responsible for ensuring that the requirements of the [Species at Risk Act](#) (SARA) are met. This includes applicable recovery strategies and action plans for species at risk (s.79(1) and (2) SARA), like the Amended Recovery Strategy for the Woodland Caribou, Boreal Population, in Canada.

CNSC and Environment and Climate Change Canada (ECCC) will jointly be recommending to the Commission an EA condition requiring alignment with the federal Strategy. The EA condition will be included in CNSC's Environmental Assessment Report and provided to the Commission for their consideration.

The remainder of this letter outlines the regulatory and legal basis for recommending an EA condition to meet the federal strategy for Woodland caribou.

## Shared jurisdiction over the environment

Other than fishing, issues pertaining to the environment are not specifically enumerated under the powers between federal and provincial governments as set out in sections 91 and 92 of the *Constitution Act, 1867* respectively. The environment is, therefore, a diffuse area which may be addressed under various federal and provincial legislative powers. There is, consequently, shared responsibility over the environment. With respect to the Project, caribou are not physically restricted to provincial or territorial boundaries. As a result, there are concerted, collaborative efforts to develop conservation and recovery measures for their protection. Therefore, the provincial and federal requirements for woodland caribou are not in conflict; both can be met by Denison for its Project.

## Regulatory requirements of the CNSC as responsible authority

Under subsection 79(1), SARA confers an obligation on the ‘person’ (Responsible Authority) to notify the competent minister or ministers of the project if the project is likely to affect a listed wildlife species or its critical habitat. The SARA notification requirement covers all species listed in Schedule 1 of SARA, regardless of whether they are found on lands managed by the federal, provincial or territorial governments. Under CEAA 2012, the person who is required to ensure that an EA is conducted is the Responsible Authority. Thus, in the case of projects where the CNSC is the regulator, the onus is on the CNSC, as the Responsible Authority, to comply with section 79 of SARA (see also section 181 (1) [\*Impact Assessment Act\*](#)).

Identifying the adverse effects of a project on a listed wildlife species and its critical habitat is a requirement under subsection 79(2) of SARA. This is reinforced by the requirement of paragraph 19(1)(a) of CEAA 2012 for every EA to consider the “environmental effects of the designated project”. Under subsection 79(2), SARA confers obligations on a ‘person’ (Responsible Authority) “to identify adverse effects of the project on a listed wildlife species and its critical habitat, and, if the project is carried out, to ensure measures are taken to avoid or lessen those effects and to monitor them. These measures **must be taken in a way that is consistent with any applicable recovery strategy and action plans**” (emphasis added); notably, this includes the Amended Recovery Strategy for the Woodland Caribou, Boreal Population, in Canada. These obligations are in addition to the requirements set out in CEAA 2012 for an assessment of the environmental effects of the designated project.

Additionally, permits issued by the CNSC are subject to s.77 of SARA which states:

**77** (1) Despite any other Act of Parliament, any person or body, other than a competent minister, authorized under any Act of Parliament, other than this Act, to issue or approve a licence, a permit or any other authorization that authorizes an activity that may result in the destruction of any part of the critical habitat of a listed wildlife species may enter into, issue, approve or make the authorization only if the person or body has consulted with the competent minister, has considered the impact on the species’ critical habitat and is of the opinion that

(a) all reasonable alternatives to the activity that would reduce the impact on the species’ critical habitat have been considered and the best solution has been adopted; and

(b) all feasible measures will be taken to minimize the impact of the activity on the species’ critical habitat.

Under paragraph 19(1)(d) of CEAA 2012, the Responsible Authority is required to identify “mitigation measures that are technically and economically feasible and that would mitigate any significant adverse environmental effect of the designated project”. In addition, subsection 79(2) of SARA establishes a requirement to avoid or lessen all adverse effects of a project on listed (i.e., scheduled) wildlife species and their critical habitat, regardless of the significance of those effects.

Subsection 79(2) of SARA also requires monitoring of the actual adverse effects of a project once it is carried out. Subsection 79(2) requires a Responsible Authority to ensure that measures are taken to monitor the actual adverse effects on the listed wildlife species or its critical habitat. This implies a need to understand the actual on-the-ground effects once a project is implemented. This may involve verifying the accuracy of the predictions and determining the effectiveness of the mitigation measures; however, this requirement is independent of the significance of the predicted effects, the technology involved in the mitigation measures, or any other factors. Subsection 79(2) of SARA also requires that such measures are consistent with any applicable recovery strategy or action plan.

### **ECCC as a specialist in federal assessments on matters concerning the protection of the environment**

The proposed Wheeler River Project is a designated project (*Regulations Designating Physical Activities*, SOR/2012-147) subject to a federal EA under CEAA 2012, for which the CNSC is the responsible authority (as defined by section 15(a) of CEAA 2012). As defined by section 2(1) and in accordance with section 20 of CEAA 2012, ECCC is a federal authority, serving the interest of the Crown to provide specialist or expert information or knowledge with respect to the EA of the Project; ECCC must provide the CNSC as the responsible authority with advice on matters concerning the protection of the environment. Beyond the statutory requirement, the cooperation is also set out in part II, subsection 3(b) of the [Memorandum of Understanding between the CNSC and EC \(signed in June 2012\)](#). With respect to species at risk, including boreal woodland caribou, per section 79 of SARA, ECCC provides expert advice and guidance to assist the CNSC in meeting its obligations under SARA as further outlined below. CNSC relies on its federal counterpart's advice.

### **Federal-Provincial Species at Risk Agreements**

The CNSC understands from ECCC and the province of Saskatchewan that they have been working to collaborate on species at risk, including caribou, through an Agreement. Specifically, in 2007 ECCC and the Province entered into a Agreement under [section 10 of the Species at Risk Act](#). The CNSC notes that section 3.4 of the Agreement states: “[it] does not create any new legal powers or duties nor does it alter the powers and duties established by the SARA, the Saskatchewan Wildlife Act, or any other federal or provincial legislation”.

The Canada-Saskatchewan Agreement on Species at Risk section 10 Agreement expired in 2017 (*cf s. 19.3 of the Agreement*). The CNSC understands that although the Agreement was not renewed, ECCC and the Province continue their working practice, keeping with the intent of the lapsed Agreement. The CNSC as a responsible authority under the SARA and its obligations are unchanged by the lapsed Agreement.

The CNSC has also been informed that ECCC and the Province have a s.11 SARA agreement for boreal woodland caribou, which has been extended to March 31, 2025 and that negotiations are underway for a renewed 5-year term.

### **Consideration of the precautionary principle and NSCA objects**

The CNSC also notes that the relevance and application of the precautionary principle. To the extent that the Project may cause harm, actions that may plausibly have potential for major or irreversible negative consequences to the environment should be mitigated, even if the extent of the consequences are not conclusively known. The CNSC also has as its statutory objects the obligation to regulate in order to prevent unreasonable risk to the environment, per section 9(a)(i) of the [Nuclear Safety Control Act](#).

### **Conclusions and Next Steps**

As responsible authority for CEAA 2012 EA relative to this Project, the CNSC is responsible for ensuring that the requirements of SARA are met, including parts that apply to recovery strategies and action plans for species at risk. An EA condition that reflects this will be included in CNSC's EA Report and provided to the Commission. Denison's plan for caribou offsetting will be required to align with the Amended Recovery Strategy for the Woodland Caribou, Boreal Population and SARA, in order to fulfil the EA condition. A draft EA condition will be shared with Denison prior to inclusion in the EA report.

Once Denison has shared a more detailed version of the caribou offsetting plan that is currently under development, CNSC staff will work with ECCC to provide additional guidance on whether or not the plan needs to be modified to meet the federal requirements. It is recommended that Denison consider the comments that have been provided through the EIS technical review to date, in order to avoid having to rework this approach later in the process.

CNSC and ECCC staff are available and willing to meet with Denison to discuss the path forward and to clarify expectations, as it relates to this requirement and the proposed EA condition.

Should you have any questions, please do not hesitate to contact me, directly by phone at 343-540-6213 or by email at [Jessica.Way@cnsccsn.gc.ca](mailto:Jessica.Way@cnsccsn.gc.ca).

Sincerely,

Preparing an Offsetting Plan for Woodland Caribou, Boreal Population

In preparing an offsetting plan, the Proponent must use scientifically defensible methods and techniques and provide a rationale for the methods and techniques chosen.

Required information*	Supplemental CWS guidance for offsetting residual impacts to Boreal Caribou for the Wheeler River Project
Section 1: Description of the residual impacts of the activity to the species at risk, its residences, its habitat and/or critical habitat	
<ul style="list-style-type: none"><li>Describe the residual impacts that are likely to result from the activity, including the extent, duration and magnitude of the impacts on:<ul style="list-style-type: none"><li>The number of individuals killed, harmed, harassed, captured or taken; and</li><li>The area of habitat(s), biophysical attributes and location of critical habitat affected (e.g. destroyed, permanently altered, disrupted).</li></ul></li></ul>	<ul style="list-style-type: none"><li>Include details on the loss of Critical Habitat, including biophysical features in the project area, amount of direct and indirect habitat loss. Note that disturbed areas with biophysical features are considered critical habitat based on the definitions in the <a href="#">amended Recovery Strategy (aRS)</a>.</li><li>Include mapping at appropriate scales (i.e. regional and local-scale mapping) and summary statistics (e.g. amount of direct and indirect disturbance) of biophysical features and habitat potential, as well as the baseline information, including Indigenous knowledge, on caribou.</li></ul>
Section 2: Offset description	
<ul style="list-style-type: none"><li>Describe the proposed offset and explain how it will counterbalance the residual impacts of the activity.</li><li>Identify the location of the offset, including a map (e.g. scale of 1:50 000) and geographic coordinates.</li><li>Describe both the impact and offset sites, including existing land uses, present conditions, and relationship to the species, its residences and habitat and/or critical habitat.</li><li>Provide all timelines associated with the offsetting plan, including:<ul style="list-style-type: none"><li>When the impact of the activity will occur;</li><li>When the benefits of the offset measures are expected to be realized; and</li><li>The timelines for implementation of each element of the plan.</li></ul></li><li>Identify the parties, roles and responsibilities for implementing each aspect of the offset (including the party responsible for monitoring – see Section 6, below).</li></ul>	<b>Offset Location</b> <ul style="list-style-type: none"><li>Consider an offset <b>location in proximity to the Project</b> that has comparable ecosystem values for caribou, such as species composition, biophysical attributes, and habitat structure, as the habitat impacted by the Project.</li><li>The offset location should be selected to maximize benefits to caribou and should consider the needs of Indigenous communities local to the project, who are impacted by the Project.</li><li>The offset location should provide caribou habitat (some combination of undisturbed habitat, biophysical attributes, and/or connectivity) once restoration is complete.</li><li>The plan should include evidence-based support for the selected location outlining how it maximizes benefits for caribou.</li><li>The plan should describe how the Proponent will coordinate with other off-setting activities to maximize effectiveness. The location should be selected to maximize benefits to caribou habitat such as where several offsetting or</li></ul>

<ul style="list-style-type: none"><li>Describe the measures to avoid or mitigate any adverse impacts from the implementation of the offset itself. This includes the identification of the possible adverse impacts from the offset and analysis of how proposed measures will avoid or mitigate those adverse impacts, as well as the identification of the possible adverse impacts on other species, habitat or ecological processes.</li></ul>	<p>restoration activities are being conducted in a coordinated manner (ideally provincially coordinated).</p> <p><b>Offset Amount</b></p> <ul style="list-style-type: none"><li>The plan should result in No Net Loss to caribou habitat, including both undisturbed habitat and biophysical habitat.</li><li>The total area required to be offset does not include restoration of the Project area. To be clear, onsite restoration, either progressive or during the decommissioning stage is not an offsetting measure.</li><li>Offsetting requirement for this project, based on the calculated area of critical habitat destruction, should have a ratio between 4:1 and 17:1 to be consistent with the recovery objectives. The final offset amount will be based on the final amount of critical habitat destruction using the aRS methodology. The total destruction of critical habitat to which the offset ratio will be applied for the calculation for the total offset amount is: ((Project footprint + 500m buffer) - (overlapping area(s) already considered disturbed habitat) + (area(s) that contains the biophysical attributes required by boreal woodland caribou to carry out life processes)).</li></ul> <p>There are some key strategies that can help justify the reduction in the offset amounts required to achieve a no net loss outcome.</p> <ul style="list-style-type: none"><li>Minimizing time lags between impact occurrence and offset maturity is crucial for reducing required offset amounts, which can be achieved through implementing advanced offsets before impacts occur or by accelerating restoration outcomes to more quickly deliver functional ecological gains.</li><li>Enhancing offset quality effectively reduces multiplier requirements by targeting high ecological equivalence between impacted and offset sites, selecting locations with superior connectivity and landscape context, utilizing proven restoration techniques, and implementing offsets in areas with greater conservation priority or value.</li><li>Reducing long-term risks necessitates securing permanent legal protection for offset sites, implementing comprehensive monitoring programs with clear intervention triggers, and incorporating adaptive management frameworks</li></ul>
--	--

	that allow for evidence-based adjustments to ensure continued ecological performance over time.
	<b>Offset habitat types</b> <ul style="list-style-type: none"><li>• The plan should undertake an ‘equivalency’ approach to offsetting such that the adverse effects of the Project are compensated by protecting, enhancing, or restoring equivalent ecological function at the offsetting site. The biophysical attributes described for SK1 in Appendix H of the aRS should be used as a guide to determine equivalency of habitat types for offsetting locations in SK1.</li><li>• The plan should focus on restoration of anthropogenically-disturbed caribou habitat (e.g. linear features and/or forest harvest operations) that will provide biophysical attributes when restored.</li><li>• If no locations are available in SK1 to meet the ‘equivalency’ approach, then CWS will consider an offsetting location in SK2 that treats anthropogenically-disturbed areas with potential to provide undisturbed habitat or biophysical attributes as described for SK2 in Appendix H of the aRS. If this approach is agreed to provide the best outcome for caribou, it should be noted that the offset amount may need to be adjusted to account for offsetting in a range that has not been impacted by the Project.</li></ul>
	<b>Offset Methods for Restoration</b> <ul style="list-style-type: none"><li>• Include a description of the intended restoration methods. The description should include the rationale for the methods selected, their appropriateness for the targeted habitat type, and potential risks of failure. The plan should indicate if the restoration methods are previously tested and proven techniques and provide examples if available.</li><li>• Coordinate with other offsetting activities to maximize effectiveness.</li><li>• On-the-ground restoration activities should have an Operational Plan and a mitigation plan, that includes response to the presence of caribou in the restoration area, particularly during calving season.</li></ul>
	<b>Timing of Restoration</b> <ul style="list-style-type: none"><li>• The plan should include a clear description and timeline of the intended restoration actions and methods, including a schedule of activities and</li></ul>

	evidence-based rationale that supports the use of the proposed method(s) for the habitat type(s) being restored.
<b>Section 3: Offset ownership</b>	
<ul style="list-style-type: none"> <li>Identify who owns the offset and provide proof that the offset can be undertaken by the relevant parties.</li> <li>Confirm that all commitments vis à vis the offset will be transferred to any new owner or operator.</li> </ul>	<ul style="list-style-type: none"> <li>The plan should include information on ownership of the offset and any plans for provincially led protection of offset.</li> </ul>
<b>Section 4: Offset assessment</b>	
<ul style="list-style-type: none"> <li>Describe the projected future conditions at the impact and offset sites (use conservative estimates): <ul style="list-style-type: none"> <li>Without the offset; and</li> <li>With the offset.</li> </ul> </li> <li>Describe the timing of the short term and long-term benefits, in particular in relation to the timing of the adverse impacts of the activity. <ul style="list-style-type: none"> <li>Describe the short-term and long-term benefits of the offset, including how they: <ul style="list-style-type: none"> <li>Compare to the anticipated residual impacts of the activity (from Section 1);</li> <li>Compare to the duration of the adverse impacts of the activity; and</li> <li>Contribute to the survival and recovery of the species, including attainment of the population and distribution objectives for the species in question (where the Government has established those objectives).</li> </ul> </li> </ul> </li> <li>Explain how the benefits of the offset were determined. <ul style="list-style-type: none"> <li>Include a description of the extent to which the type of offset has been demonstrated to be effective, particularly in similar circumstances;</li> <li>Describe all relevant uncertainties.</li> </ul> </li> <li>Demonstrate that the offset is additional: <ul style="list-style-type: none"> <li>Describe how the offset will provide benefits to the species above what is already taking place or planned. This must include the description of the business-as-usual scenario.</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Include a risk assessment of the offset not functioning as intended, and design features to reduce risk of offset failure.</li> </ul>

<ul style="list-style-type: none"><li>○ If applicable, describe any government funding received to help pay for the offset.</li></ul>	
<b>Section 5: Contingency measures</b>	
<ul style="list-style-type: none"><li>• Describe and characterize the risks that the offset will not function as intended, and the potential impacts, accounting for the risks of partial and complete failure.</li><li>• Describe the design features to prevent risks from occurring.</li><li>• Describe the contingency measures that will be put in place if the offset does not function as intended.</li></ul>	<ul style="list-style-type: none"><li>• Include contingency measures should the offset not be successful.</li></ul>
<ul style="list-style-type: none"><li>• Describe the monitoring measures that will be used to assess the effectiveness of the offset, including:<ul style="list-style-type: none"><li>○ The methodology and parameters to be used to measure the effectiveness of the offset;</li><li>○ The methodology and parameters to be used to identify performance failures and to trigger contingency measures;</li><li>○ Timelines (expected frequency of monitoring).</li></ul></li><li>• Describe responsibilities and timelines for verification of offset implementation by a third party (can be an independent organization or a group of stakeholders).</li><li>• Provide the timelines and method for reporting.</li></ul>	<ul style="list-style-type: none"><li>• Include a commitment to report on progress and the level of success observed at off-setting location. The plan should list the types of information that will be provided to demonstrate success, and the frequency of the reporting/monitoring.</li></ul>

# Wheeler River Project Bulletin

## PROJECT OVERVIEW

Denison Mines Corp. (Denison) is proposing to develop an *in situ* recovery uranium mining and processing plant [the Wheeler River Project](#) - in the Athabasca Basin in Saskatchewan, approximately 600 kilometres north of the City of Saskatoon, and 35km by road north of the Key Lake mill. The proposed project is located within Treaty 10 territory, the homeland of the Métis, and within the traditional territories of the Dene, Cree, and Métis peoples.

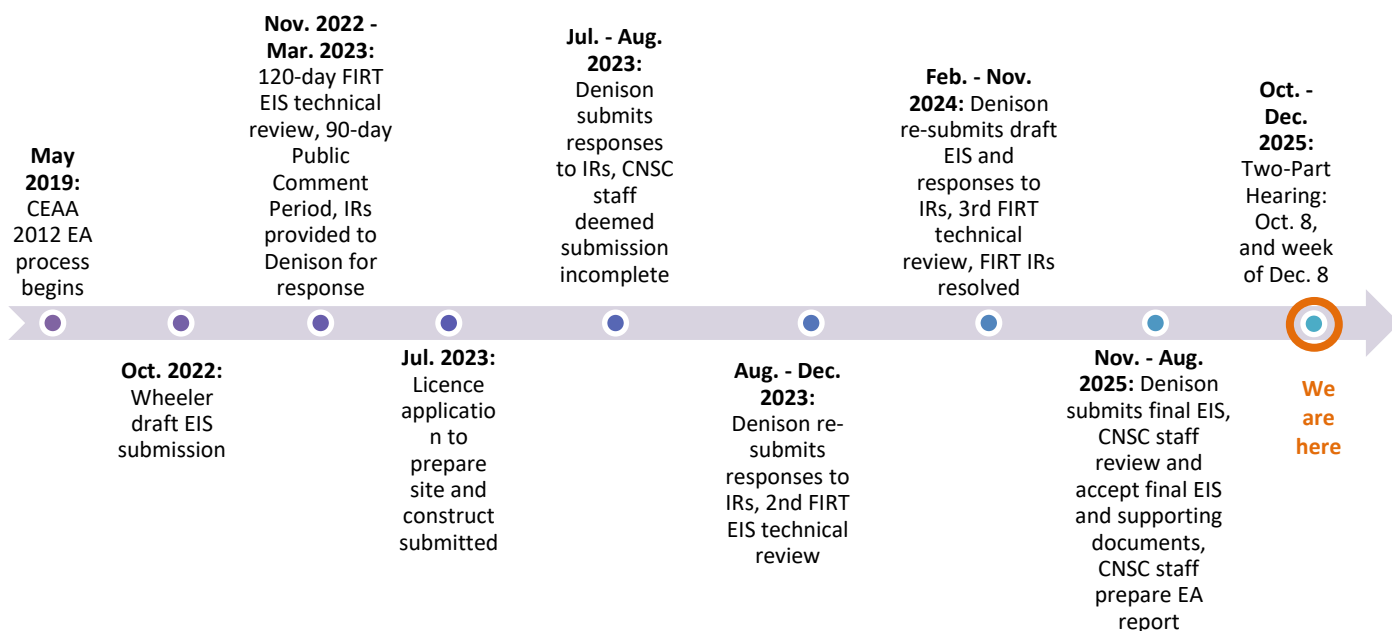

Since 2019, the proposal has been undergoing an [environmental assessment](#) (EA) as per the [Canadian Environmental Assessment Act, 2012](#) (CEAA, 2012). In July 2023, Denison submitted a licence application to prepare site and construct a mine and mill facility, which is currently before the Commission for their consideration. An EA decision is required before a licence can be issued. The project is also subject to a [provincial EA](#) as per the province of Saskatchewan's [Environmental Assessment Act](#).

## ENVIRONMENTAL ASSESSMENT REVIEW PROCESS

Denison submitted a draft environmental impact statement (EIS) in October 2022 and the federal and Indigenous review team (FIRT) completed a technical review of the draft EIS. On [March 20, 2022](#), CNSC staff requested that Denison submit responses to all [information requests \(IRs\) from the FIRT](#), along with a commitments report and an update on Indigenous engagement.

Since this original submission, the FIRT has reviewed multiple rounds of Denison's responses to IRs. On November 20, 2024, CNSC staff completed their review of Denison's responses to outstanding IR and deemed all IRs as accepted. On November 22, 2024, Denison submitted a Final EIS package including revised responses to the Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project. On December 24, 2024, CNSC staff completed their technical review of the final EIS package and deemed the final EIS acceptable.

## TIMELINE

## WHERE WE ARE NOW

On February 27, 2025, CNSC announced hearing dates for a public hearing on Denison's Wheeler River Project. To inform the Commission's decisions, CNSC staff have developed the CEAA 2012 [EA Report](#) summarizing the results of the EIS technical review and CNSC staff's recommendations to the Commission. The Commission Member Document is available online in 25-H9 [Volume 1](#), [Volume 2](#) and [Volume 3](#), which contains CNSC staff's review, assessment and recommendations regarding Denison's request for licence. This package includes the Indigenous Consultation Report, which details consultation and engagement activities conducted for the project and the CNSC's duty to consult as an agent of the crown. All hearing documentation can be found on the CNSC's website [here](#).

As part of the Commission's proceedings, decisions will be made on the EA, Denison's licensing application, and on whether the duty to consult with Indigenous Nations and communities has been met. These decisions will be made via a public Commission hearing, which will include opportunities for Indigenous Nations and communities, and public participation.

Part one of the two-part hearing took place on October 8, 2025, where staff from CNSC and Denison presented oral and written submissions, related to Denison's application. The second part of the hearing will take place the week of December 8, 2025, in person in Saskatoon where public intervenors will have an opportunity to intervene orally. The public hearing will be webcast live here:

<https://www.nuclearsafety.gc.ca/eng/the-commission/webcasts/>

During part two of the hearing, members of the public, Indigenous Nations and communities and any other parties are invited to present before the Commission. For those that will be intervening orally, PowerPoint presentations are due to the Commission Registry by November 24, 2025. For more information on the CNSC's intervention process, please visit the CNSC's [Notice of Public Hearing and Participant Funding](#) webpage.

## STAY INFORMED, STAY CONNECTED!

Subscribe to the updated [Canadian Impact Assessment Registry notifications service](#) to receive updates on the Wheeler River EA process, and any other EA or Impact Assessment Processes that you are interested in. When you subscribe to this notification service, you will receive a email when new content is posted on the Canadian Impact Assessment Registry for the projects you are following. Head over to [www.iaac-aeic.gc.ca](http://www.iaac-aeic.gc.ca) to sign up!

## 1 Introduction

This Executive Summary is associated with the draft Environmental Impact Statement (EIS) for the Wheeler River Project (the Project) proposed by Denison Mines Corp. (Denison). Following the *Generic Guidelines for the Preparation of an Environmental Impact Statement Pursuant to the Canadian Environmental Assessment Act, 2012* (CNSC 2021a) and the provincial Terms of Reference for the Project (Denison 2019), this Executive Summary contains the following information:

- a high-level overview of the Project and Environment Assessment results (Section 2);
- a concise description of all key Project components and related activities (Section 3);
- a summary of the consultation conducted with Indigenous groups, the public, and government agencies (Section 4);
- an overview of the key environmental effects of the Project and proposed technically- and economically-feasible mitigation measures (Section 5);
- conclusions on the residual environmental effects of the Project after taking mitigation measures into account and the significance of those effects (Section 5); and
- sufficient details to support understanding of the Project, its potential environmental effects, mitigation measures, the significance of the residual effects and follow-up programs (Sections 3, 4, 5 and 6).

## 2 Project Overview

The Wheeler River Project (the Project) is Denison's proposed in situ recovery (ISR) uranium mine and processing plant:

- Location: northern Saskatchewan, Canada.
- Project components and activities: the central Project components are the ISR mine and the processing plant. Supporting Project components and activities include those needed for waste management, water management, distribution of electricity, and transportation, such as pads, ponds, buildings, roads, and an airstrip.
- Inputs: freshwater, chemicals (for mining, uranium processing, treating water), electricity, and fuel.
- Outputs: waste (organics, clean waste rock, special waste rock (drilling core), domestic waste, industrial waste, precipitates from the processing plant and water treatment, sewage), air emissions including greenhouse gas emissions (GHGs), noise, and treated effluent.
- Product:  $U_3O_8$  or yellowcake. The product Denison sells is ultimately used as fuel in nuclear power plants, supporting global efforts to reduce GHG emissions.

- Employment: Approximately 300 workers during Construction and 180 during Operation. The Project will be operated as a fly-in-fly-out operation.
- Project duration: Total of approximately 38 years, about 2 years for Construction, 15 years for Operation, 5 years for Decommissioning, and 15 years for Post-Decommissioning periods.

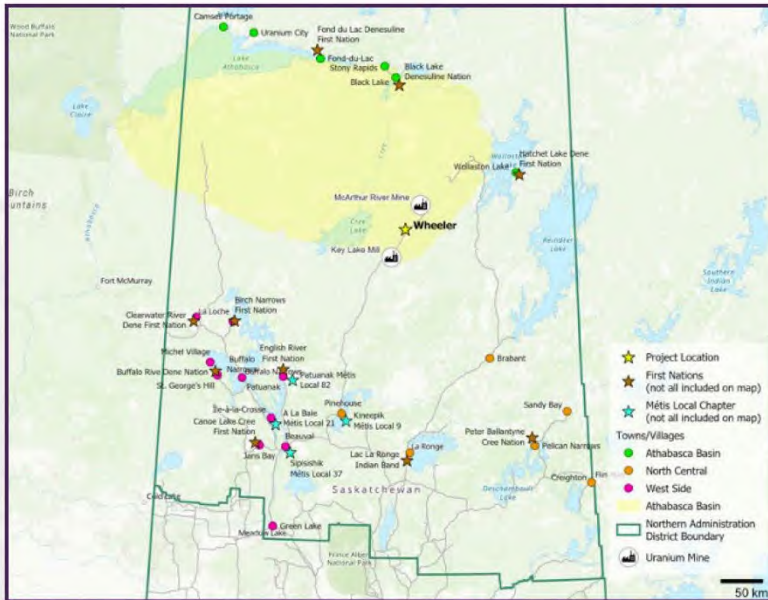

The environmental assessment (EA) outlined in this environmental impact statement (EIS) was transparent and conservative, following a standard, step-wise approach for evaluating Project effects including cumulative effects. In an effort to generate a conservative EA and provide operational flexibility, Denison developed an assessment basis for the EA which bound, or was higher than, the current understanding of the Project's engineering design basis. For example, the direct Project footprint based on engineering site plans is about 75 ha, but the EIS assumed the Project's area of disturbance was closer to 170 ha. Similarly, the annual production for current engineering design is 6 Mlbs  $U_3O_8$  per year over 10 years, but the EIS assumed production of 9 Mlbs  $U_3O_8$  per year over 15 years, with a peak production up to 12 Mlbs  $U_3O_8$  in a given year to allow for operational flexibility. This means that, for example, the EIS assessed inputs needed and outputs generated on an annual basis as being 50% more than expected.

Residual effects remaining after mitigation were largely linked to land clearing, increases in traffic, emissions to air, waste generation, and water management. Residual effects were evaluated for 32 Valued Components (VCs) and significance determined for receptor VCs. The evaluations and conclusions of the EIS are that the Project can be constructed, operated, and decommissioned while regional plant communities are stable and continue to function, regional fish and wildlife populations are viable and healthy, human health is protected, there is continued opportunity for land use activities, including exercising Indigenous rights, and there is continued social and economic viability of local economies. The EIS outlines mitigation measures, monitoring requirements, and commitments needed for Denison to have confidence that Project is operating as planned and that the actual effects resulting from Project Construction, Operation, and Decommissioning are at or below predicted effects.

Overall, the Project has the potential to achieve a superior standard of environmental sustainability when compared to conventional uranium mining operations. Owing, in large part, to the use of the ISR mining method, the Project has potentially fewer residual effects remaining after mitigation when compared to conventional open pit or underground mining methods and conventional milling activities.

Importantly, Denison has been proactively engaging with Indigenous communities and organizations, the general public, and regulatory agencies since 2016. The use of a collaborative approach to engagement and advancement of the Project is exemplified by the input these groups have provided to influence both project designs and the EA in various ways. Denison views the EIS as an important planning tool that will be used to support future activities and represents one stage in the rigorous EA, licensing, and permitting process for a uranium mining facility in Canada.

## LOCATION

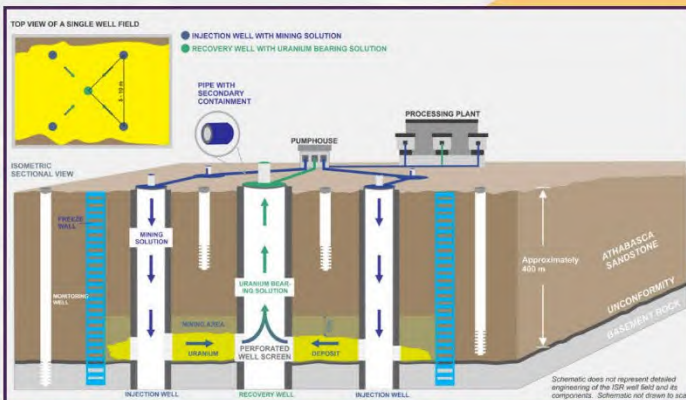

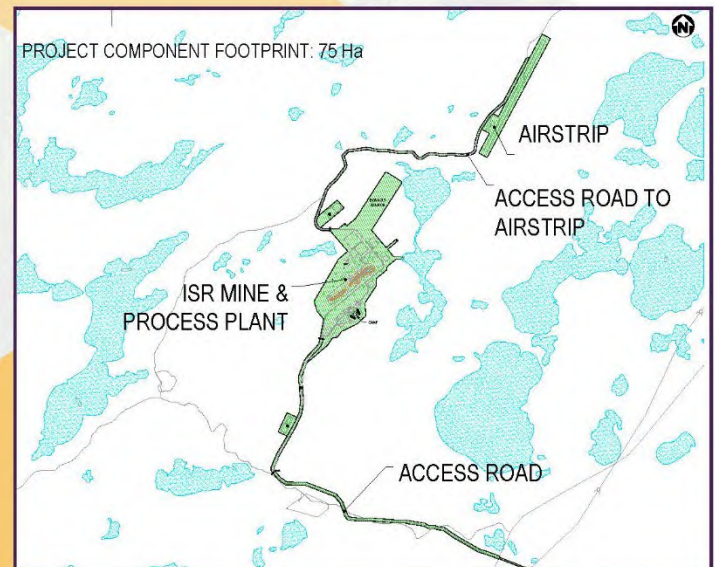

The Wheeler River Project is located in northern Saskatchewan in the Athabasca Basin.

## PROJECT FOOTPRINT

The main Project components are the in situ recovery mine and the processing plant.

## IN SITU RECOVERY

In situ recovery uses an acidic solution to leach uranium ores from the ground through a series of injection and recovery wells. The processing plant houses the tanks and equipment to process the uranium recovered from in situ recovery into yellowcake. Denison will sell the yellowcake to the market for use in nuclear power plants, supporting global efforts to reduce greenhouse gas emissions.

## VALUED COMPONENTS & PROJECT INTERACTIONS

Denison is assessing elements, called valued components, important to people or the environment, and the potential effects of the Project on these elements.

### 3 Project Setting

The Project is a proposed ISR uranium mine and processing plant located in the Athabasca Basin region of northern Saskatchewan, Canada (Figure 1).

More specifically, the Project site is located approximately 600 km north of Saskatoon and is found mid way between Cameco Corporation's Key Lake Operation and McArthur River Operation approximately 4 km west of Highway 914.

The Project is a joint venture between Denison (90%) and JCU (Canada) Exploration Company Ltd. (JCU) (10 %). Denison is also a 50% owner of JCU, which means that Denison has an effective 95% ownership interest in the Project. Denison is the operator of the Project and as such is the proponent in all regulatory matters.

The Project falls within the boundaries of Treaty 10, in the Nuhtsiye-kwi Benéne (Ancestral Lands) of English River First Nation (ERFN), in the traditional territory of the Kineepik Métis Local #9, in the homeland of the Métis, and within Nuhenéné, the traditional territory of the Athabasca Denesųliné. It is also located within the Northern Administration District (NAD) of Saskatchewan (Figure 1). The NAD of Saskatchewan includes approximately 250,000 square kilometers (about 44% of Saskatchewan's land area), and is home to 36,000 people, or approximately 3.2% of the Province's population (Statistics Canada 2022).

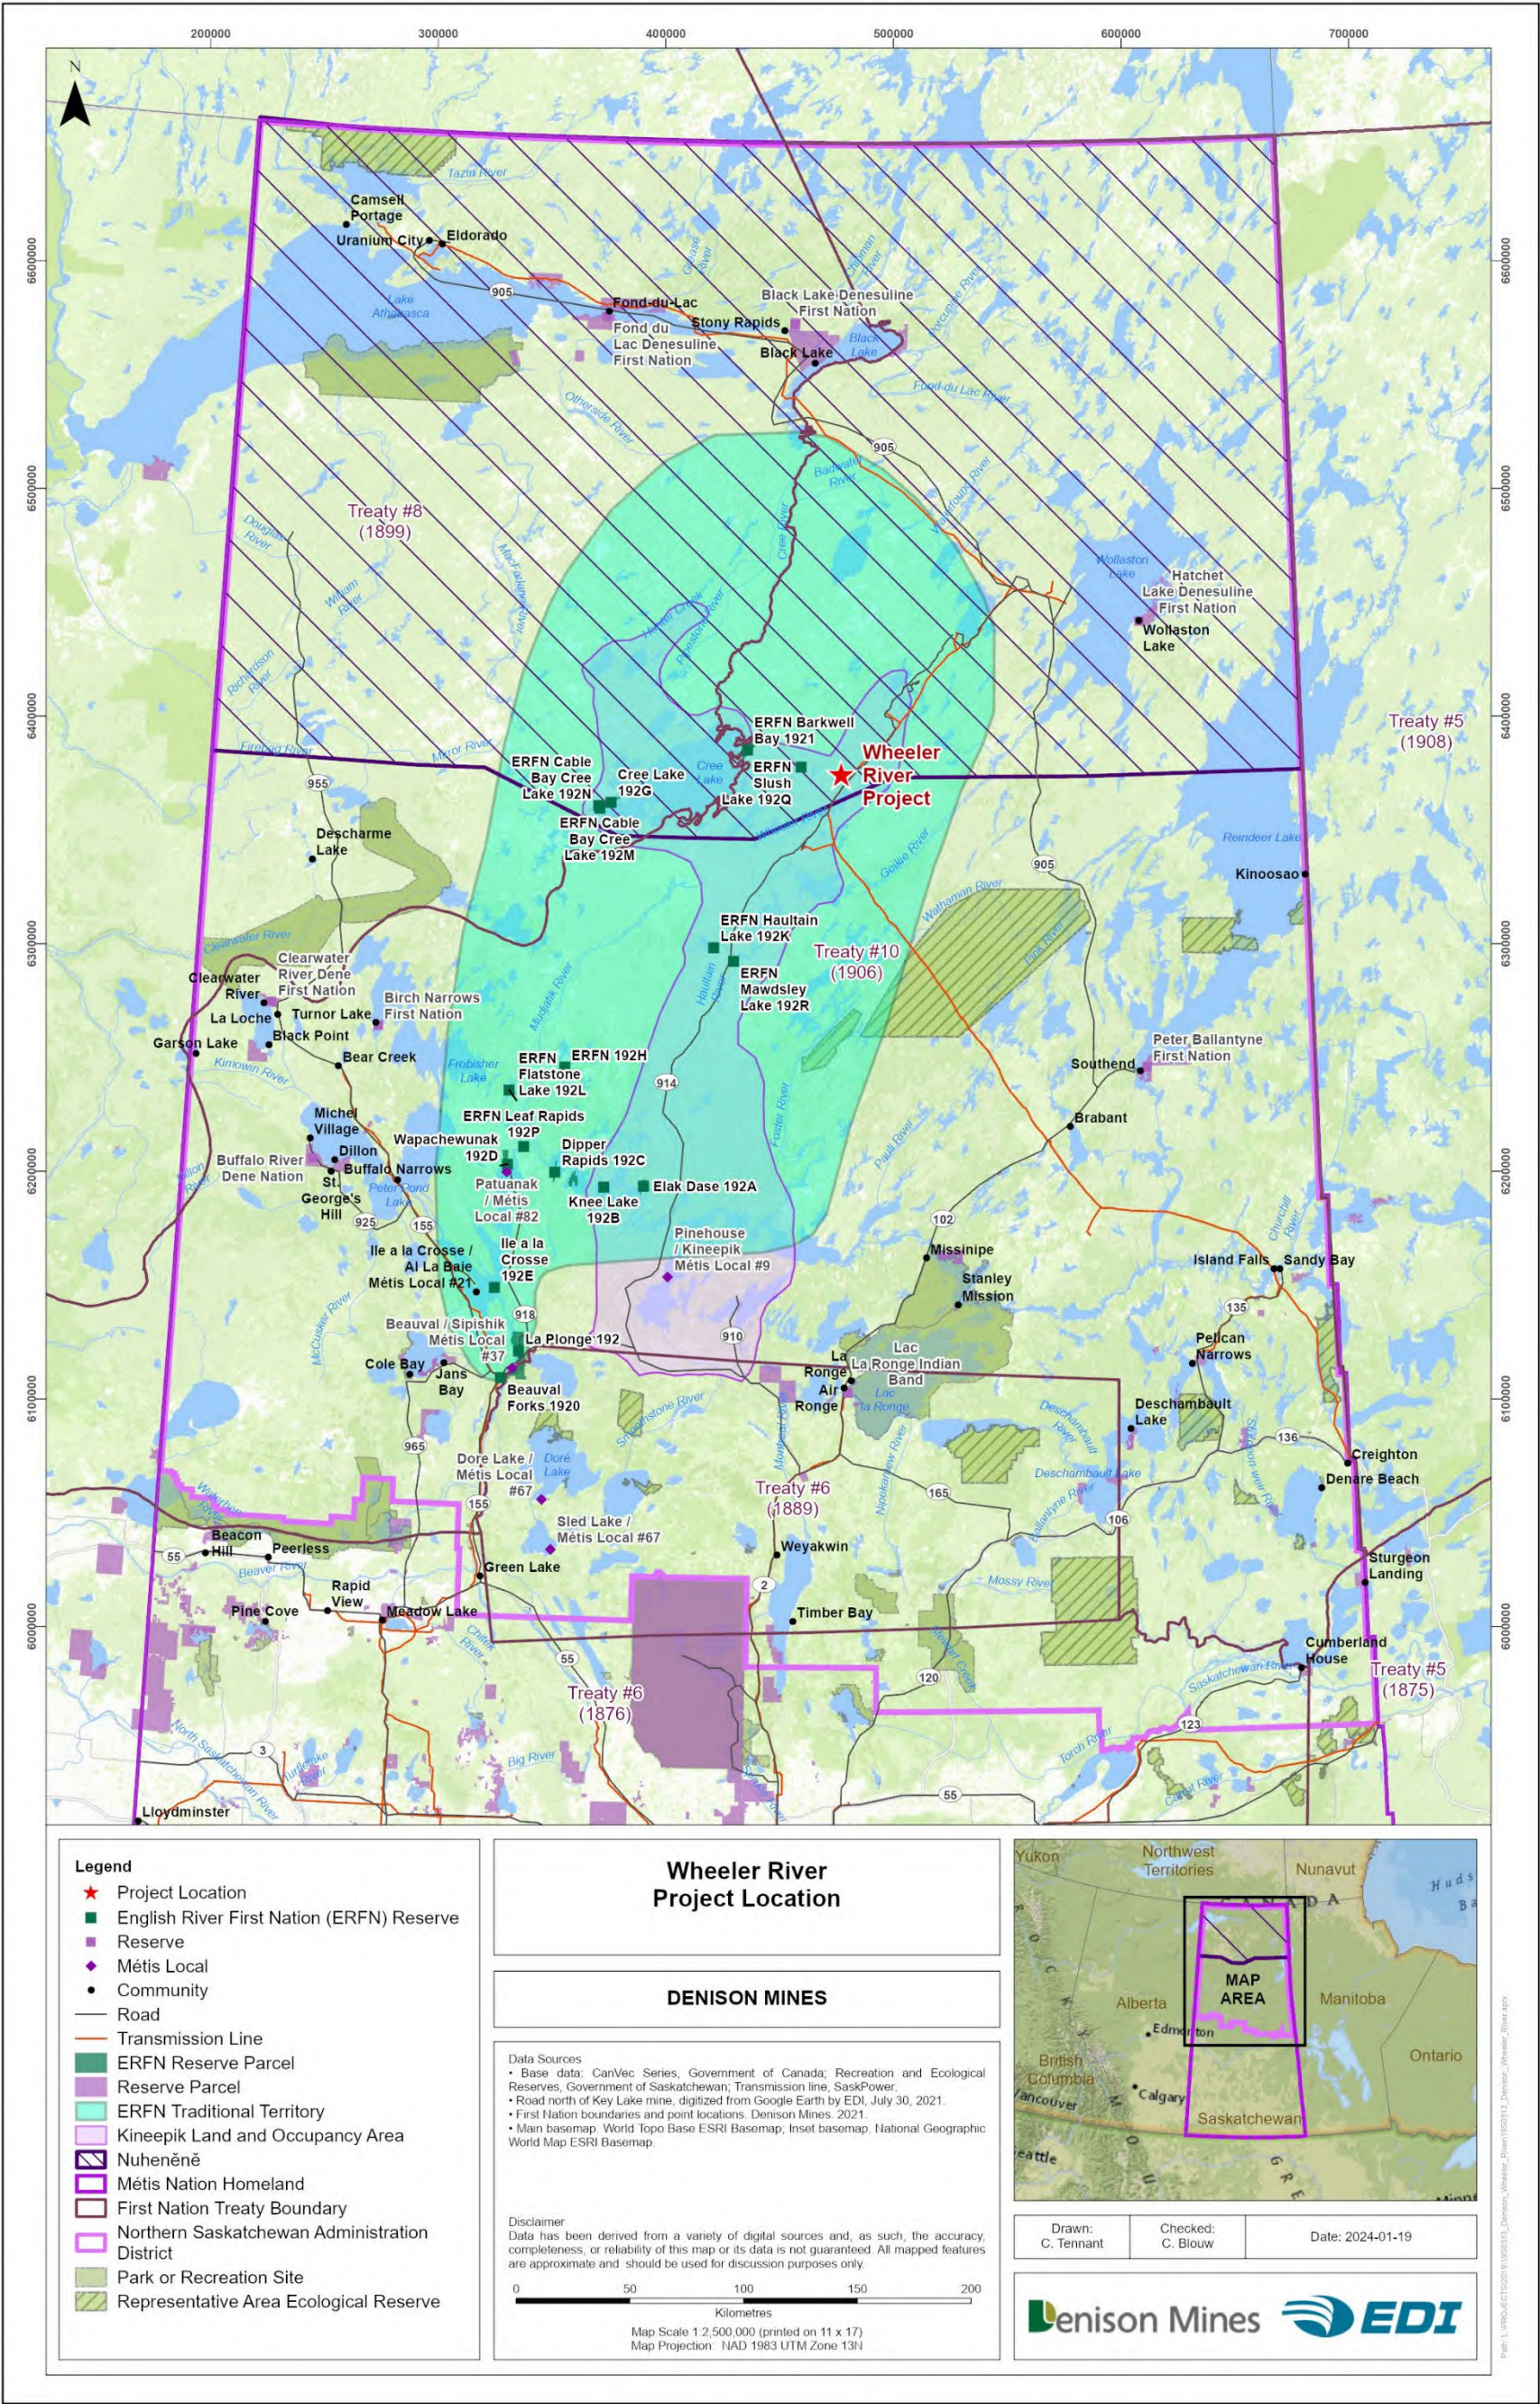

Figure 1: Wheeler River Project Location

No populated communities are located in the immediate proximity of the Project. Travelling by existing roads, the closest populated community to the Project is approximately 260 km away. Calculated using a straight line, the closest communities are approximately 150 km from the site. Recreational, industrial, and traditional resource user leases occur nearby. The closest recreational lease is located approximately 2.5 km away. The closest traditional resource user lease is approximately 12 km away.

### 3.1 Purpose of and Need for the Project

A recent report by the United Nations Intergovernmental Panel on Climate Change examined 89 climate change mitigation scenarios and concluded that achieving the 1.5°C target from the Paris Agreement will require an immediate reduction in global GHG emissions and an increase in nuclear power generation of approximately 2.5 times by 2050 (World Nuclear Association 2021). Without a significant contribution from nuclear energy, as the global power mix shifts to respond to climate change initiatives, the cost of achieving meaningful decarbonisation targets will steadily rise, or targets will simply go unmet. Nuclear energy is critical to global climate change objectives because of its unique combination of low carbon emissions, large scale, and high level of reliability.

Nuclear power is safe and reliable. The Canadian nuclear industry is one of the most closely monitored industries in the world. Major nuclear facilities are the most protected critical infrastructure in Canada. Not once has a nuclear incident caused a death in Canada and very few other industries have such a strong health and safety record. Canada's nuclear safety record is unmatched by any other industry in the world (Canadian Nuclear Association 2022). It is one of the few reliable energy sources that can reduce greenhouse gas emissions. The world's current use of nuclear power already reduces emissions by about 2.5 billion tonnes of carbon dioxide each year by avoiding fossil fuels (World Nuclear Association 2022a).

Mining of uranium is the first step in the nuclear fuel cycle, which ultimately concludes with the fabrication of nuclear fuel assemblies provided to nuclear power plants for the purpose of generating low-carbon, reliable, and low-cost baseload electricity.

Presently, the annual global uranium supply is less than annual global demand, and limited inventories have been accessed to make up the supply shortfall. In the upcoming decade, many new uranium mining projects will be required to meet the needs of existing global nuclear power plants, without considering additional demands from new plants (both conventional and emerging small modular reactor designs) and life extension of existing plants (World Nuclear Association 2022b).

The purpose of the Project is to construct and operate an ISR uranium mine and processing plant to provide uranium supply necessary to meet existing and increasing global demand for nuclear power generation. Facilitating global growth in nuclear through environmentally sustainable

uranium exports positions Canada and the Province of Saskatchewan to not only help Canada meet its climate change objectives, but to support numerous nations around the world to do the same. Canada has a unique endowment of uranium resources in northern Saskatchewan, and these resources are needed to help avert a global climate crisis.

The ISR mining method proposed for the Project has the potential to improve overall economics for smaller scale uranium deposits while minimizing disturbance to the land and resources in the area.

ISR mining uses a water-based solution, fortified with mining reagents, to dissolve naturally occurring uranium from within a host rock, while the host rock remains in place (in situ) below surface. This mining method allows for the removal the uranium mineralization without physically removing the host rock for processing on surface. Accordingly, the Project involves no underground or open pit mine workings, no heavy equipment is needed to excavate rocks, and people do not work underground. Taken together, ISR mining is an environmentally sustainable way to mine uranium, as minimal surface disturbance occurs, minimal waste rock is generated, and no long term storage of conventional tailings is required.

Denison recognizes the thriving culture and deep-rooted traditions of northern Saskatchewan communities and their aspirations of achieving economic growth and prosperity. Denison strives to achieve the development of the Project through positive partnerships with Communities of Interest, integrating information from Indigenous and non-Indigenous Interested Parties, and maintaining high standards for environmental protection and worker safety.

### 3.2 Project Proponent

Denison is a publicly traded uranium development and exploration company with interests focused in the Athabasca Basin region of northern Saskatchewan, Canada. The company trades on the Toronto Stock Exchange and NYSE American Exchange, and is headquartered in Toronto, Ontario, with offices in Saskatoon, Saskatchewan, and Elliot Lake, Ontario.

Denison (and its predecessor companies) has over 50 years of uranium mining experience in Ontario, Saskatchewan, and the United States. Today, the company is part owner (22.5%) of the McClean Lake Joint Venture, which includes the McClean Lake Operation in northern Saskatchewan. In addition, Denison provides expert mine decommissioning and care and maintenance services through its Closed Mines group, which is responsible for Denison's closed uranium mining operations in the Elliot Lake region of northern Ontario.

Denison currently holds licences with the Canadian Nuclear Safety Commission (CNSC) for its decommissioned uranium mine sites in the Elliot Lake region, and for the areas within the Wheeler River Property as part of feasibility field testing (Federal Nuclear Substance and Radiation Device Licence). Additionally, Denison holds a permit to Operate a Pollutant Control Facility with the Province of Saskatchewan in connection with the feasibility field testing at Wheeler River.

Denison's performance under its licences and permits exemplifies the company's commitment to the operation of its facilities in a manner that prioritizes safety, environmental protection, and sustainable development.

### 3.3 Regulatory Framework for the Environmental Impact Statement

#### 3.3.1 Federal and Provincial Cooperation and Legislation

The Federal and Provincial Environmental Assessment (EA) processes for the Project will be conducted in parallel. The Environmental Assessment and Stewardship Branch of the Saskatchewan Ministry of Environment (SK MOE) and the CNSC will cooperate in conducting a coordinated provincial-federal EA that will follow the spirit of the Canada-Saskatchewan Agreement on Environmental Assessment Cooperation (2005; Government of Canada 2016) to the extent possible. The agreement allows for cooperation in the assessment of projects that require regulation by both levels of government. The cooperation agreement creates opportunity for a single EIS that meets the requirements of both levels of government, such that each level of government can make an independent decision on the approval of the Environmental Impact Statement.

Denison has prepared the draft EIS to meet the requirements outlined in *The Environmental Assessment Act* (Government of Saskatchewan 2018) and has submitted the draft EIS to the SK MOE's Environmental Assessment and Stewardship Branch. The Project will require issuance of a ministerial approval under Section 15 of the *Environmental Assessment Act* as well as a permit to construction and operate a pollutant control facility before construction can begin. Denison will apply for the Provincial construction and operating permit at a later date.

The proposed Project will include the Construction, Operation, and Decommissioning of a uranium mine, processing plant, and supporting facilities on a site that is not within the boundaries of an existing licensed uranium mine or mill. As such, the Project is a designated project as set out in Section 31 of the Regulations Designating Physical Activities (Government of Canada 2014) and is, therefore, subject to an EA. The CNSC is the federal authority responsible for the EA and the EIS for the Project has been prepared to comply with the federal requirements of the *Canadian Environmental Assessment Act, 2012* (Government of Canada 2019).

### 3.3.2 Additional Information Related to the Regulatory Framework and Licensing/Permitting

In addition to regulatory requirements from federal and provincial Acts and regulations, Denison has applied several other guidelines, policies, standards, and codes to the Project while completing the EIS. These include, but are not limited to:

- technical guidance from the Impact Assessment Agency of Canada (formerly the Canadian Environmental Assessment Agency; e.g., CEAA 2015a, b, c);
- various CNSC regulatory documents (e.g., REGDOC-2.9.1 [CNSC 2020]; REGDOC-2.11-2 [CNSC 2021c]; REGDOC-3.1.2 [CNSC 2018]; REGDOC-3.2.2 [CNSC 2019]);
- various standards from the Canadian Standards Association (e.g., N288.4-10 [CSA 2010]; N288.5-11 [CSA 2011]; N288.6-12 [CSA 2012a]; N286-12 [CSA 2012b]; N288.7-15 [CSA 2015]; N294-19 [CSA 2019]; and
- guidance from the Government of Saskatchewan (e.g., Northern Mine Decommissioning and Reclamation Guidelines [Government of Saskatchewan 2008]; Saskatchewan Environmental Code and attendant standards [Government of Saskatchewan 2022]).

## 3.4 Project Description

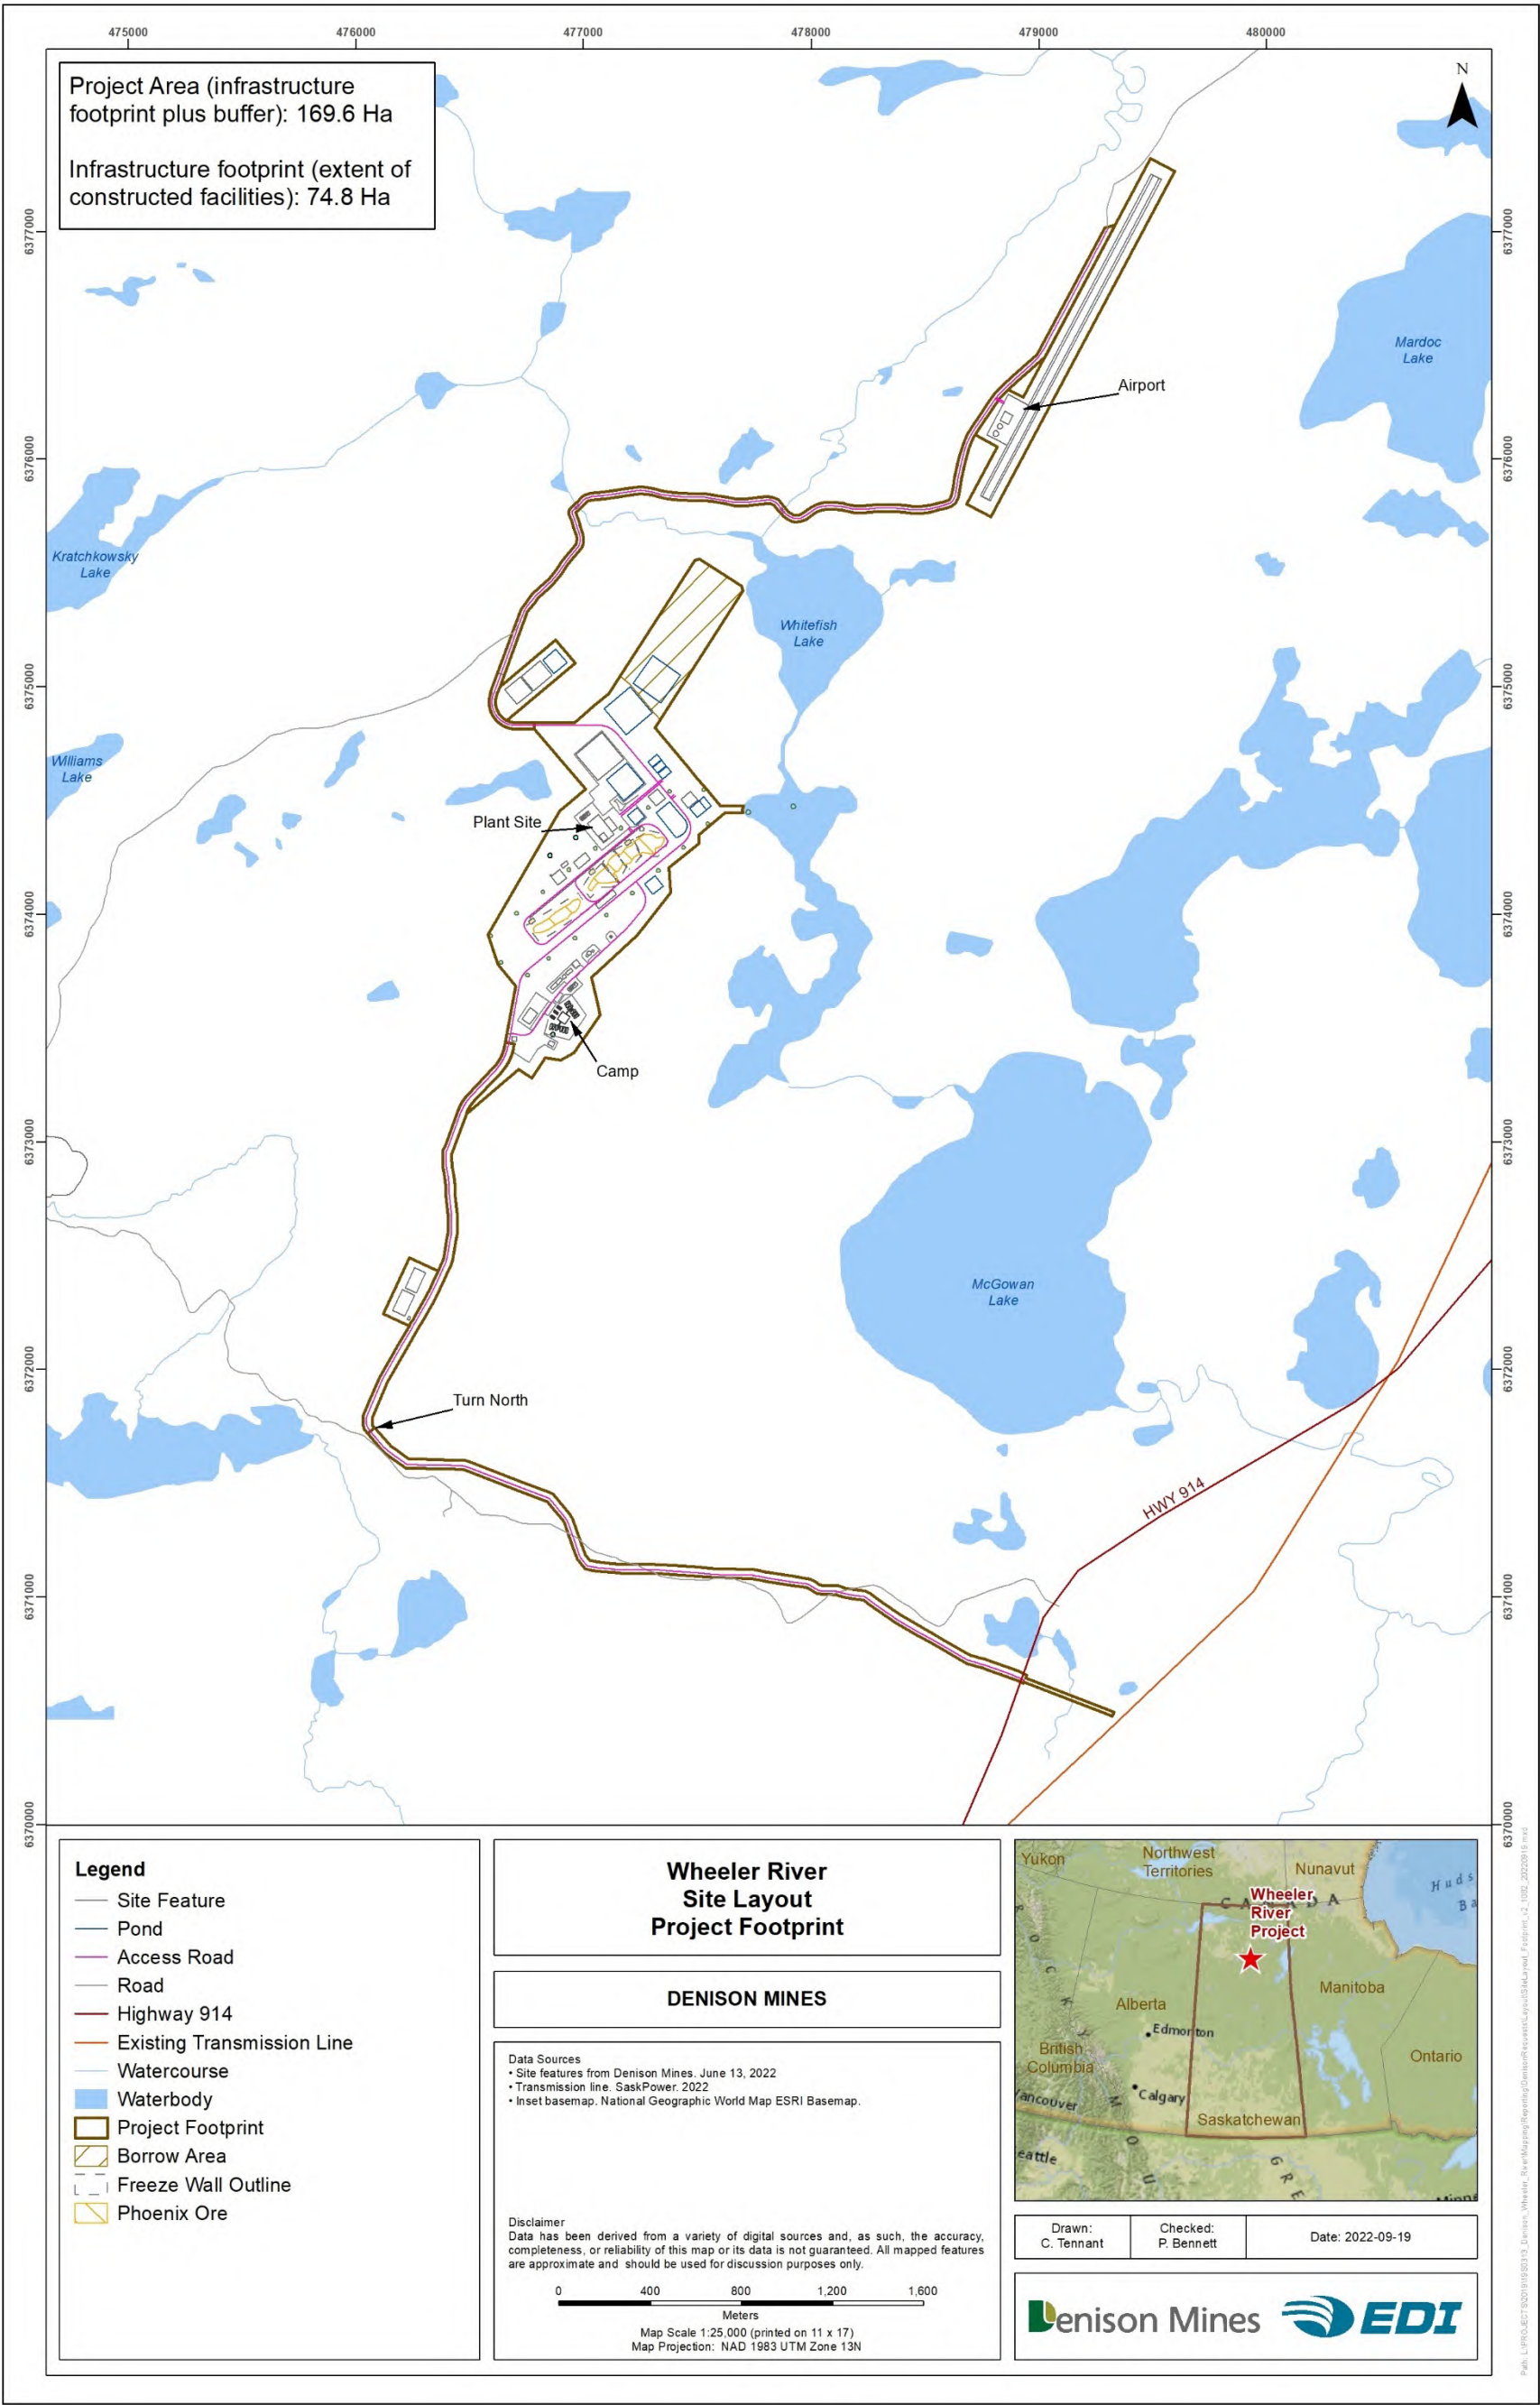

### 3.4.1 Project Area

The Project is anticipated to have a total footprint of 75 ha. By applying a buffer around these components, the maximum footprint of the Project was estimated to be 170 ha (Figure 2). This spatial area with the buffer is referred to as the Project Area in the biophysical and human environment assessments of the EIS.

### 3.4.2 Project Components

The proposed site layout for the Project is provided in Figure 3. Various components associated with the Project, which are described in subsequent subsections, include:

- mining;
- processing;
- water management;
- waste management;
- access and transportation;
- power and heating; and
- support facilities.

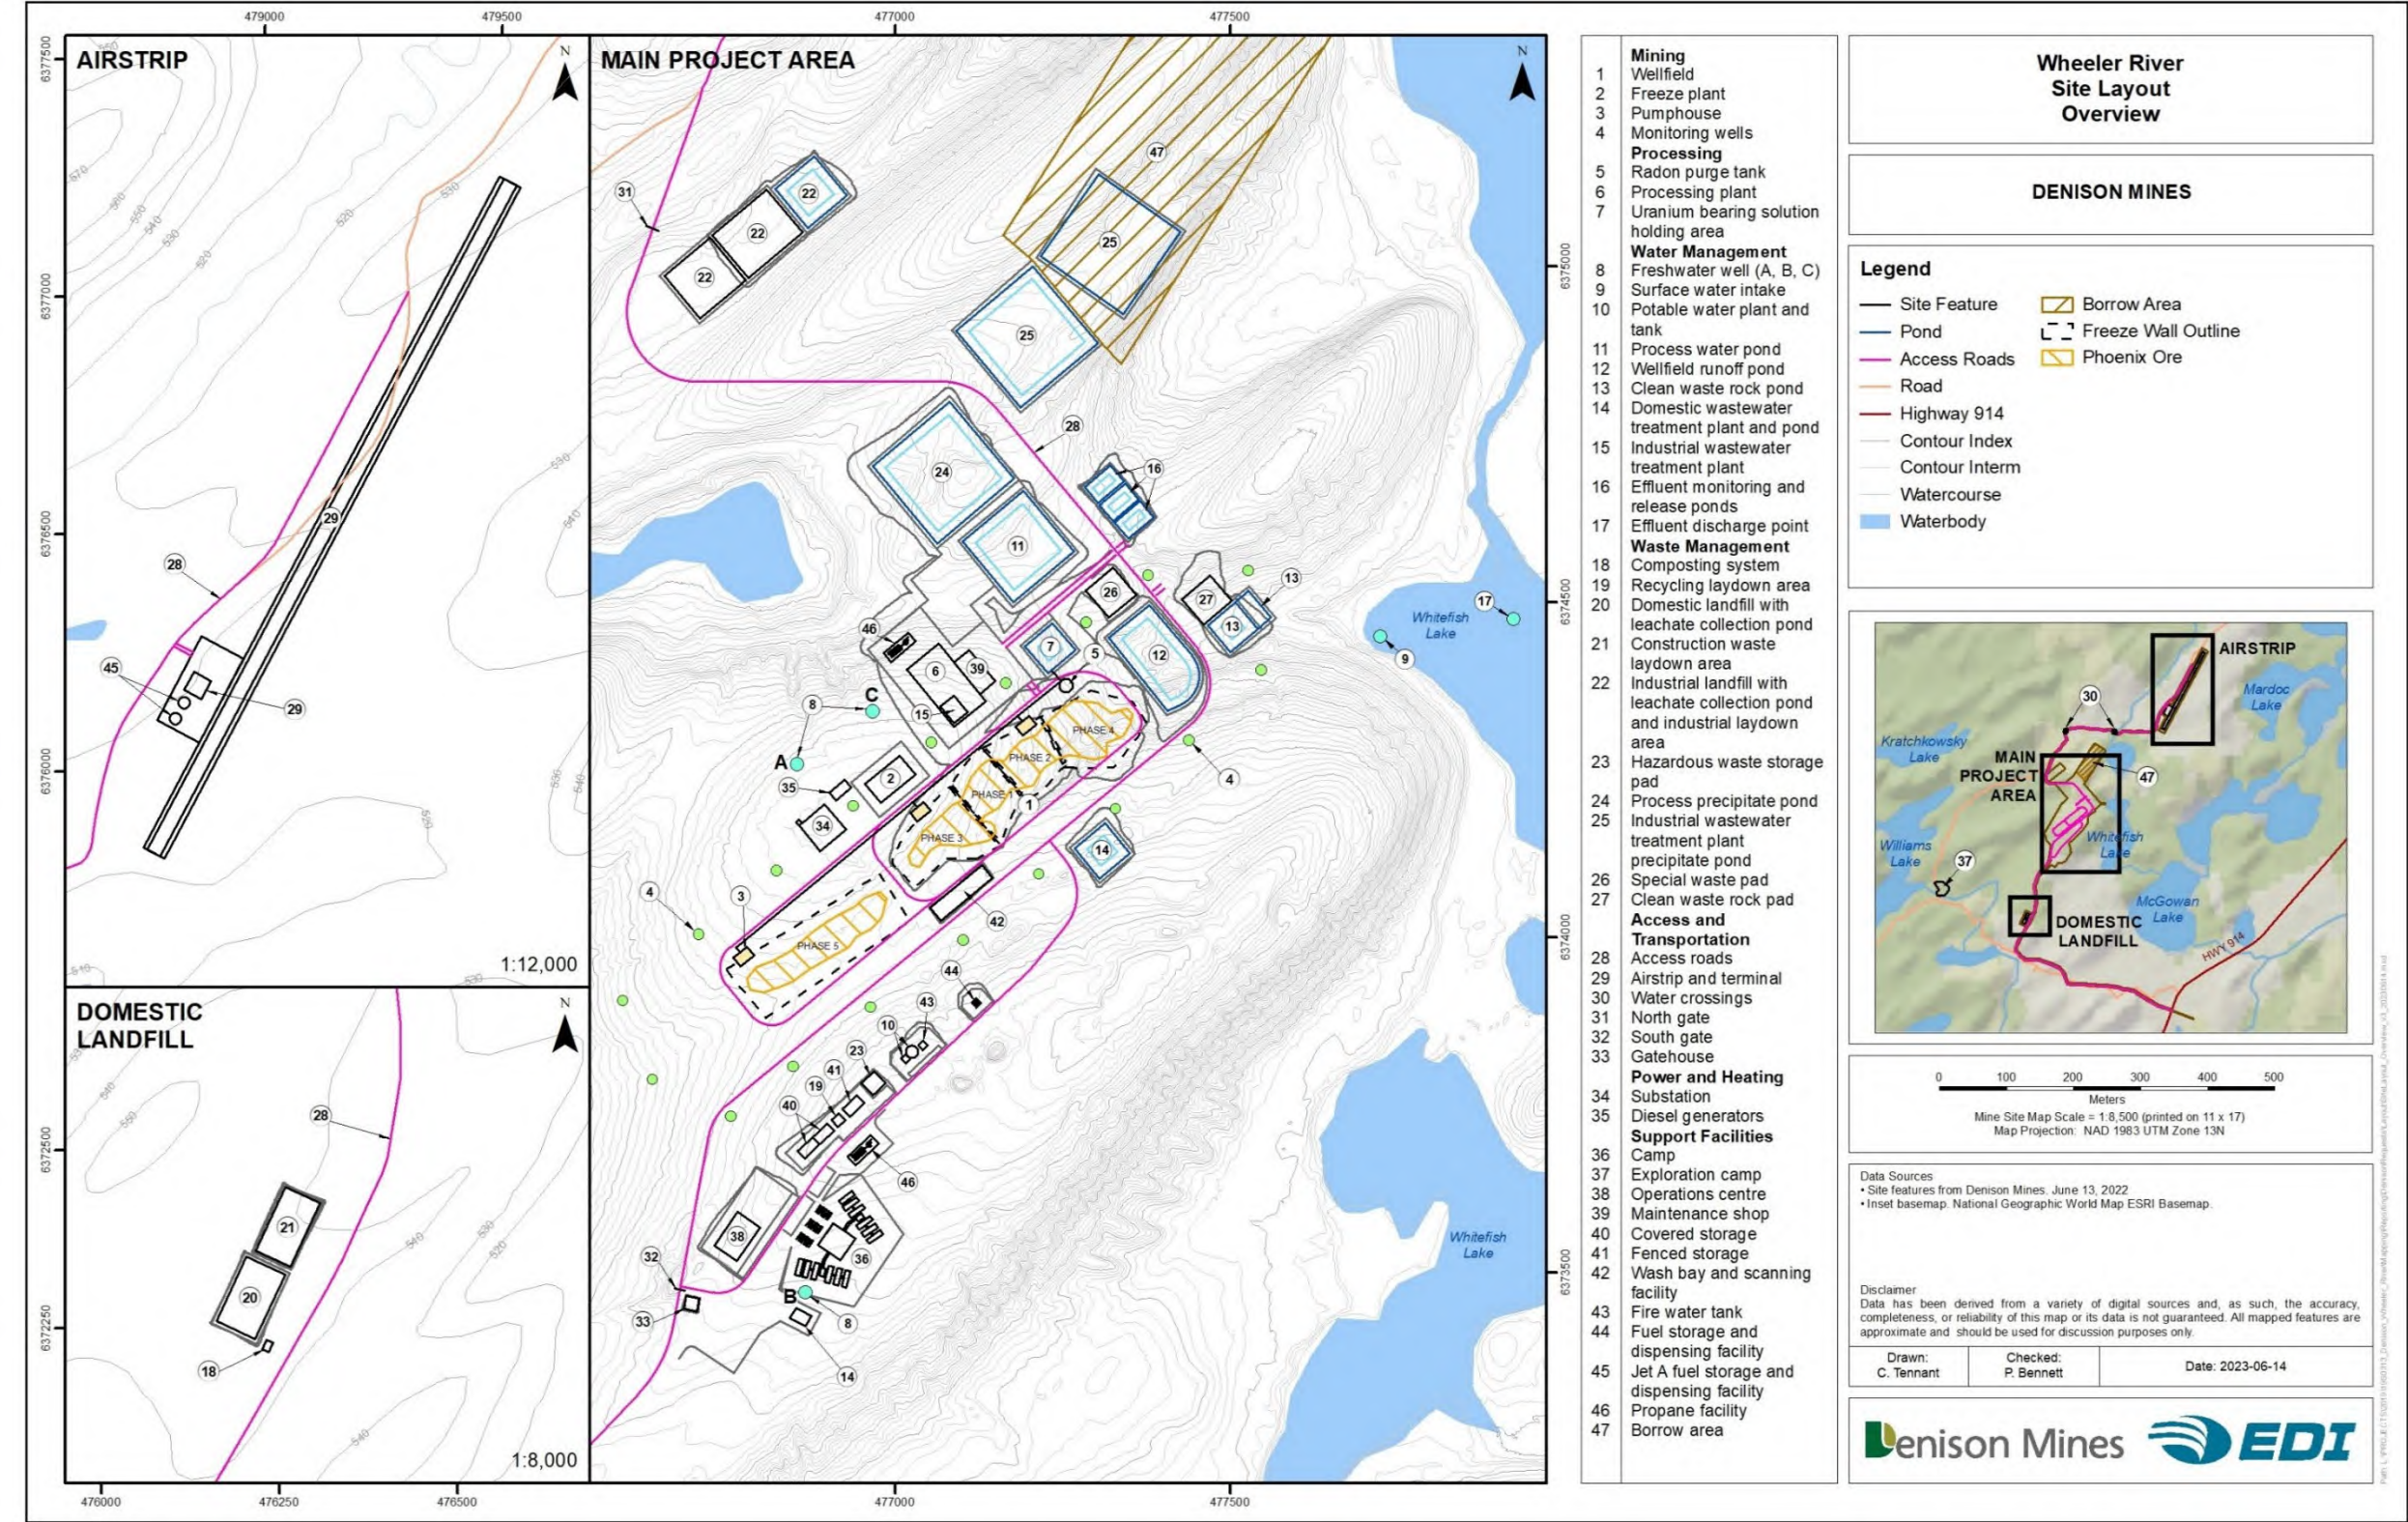

Figure 3: Wheeler River Project Proposed Site Layout

### 3.4.2.1 Mining

The uranium deposit is geologically situated at or above the unconformity between the Athabasca Basin sandstone and older basement rocks, approximately 400 m below the surface. The deposit has an average thickness of 5 m and extends approximately 750 m in length. Mining will be completed using an ISR method. A water-based low pH or acidic mining solution is injected from surface pumphouses via a series of injection wells, entering the uranium deposit mining area (approximately 400 metres below surface) via slotted well screens installed at the base of the injection wells. As the mining solution travels from an injection well towards a recovery well, uranium contained in the host rock is dissolved and transported to surface within the mining solution.

The mining solution will be prepared on site by adding reagents, likely sulphuric acid, hydrogen peroxide, and ferric sulphate, to water. Water will be sourced from either a shallow groundwater well or Whitefish Lake. The concentration of reagents required to create the mining solution will be based on previous field and laboratory test work.

The mining solution will be pumped underground to the uranium deposit via an injection well and recovered as uranium bearing solution (UBS; i.e., mining solution now containing dissolved uranium) through a series of recovery wells. Once UBS is recovered to surface, it will be pumped into the processing plant where the uranium will be removed. Typical extraction flow rates of the UBS are estimated to range up to 10 L/s and the production capacity is not expected to exceed 12 million pounds of  $U_3O_8$  per year during Operation. Mud rotary and diamond drilling, both well-established drilling techniques, are expected to be used to create the holes for the injection and recovery wells that make up the wellfield and the holes for various monitoring wells (Figure 4). Figure 5 provides an overview of Denison's current conceptual well installation sequence based on current level of engineering. Specific details may change as the Project advances through engineering design stages. The wellfield will comprise a series of injection and recovery wells in the general arrangement of one recovery well in the centre surrounded by four injection wells (Figure 5). The final wellfield is expected to include approximately 300 injection and recovery wells over an area measuring 90 m wide x 750 m long.

The mining area has been defined for this Project as the area inside the freeze wall (described below) and up to 50 m above the uranium deposit. Groundwater flow at the depth of the deposit (~400m below surface) moves at a rate of less than 1 meter/year. Containment of the mining solution and uranium bearing solution within the mining area will be achieved through a defence-in-depth approach with three levels of containment:

1. Design and operation of the injection and recovery wells

The wells are designed with both an outside and inside casing which will minimize the potential accidental release of mining solution or UBS into the sandstone above the mining area. The wells will be constructed of materials resistant to the mining solution that meet well design

specifications. Wells will be pressure grouted from the ore zone to surface and tested for mechanical integrity to confirm they are functioning properly. Operation of the wellfield will allow for monitoring of pressure changes and any pressure losses can be quickly identified by operators.

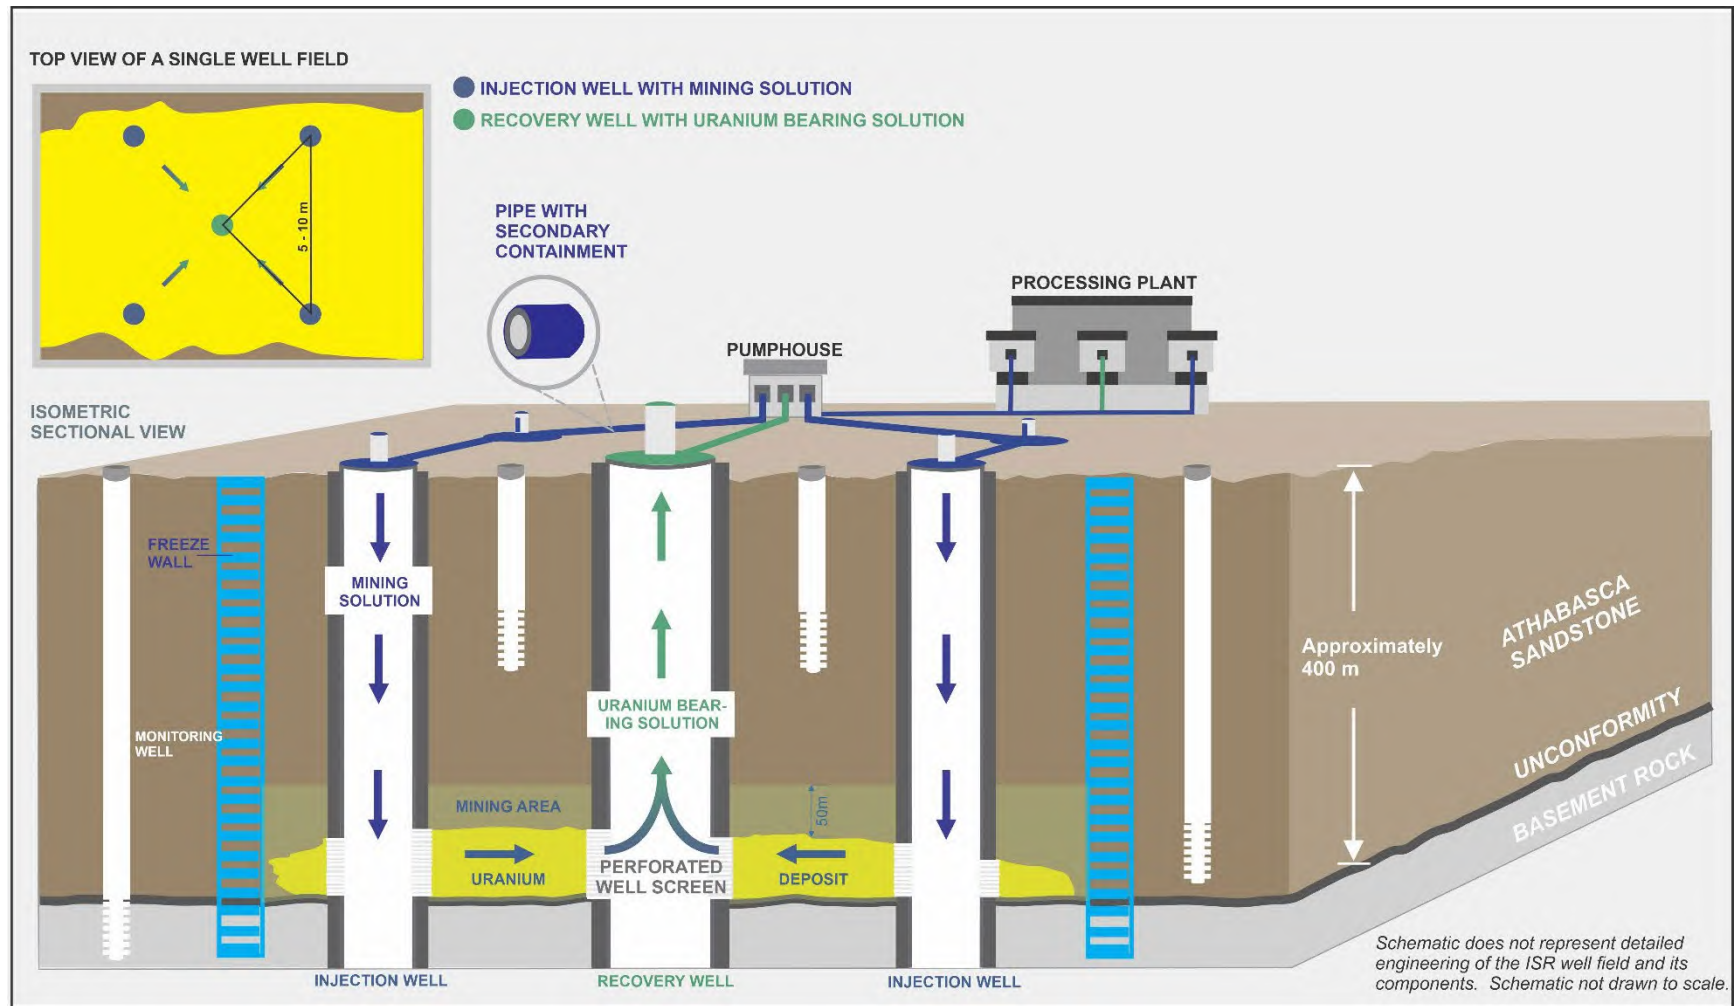

## 2. Inward hydraulic gradient from wellfield operation

A hydraulic gradient will be present in the mining area as the mining solution is pumped from an injection well (areas of high pressure) towards a recovery well (areas of low pressure). This consistent gradient in pressure causes the solutions to preferentially flow towards the low-pressure areas in a controlled manner. Hydrogeologic studies and models have been completed and show that mining solution within the mining area can be controlled by maintaining an inward hydraulic gradient.

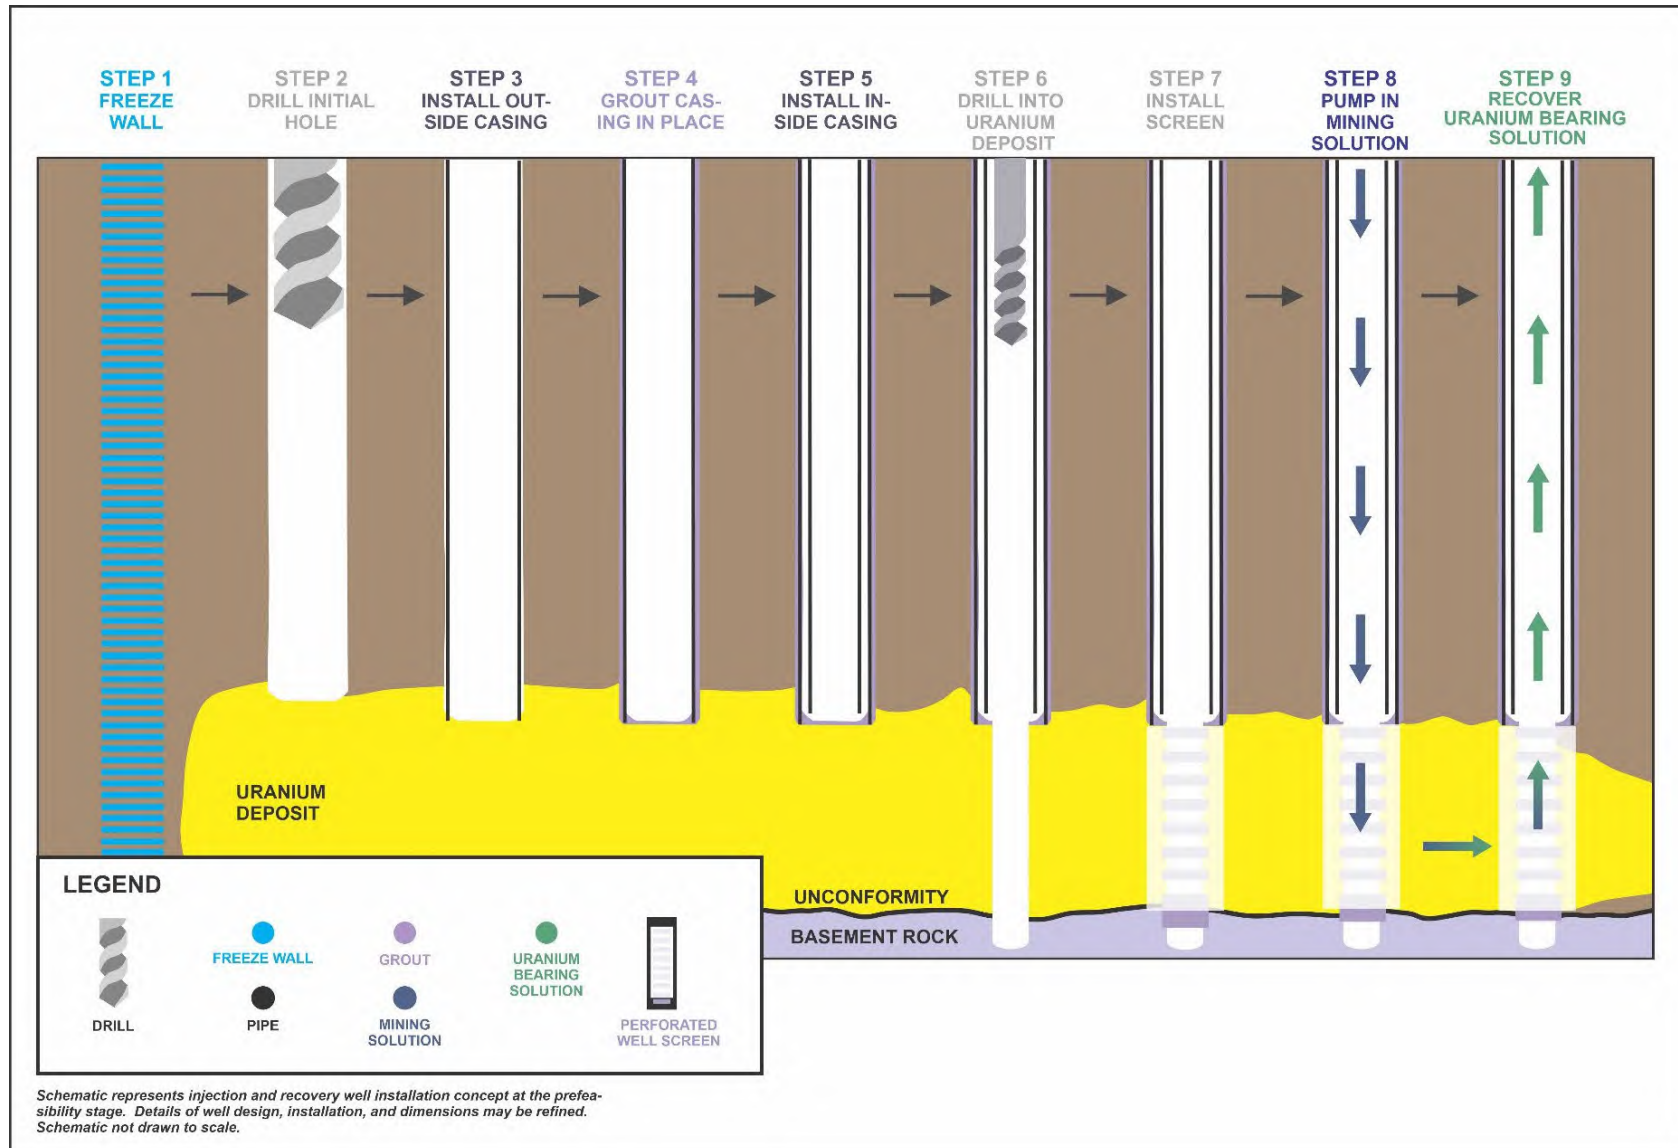

## 3. Creation of a freeze wall

Denison is proposing a freeze wall for tertiary containment of the mining solution. The engineered freeze wall will extend from the surface of land down to the basement rock below the depth of the uranium deposit. The very low permeability basement rock underlying the uranium deposit serve as a natural aquitard; however, the sandstone hosting the uranium deposit is permeable and groundwater can flow horizontally through the deposit. Ground freezing technology is well established throughout the world. Its use in a mining environment was pioneered in Saskatchewan's potash mining industry for shaft sinking activities, and later adapted for use in Saskatchewan's uranium industry. Ground freezing to control and eliminate groundwater from entering the mining areas is a fundamental component of two existing Athabasca Basin underground uranium mines: Cameco Corporation's McArthur Operation and Cigar Lake Operation. The freeze wall for the Project will be established ahead of the commencement of mining activities by drilling vertical holes (using common diamond drilling methods) from surface to the basement rock. These holes will be cased and outfitted to allow for the recirculation of a freeze brine, which will gradually reduce the temperature of the ground near the drill hole and ultimately freeze the water within the rock to create a continuous in-ground freeze wall around the perimeter of the mining area. A total of over 300 freeze holes are planned for the Project. Once completed, the freeze wall will create a physical boundary around the mining area that will completely isolate it from the surrounding regional groundwater.

Groundwater monitoring wells will be configured to demonstrate effective containment of solution within the mining area and provide early warning of any vertical migration of the mining solution or UBS within the perimeter of the freeze wall. Additional monitoring wells will be positioned to monitor groundwater pressures and quality outside of the mining area, including outside of the perimeter of the freeze wall. Monitoring groundwater conditions along the freeze wall perimeter also serves to monitor any loss of freeze capacity of the freeze wall. Groundwater samples taken outside of the mining area during Operations are expected to be comparable to regional groundwater quality.

**Figure 4: Overview of the In Situ Recovery Process**

**Figure 5: Proposed Injection and Recovery Well Installation Sequence**

### 3.4.2.2 Processing

Processing of the UBS to Triuranium Octoxide or  $U_3O_8$  (often referred to as the final uranium product or yellowcake) will take place in the processing plant. Denison's processing plans are based on numerous metallurgical tests completed as part of preliminary engineering activities.

When the UBS comes to surface, radon gas will naturally migrate out of solution and into the atmosphere. To keep radiation exposure of process plant worker as low as reasonably achievable (ALARA,) a radon purge tank will be used to remove an initial volume of radon before the solution enters the processing plant. A holding area for the UBS will be designed to safely store the UBS on surface prior to processing to allow for a controlled flow of UBS into the plant.

The processing plant includes a two stage precipitation circuit:

The first process precipitate circuit is designed to remove non-uranium constituents, including iron and radium-226 from the UBS. Process precipitates will be radioactive and contain between 2 to 3% uranium which is considered economical as feed for other mills in Saskatchewan. The process precipitates will be safely and temporarily stored on site for eventual off-site reprocessing and final disposal at an approved facility.

Then, through a series of tanks and filters, and with the addition of reagents, the uranium contained in the UBS is precipitated, dried, and packaged via the uranium circuit.

The final product will be transported off site to customers. Water generated in the processing plant will be treated in the industrial wastewater treatment plant to meet regulatory requirements, and either be recycled for use in the wellfield or process plant or released to Whitefish Lake.

An overview of the processing plant is provided in Figure 6.

### 3.4.2.3 Water Management

Water management for the Project involves distribution of freshwater, collection of runoff water, recycling and treatment of process water, and collection and treatment of industrial and domestic wastewater. As part of Denison's approach to sustainable mining at the Project, Denison intends to recycle process water to the greatest extent possible, thereby reducing the demand for fresh water supply and reducing the volume of treated effluent released.

A freshwater distribution system will be designed to provide fresh water for the fire water system, the potable water treatment plant (WTP), the processing plant including mining solution preparation, the wash bay, drilling, and batch plant operation. Water will be sourced from either a shallow groundwater well or Whitefish Lake.

A process water pond, double-lined with leak detection, has been designed to capture water from a variety of areas, including the process precipitate storage pad and special waste pad. The pond will be designed to hold up to 30,000 m<sup>3</sup> of water and will be located next to the processing plant. The pond will be able to receive water from all site ponds and monitoring wells. If required, water in this pond can be used directly in the process plant or be directed to the industrial wastewater treatment plant (IWWTP), located in the processing plant building.

Domestic wastewater, including greywater (e.g., water drained from sinks, showers, washing machines) and blackwater (i.e., sewage), will be generated at site will be piped or pumped to the on-site domestic wastewater treatment plant (DWWTP). Treated effluent from the DWWTP pond will be routed to the process water pond.

A three-stage IWWTP will be used to treat potentially contaminated waters produced from the processing plant and other various sources (e.g., wash bay sump water, leachate from the industrial landfill, wellfield runoff pond), routed to the IWWTP through the process water pond.

The first stage of water treatment will produce a radioactive precipitate which will be stored and handled with the precipitates generated in the process precipitate removal circuit, as they will be similar in composition. The second stage of water treatment will generate non-radioactive IWWTP precipitates, which will be permanently disposed of on site in an appropriately designed pond. At decommissioning, the non-radioactive material in the IWWTP precipitates will be covered and decommissioned in place. The third stage of water treatment is neutralization.

It is Denison's intent to incorporate treated water (to the extent possible) back into the mining water balance as make-up water in the processing plant to generate additional mining solution. Any excess treated water from the IWWTP will be pumped to the effluent monitoring and release ponds.

Denison plans to construct and operate three effluent monitoring and release ponds, which will receive treated water from the IWWTP. There will also be an option to recycle water from these

ponds back into the processing plant via the process water pond. Each pond will be operated with the following stages: 1) filling, 2) holding while awaiting quality confirmation, and 3) releasing to Whitefish Lake once water quality is confirmed to meet discharge limits. All effluent released to surface water will meet federal and provincial regulatory discharge criteria.

#### 3.4.2.4 Waste Management

Conventional waste, radiologically contaminated waste, and hazardous waste will be managed at the Project. Denison is committed to conducting stringent waste characterization throughout the life of the Project. This includes physical, radiological, and chemical characterization to maintain accurate waste inventories and determine how wastes will be dispositioned through either re-use, recycling, temporary storage, or permanent disposal (on or off site). This includes clearance of waste or materials that meets unconditional release requirements and can be safely removed from site.

Drilling activities will generate small volumes of two types of waste rock (drill cuttings): clean waste rock from the sandstone and special waste rock for the area close to the uranium deposit. Both waste rock types will be handled appropriately on surface, including contact water management. Clean waste rock will be used where possible in construction and special waste rock will be processed through the processing plant or disposed of off site.

The processing plant and IWWTP will generate two types of precipitates: process precipitates which have uranium and radioactivity, and the IWWTP precipitates which are non-radioactive.

Two waste landfills are included as part of the proposed Project. The design and operation of these facilities is consistent with best management practices both at northern Saskatchewan mine sites and from comparable jurisdictions. The two landfills are the:

- Domestic Waste Landfill
- Industrial Waste Landfill

The domestic landfill will have a composite liner system with leachate collection. The landfill will be fenced, contoured to direct runoff away from the facility, and managed to avoid attracting wildlife and birds.

The industrial landfill will have a double geosynthetic composite liner system. There will be an associated leachate collection pond immediately north of the industrial landfill, which will have a double liner system with leak detection. Radiologically material from operational activities that cannot be cleaned to pass radiological clearance (e.g., used wellfield piping, laboratory waste) will be disposed of in the industrial landfill and classified as low level radioactive material.

Additionally, a small pad designated for temporary storage of hazardous waste such as paints, solvents, hydrocarbons, and used oil, will be required to support the Project. The temporary

storage pad will have a composite liner system. Hazardous wastes will be stored temporarily on this pad before being taken off site by waste management service providers for proper recycling or disposal.

#### 3.4.2.5 Access and Transportation

Mainland access to the site will be from Highway 914. A 7-km section of road will be constructed from the highway to the Project site and a 5 km long road will also be constructed from the Project site to the proposed airstrip. Additional site roads will include a service loop to the camp.

As a proposed fly in-fly out operation, the Project will require an airstrip to bring personnel to and from the site. A 1,600-m long airstrip is proposed to be positioned in a natural and relatively flat valley northeast of the Project site.

Access to the Project Area will be controlled by both a north and south security gate. The main, south gate will be located close to the operations centre and staffed as required. The north gate will be a simple locked gate.

#### 3.4.2.6 Power

Electrical service to the Project will be provided via an approximate 5-km extension tap from the existing 138 kV overhead transmission line that runs along Highway 914. The transmission line service owned and operated by SaskPower will terminate at an onsite electrical substation. Optimization of the precise line route will be completed as the Project advances.

Power transmission to the site (e.g., assessment, obtaining necessary permits, and construction) will be led by SaskPower is considered ancillary to this Project. Diesel generators will be installed to service the site and maintain essential functions during a power outage.

#### 3.4.2.7 Support Facilities

The following support facilities will be constructed on the Project site (see Figure 3):

- camp;
- operations centre;
- covered and fenced storage;
- wash bay and radiological clearance scanning area;
- fire water system;
- facilities to support hazardous substances management:
  - fuel storage and dispensing facility;
  - propane facility;
- borrow area.

### 3.4.3 Project Schedule and Activities

The proposed Project schedule and activities according to phase are summarized in Table 1.

**Table 1: Project Phase, Year, and Associated Activities**

Phase and Year	Description of Activities	
Construction Year 1 to 3	<ul style="list-style-type: none"> <li>• Development of access roads and air strip</li> <li>• Site preparation and earthworks; clearing, leveling and grading of the project area</li> <li>• Power generation – generators</li> <li>• Installation of main substation and distribution of power around site</li> <li>• Wellfield and freeze hole drilling; ground freezing</li> <li>• Batch plant operation (concrete); crusher at borrow area</li> <li>• Development of surface infrastructure (camp, operations centre, plants, ponds, pads and support facilities)</li> <li>• Waste management (composting, domestic and industrial landfill operation, recycling)</li> <li>• Water management (including treatment and site run-off)</li> <li>• Groundwater supply</li> <li>• Surface water withdrawal</li> <li>• Fuel management (e.g., propane for comfort heating; vehicle and aircraft fuel)</li> <li>• On-site and off-site operation of vehicles and transport of materials</li> <li>• Air transportation for workers</li> <li>• Regulatory site inspections</li> <li>• Engagement - site visit from Interested Parties</li> <li>• Employment and expenditures</li> </ul>	
Operation Year 3 to 18	<ul style="list-style-type: none"> <li>• Operation of the ISR wellfield</li> <li>• Wellfield and freeze wall drilling</li> <li>• Operation and expansion of freeze wall</li> <li>• Batch plant operation (grout and cement); crusher at borrow area</li> <li>• Expansion of pond and pads</li> <li>• Operation of the processing plant and production of uranium concentrate</li> <li>• Water withdrawal from groundwater or surface water body</li> <li>• Management of surface water (including seepage and site run-off)</li> <li>• Water treatment, both domestic and industrial</li> <li>• Water release to surface water body</li> <li>• Waste management (composting, domestic and industrial landfill operation, recycling)</li> <li>• Hazardous waste management (temporary storage, handling, and off-site transportation)</li> <li>• Storage and disposal of drill waste rock, process precipitates and industrial wastewater treatment plant precipitates</li> <li>• On-site and off-site operation of vehicles and transport of materials</li> <li>• Power supply – primarily power from the grid, also generators and back-up generators</li> <li>• Package and transport of nuclear substances</li> <li>• Fuel management (e.g., propane for comfort heating; vehicle and aircraft fuel)</li> <li>• Air transportation for workers</li> <li>• Progressive decommissioning and reclamation</li> <li>• Regulatory site inspections</li> <li>• Engagement - site visit from Interested Parties</li> <li>• Employment and expenditures</li> </ul>	
Decommissioning Year 18 to 23	<ul style="list-style-type: none"> <li>• Site water management, treatment, and release</li> <li>• Mining horizon remediation and thawing of freeze wall</li> <li>• Process water treatment and release</li> <li>• Power generation – generators</li> <li>• Waste management (composting and landfill operation)</li> </ul>	

Phase and Year	Description of Activities	
	<ul style="list-style-type: none"> <li>• Closure of ISR and freeze wells and related infrastructure</li> <li>• Decontamination of surface facilities and injection, recovery, and monitoring wells</li> <li>• Asset removal (including site power transmission lines and electrical infrastructure)</li> <li>• Demolition and disposal of non-salvageable surface infrastructure and materials</li> <li>• Remediation of surface areas (wellfield, pads, ponds, domestic wastewater treatment location, and process plant area)</li> </ul>	<ul style="list-style-type: none"> <li>• Decommissioning of landfills; hazardous materials management (temporary storage and off-site disposal)</li> <li>• On-site and off-site operation of vehicles and transport of materials</li> <li>• Reclamation of disturbed areas</li> <li>• Regulatory site inspections</li> <li>• Engagement - site visit from Interested Parties</li> <li>• Employment and expenditures</li> </ul>
Post-Decommissioning Year 23 to 38	<ul style="list-style-type: none"> <li>• Environmental monitoring</li> <li>• Regulatory site inspections</li> </ul>	<ul style="list-style-type: none"> <li>• Engagement - site visit from Interested Parties</li> <li>• Employment and expenditures</li> </ul>

### 3.4.4 Management Systems

A detailed management system, based on the CNSC's safety and control areas and focused on anticipated compliance verification criteria, will be developed to support licensing activities. For the EIS, an Environmental Management System (EMS) framework is provided to support review of the assessment and provide confidence in the significance determinations and overall conclusions.

Denison would develop an EMS for the Project consistent with the principals set out by CAN/CSA ISO 14001, *Environmental Management Systems – Requirements with Guidance for Use*, with consideration to applicable provincial and federal requirements and consideration of other guidance as may be deemed appropriate.

In general terms, the EMS is a framework that provides the means to proactively manage environmental risks and opportunities. The EMS provides processes, procedures, policies, assigned roles and responsibilities, and considers continual monitoring and improvement of organizational structures and practices. Within the specific context of the Project, the EMS provides an overall perspective on how potentially adverse effects would be minimized and managed over the Project life. In addition, the EMS establishes expectations (and associated mechanisms) for contractors and sub-contractors to comply with environmental commitments and policies including auditing and enforcement programs.

Denison is responsible for, and committed to providing, sufficient resources to: develop and implement the EMS to meet statutory/regulatory requirements; meet its corporate expectations with respect to environment performance; meet the expectations of its Interested Parties,

including Indigenous communities, with respect to environment performance; and fulfill any commitments made through the EA process and beyond through all Project phases.

Various Project design features have been proposed that serve to eliminate, reduce, or control potential Project effects on the biophysical and human environments through all Project phases.

### 3.4.5 Project Alternatives

Denison first evaluated potential production from the Project in 2010. Since that time, the Project has undergone significant design and review stages and has naturally evolved into the Project described herein. During the planning process, it is common to consider various means by which to fulfill a specific aspect of the Project.

Alternative means are the various ways Denison considered to implement Project components and activities. A systematic assessment of these alternatives is used to select preferred alternatives that are carried forward as Project design elements. These preferred alternatives ultimately become the basis upon which potential Project-related effects are evaluated in the EIS. The alternative means assessment was carried out as follows:

1. Identification of Alternative Means: Project components for which alternate means were considered are identified;
2. Consideration of Technical and Economic Feasibility: the technical and economic feasibility of these alternate means is considered—only alternate means that are deemed technically and economically feasible are carried forward;
3. Potential Residual Effects Associated the Alternative Means: the potential residual effects of each alternative, in consideration of mitigation, are described; and,
4. Evaluation of Alternative Means: a comparative evaluation of alternative means takes place that considers the potential residual effects for each alternative relative to various assessment criteria and indicators.

Based on these steps, a preferred alternative means for each respective Project component or activity evaluated was selected. Input received from Indigenous people and other Interested Parties was integral to the alternatives means assessment.

The alternative means assessment is conducted at a screening level, as is appropriate given the stage at which Project planning was when the alternatives were considered. The assessment considered both quantitative (where possible) and qualitative information available at the time. In addition, the comparative evaluation identified alternatives that were more preferred versus those which were less preferred.

As an example, five mining methods were evaluated through an increasingly rigorous process and considered factors such as: safety, environment, production rates, capital costs, operating costs,

schedule, operational flexibility, and risk. The top four mining methods considered for the Phoenix deposit were: jet boring, surface boring, micro tunnel boring, and ISR. Independent preliminary economic assessment or class 5 level assessments were completed on each of these four options in 2017. Ultimately, the alternative assessment results showed that ISR had advantages over boring and the other options including fewer environmental effects, lower costs, fewer technical risks, fewer safety risks for worker and positive feedback from Communities of Interest. Denison selected the ISR mining method for the Phoenix deposit in the 2018 prefeasibility study (PFS; Denison2018). Subsequent test work has validated the selection of the ISR mining method and accordingly, the ISR mining method was selected as the basis for the EA for the Project.

### 3.4.6 Greenhouse Gas Emissions

The Government of Canada requires that greenhouse gas (GHG) emissions be assessed in support of any project seeking federal approval. The GHGs that are required for emissions reporting include carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), and nitrous oxide (N<sub>2</sub>O), which are reported on an annual basis.

Direct or scope 1 emissions associated with combustion sources (e.g., using diesel or gas in mobile equipment, burning propane for building and process heat) are the main source scope 1 GHG emissions anticipated at the Project, with a minor contribution from the loss of a vegetation associated with the development of the Project Area during the first year of Construction. Indirect or scope 2 emissions are associated with the generation of electricity required to power the Project. Total emissions (direct and indirect) across all Project phases were estimated to be below 0.031 Mt CO<sub>2</sub>e per year. For comparison, the average annual province-wide total GHG emissions (2014 to 2019) were 75.2 Mt CO<sub>2</sub>e. The majority of GHG emissions in Saskatchewan as a percentage of province-wide totals are from the oil and gas sector (30%), agriculture (24%), Electricity (20%), and transportation (15%).

Denison will look to optimize the use of energy, including the potential to reduce combustion sources from fossil fuels through further electrification or alternative energy sources during upcoming engineering and design phases.

### 3.4.7 Project Benefits

The Project will provide an input source of uranium to nuclear power plants, contributing to clean energy production globally. The amount of uranium produced during the life of mine from the Project could supply power to 1 000 000 Canadian homes for 100 years. (WNA, 2022, Stats Can, 2019).

Direct financial benefits will be realized by the Province of Saskatchewan through royalties during the Operational phase of the Project. Additionally, federal and provincial governments will benefit from corporate and personal income tax collected as a result of mining the operation.

Denison will concentrate initial and sustained efforts towards employment and training initiatives for the Project targeted at the Communities of Interest. Best efforts will be made to make sure employment is maximized within the Communities of Interest and beyond that, with Indigenous people and Residents of Saskatchewan's North. Denison will work with the leadership of the Communities of Interest to assist in determining appropriate hiring practices during all phases of the Project.

Approximately 300 workers are expected to be required during Construction. During Operation, about 180 people will be employed annually to operate the wellfield and processing plant, and provide various supporting activities such as security, camp operations, operation of the water treatment and potable water plants, environmental monitoring, and maintenance of roads, equipment, and buildings.

Positions expected throughout Construction and Operation include supervisory and management positions, trade positions, professional and technical positions, as well as labour positions. Training applicable for various positions is offered through Saskatchewan Indian Institute of Technologies, Saskatchewan Polytechnic, and other institutions in northern Saskatchewan. Specific training for the Project will be developed through a systematic approach including a needs analysis.

Denison has established a procurement approach that requires the procurement of all goods and services for the Project to first consider businesses based within the Communities of Interest prior to looking elsewhere in northern Saskatchewan, southern Saskatchewan, and/or outside of Saskatchewan. Throughout all phases of the Project, Denison will prioritize procurement efforts within the immediate vicinity and region.

Programs and actions focused on producing socio-economic benefits for Communities of Interest have been initiated for the Project. Denison's corporate Indigenous Peoples Policy (IPP) reflects the company's belief that reconciliation is advanced through collaboration with Indigenous peoples and communities to build long-lasting, respectful, trusting, and mutually beneficial relationships, while aspiring to avoid adverse effects of Denison's activities and operations (Denison 2021).

### 3.4.8 Indigenous Knowledge

Denison recognizes the value Indigenous Knowledge (IK) and Local Knowledge (LK) adds to project planning, the completion of the EIS, and throughout the lifespan of the Project. Denison has recorded and stored information regarding IK, LK, and engagement activities in an Engagement Database referenced throughout the EIS. Indigenous perspectives can be complementary to the Cumulative Effects Assessment (CEA) for the Project. ERFN and KML have shared their Indigenous Knowledge on past, present, and predicted cumulative effects, through the following sources:

- *Wheeler River Project – Summary of Health and Socio-Economic Study Results* (ERFN and SVS 2022a);

- *Wheeler River Project - Summary of Traditional Knowledge Study Results* (ERFN and SVS 2022b); and
- *Kineepik Valued Ecosystem Components – KML Pre-statement for Denison EIS* (KML and NVP 2022).

The Métis Nation – Saskatchewan shared their Métis knowledge study which included secondary literature approved for use by the MN-S and primary information collected during interviews with nine Métis citizens from Northern Region 1 (NR1) and Northern Region 3 (NR3), as the following source:

- *The Wheeler River Project: Métis Knowledge Study Report* (MN-S and Two World Consulting 2023).

The Ya'thi Néné Lands and Resources Office also shared a report with Denison that, focused primarily on the Athabasca Denesųliné First Nations including Hatchet Lake, Black Lake, and Fond du Lac, as the following source:

- *An Exploration of Recorded Athabasca Denesųliné Traditional Knowledge, Land Use and Occupancy Information in the Vicinity of Denison Mines Wheeler River Project* (Ya'thi Néné Lands and Resources Office 2022).

Denison has brought this Indigenous Knowledge and Traditional Knowledge together with western science throughout the EA process. Additionally, Denison is supporting several processes to aid community-led collection of IK. These processes are at different stages of completion. Denison will continue to consider and integrate results from any forthcoming materials provided by communities as it advances the EIS process.

## 4 Summary of Engagement

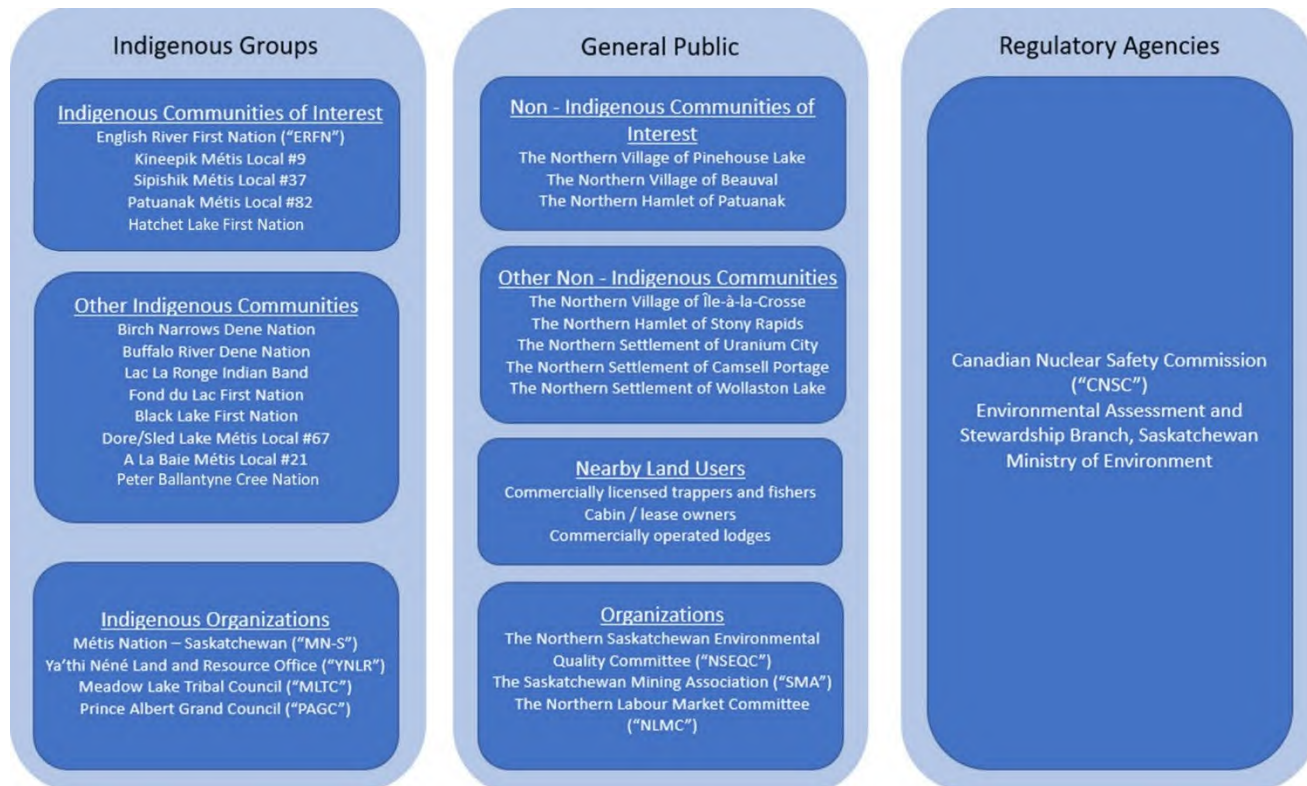

### 4.1 Introduction

Denison understands the importance of engaging with local and Indigenous communities, residents, businesses, organizations, land users and the various regulatory authorities, which are collectively referred to herein as Interested Parties. Since 2016, Denison has engaged with Interested Parties to develop meaningful relationships and facilitate a collaborative approach to engagement and the advancement of the project. Interested Parties are further categorized into three broad groups, each with several sub-categories:

- Indigenous Groups
  - Indigenous Communities of Interest (COI)
  - Other Indigenous Communities
  - Indigenous Organizations
- General Public

- Non-Indigenous COI
- Other Non-Indigenous Communities
- Nearby Land Users
- Organizations
- Regulatory Agencies

A list of the Interested Parties for the Project can be found below.

**Notes:**

- 1 The Métis Nation – Saskatchewan (MN-S) holds the delegated Duty to Consult for Dore/Sled Lake Métis Local #67 and A La Baie Métis Local # 21, Sipishik Métis Local #37 (SML), and Patuanak Métis Local #82 (PML).
- 2 Engagement activities with the Athabasca Basin First Nations and Communities (Fond du Lac, Black Lake, Hatchet Lake, Stony Rapids, Camsell Portage, Uranium City and Wollaston Lake) occur through YNLR.

Denison has developed and implemented an engagement plan to guide and structure engagement activities related to the Project.

The implementation of the engagement plan for the Project has faced various challenges, most notably the COVID-19 pandemic. Adopting an adaptive approach has been key to the successful implementation of an effective and meaningful engagement process for Interested Parties.

Additionally, in 2021, Denison announced the adoption of the IPP (Denison 2021). The IPP reflects Denison's recognition of the important role of Canadian business in the process of reconciliation with Indigenous peoples in Canada and outlines Denison's commitment to take action towards advancing reconciliation. The IPP was developed based on Denison's experiences with, as well as feedback and guidance received from, Indigenous communities with whom Denison is actively engaged. This approach was designed to make sure the IPP appropriately captures a mutual vision for reconciliation. The IPP identifies five key areas of action that support the ongoing development of a continuously evolving Reconciliation Action Plan (RAP): Engagement; Empowerment; Environment; Employment; and Education. Through the RAP, Denison is striving to interweave the principles of reconciliation throughout all areas of the company's operations.

## 4.2 Engagement Approach and Methods

Interested Parties are categorized into three broad groups, each with several sub-categories. These include Indigenous Groups, the General Public, and Regulatory Agencies. As part of our adaptive approach, engagement activities for each of these groups of Interested Parties have been tailored to comply with both federal and provincial regulatory legislation and, importantly, meet the expectations of each Interested Party.

Engagement is defined as the sharing and gathering of project-related information from Interested Parties, and the collaboration with Interested Parties, in good faith, with the goal of developing mutually acceptable resolutions to issues identified. Developing authentic relationships with Interested Parties to facilitate productive engagement is expected to play an integral role in the long-term success of the Project.

Engagement activities for the Project can and will evolve over time – as information is gathered that is pertinent to Denison's understanding of the Interested Parties and their relationship to, and interest in, the Project.

Engagement methods have included in-person, remote (audio only, virtual, and digital), and print and have generally occurred in alignment with the following phases:

- Pre-Project Description (April 2016 to May 2019);
- Post-Project Description (July 2019 to October 2022);
- Environmental assessment outcomes and relationship to licensing/approvals (October 2022 to January 2024); and
- Future Activities (following Final EIS Submission).

Planned methods of engagement were reviewed in March 2020 in response to the onset of the COVID-19 pandemic in Canada. Activities that included direct in-person interaction, such as site visits, were not possible in 2020 and 2021 and necessitated a shift to a remote style of engagement.

For each engagement activity, any perspectives that were shared by an Interested Party were recorded and consolidated into a single Engagement Database. Since 2016, this has culminated in over 2,000 unique entries, comprised of stand-alone comments, questions, queries, issues, concerns or other. The perspectives associated with the unique entries have been, where appropriate, interwoven into and throughout elements of the EA for the Project, highlighting how engagement outcomes have influenced various considerations in the EIS. Where appropriate, appendices of EIS sections contain summary tables that provide details on each unique entry that has been used in or otherwise informed an element of that section of the EIS, including information on issues raised and Denison's responses.

### 4.3 Engagement with Indigenous Groups

Denison is committed to conducting meaningful engagement with Indigenous communities and organizations potentially affected by the Project, and to maintain collaborative relationships with these communities and organizations throughout all phases of the Project.

Indigenous peoples have a unique relationship with the environment, and importantly, Indigenous and Treaty Rights, which must be fully respected during the process of Project development, Construction, Operation, and Decommissioning. To this end, Denison's objectives with respect to Indigenous engagement associated with the Project are as follows:

- build and maintain relationships built on trust and transparency;
- create a respectful dialogue that promotes communication between Denison and Indigenous communities and organizations, in a timely and accurate fashion; and
- understand how the proposed development of the Project may affect the ability of Indigenous peoples to exercise collective Indigenous/Treaty Rights.

Consistent with the history associated with other uranium mining projects located within the Northern Administration District (NAD; Figure 7), Denison recognizes that many Indigenous communities located within the NAD typically have some level of interest in uranium mining activities. Given potentially varied interests of multiple Indigenous communities, criteria was established to guide the development of the engagement program.

Through a process of (i) discussion with potentially interested Indigenous groups, (ii) consideration of applicable criteria, and (iii) interaction with representatives of the SK MOE and the CNSC, Denison identified the following Indigenous Communities of Interest:

- English River First Nation (ERFN);
- Kineepik Métis Local #9 (KML);
- Sipishik Métis Local #37;
- Patuanak Métis Local #82; and

- Hatchet Lake First Nation.

To formalize Denison's early commitment to work together, Memoranda of Understanding were signed with some communities and organizations in 2018. More recently, participation and funding agreements have been reached to provide capacity for interested parties to actively participate in the environmental assessment process.

Denison recognizes other Indigenous communities exist with potential interests in the Project, including Indigenous communities that have been identified by a Regulatory Agency as having a potential interest in the Project. These other Indigenous communities have been identified to include Birch Narrows Dene Nation, Buffalo River Dene Nation, Lac La Ronge Indian Band, Fond du Lac First Nation, Black Lake First Nation, Peter Ballantyne Cree Nation, Dore/Sled Lake Métis Local #67, and A La Baie Métis Local #21.

Denison also recognizes certain Indigenous organizations offer a single point of contact to member communities to facilitate information sharing and collection. In many cases these organizations have been delegated the right to represent an Indigenous community or group of Indigenous communities in connection with the Project. The four Indigenous organizations that have been identified include the Métis Nation – Saskatchewan (MN-S), Ya'thi Néné Lands and Resource Office (YNLR), Meadow Lake Tribal Council (MLTC), and Prince Albert Grand Council (PAGC). The Project is located within the MN-S homeland.

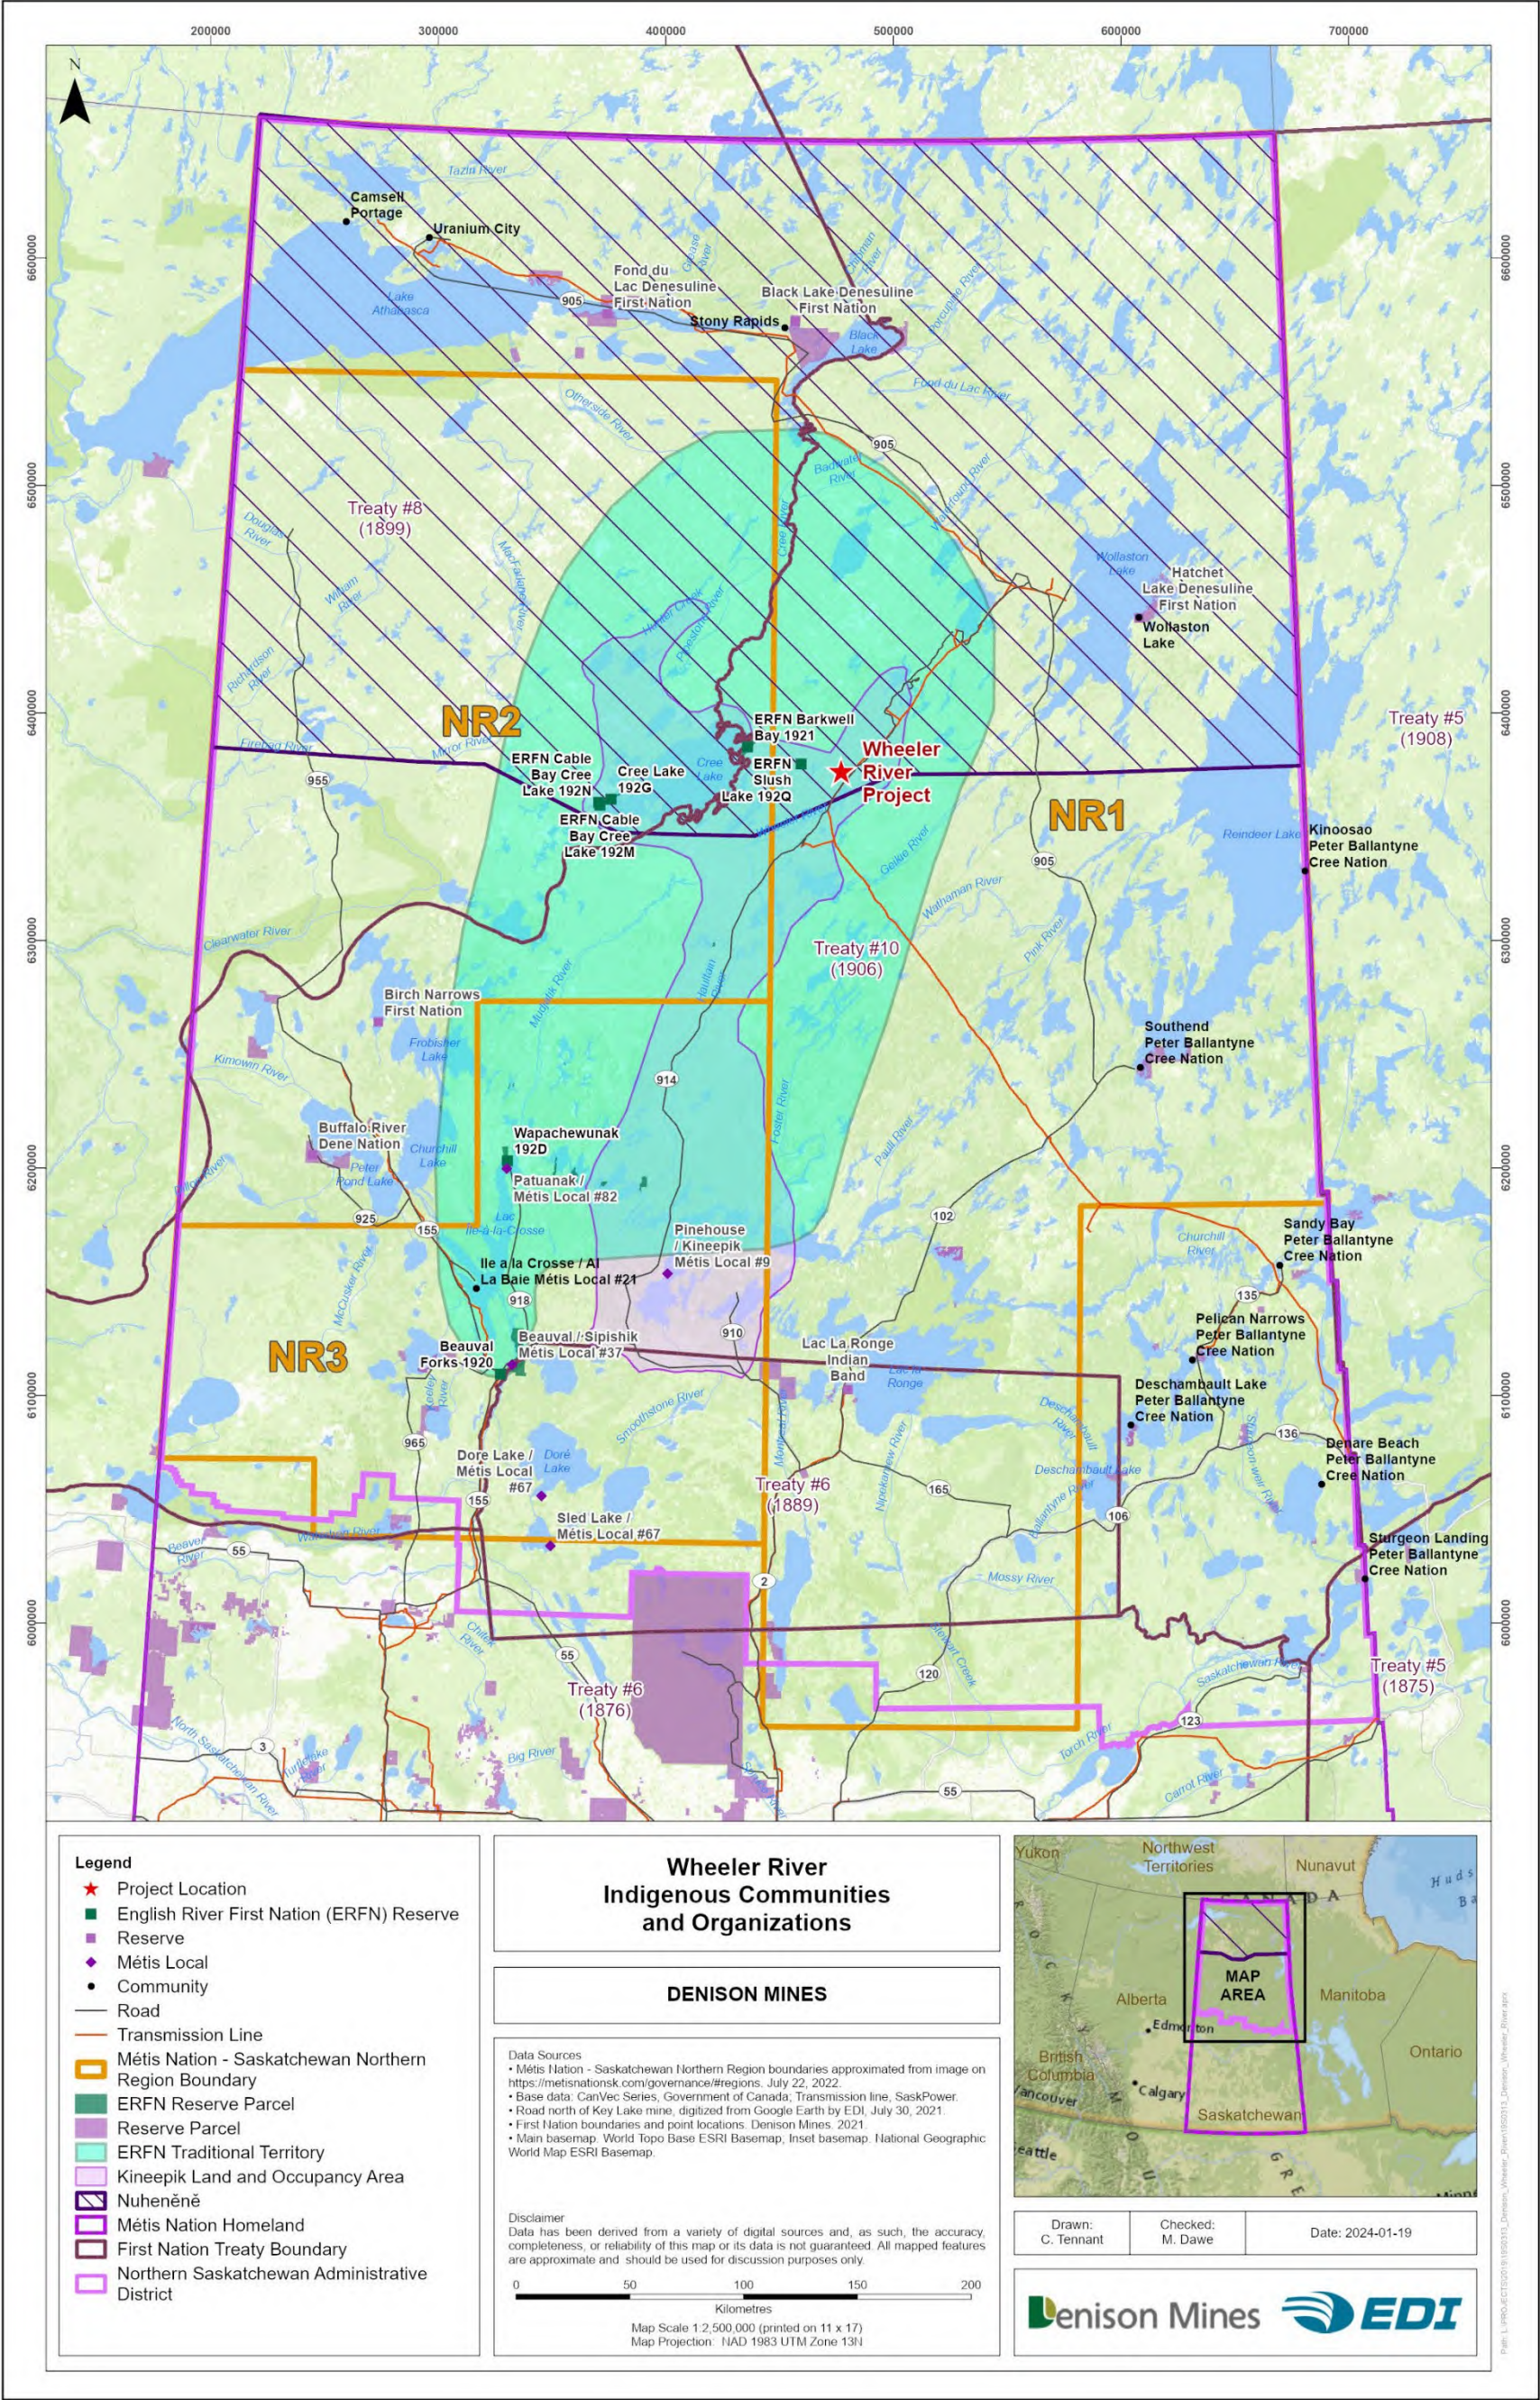

Figure 7: Identified Indigenous Communities and Organizations

A summary of engagement activities with each of the Indigenous Communities of Interest is provided in Table 2 and key results from engagement with Indigenous Groups are summarized in Table 3.

**Table 2: Summary of Engagement Activities with Indigenous Community of Interest**

Year	Engagement Activity	Total Number				
		English River First Nation (ERFN)	Hatchet Lake First Nation (HLFN)	Kineepik Métis Local #9 (KML)	Sipishik Métis Local #82 (SML)	Patuanak Métis local #82 (PML)
2016	Meeting	2		1	1	
2018	Workshop	1		1	1	
2019	Site Tour	1		1	1	1
	Meeting		1	1	1	1
2020	Due to the development of the Covid-19 pandemic, Denison suspended the EA and related engagement activities in 2020.					
2021	Virtual Meeting	3	1	From 2019, the MN-S has been representing Kineepik Métis Local #9, Sipishik Métis Local #37 and Patuanak Métis Local #82 in respect of engagement with Denison for the Project.		
	Virtual Leadership Meeting		1			
	Nuhtsiye-kwi Benéne Committee Meeting	3				
	Survey	1	1			
2022	Open House	2		1	In late 2021, Kineepik Métis Local #9 revoked their delegated Duty to Consult to the MN-S and Denison re-engaged directly with them	
	Leadership	1		1		
2023	Meeting	1	1	2		
	Site Tour	1		1		
2024	Workshop	1				
	Meeting		1	1		
	Site Tour			1		

**Note:** Before 2019, Denison undertook engagement activities in the Patuanak area (including with Patuanak Métis Local #82) more broadly through work done in relation to the ERFN Wapachewunak reserve, consistent with the strong interconnections in the area.

**Table 3: Key Results from Engagement with Indigenous Groups**

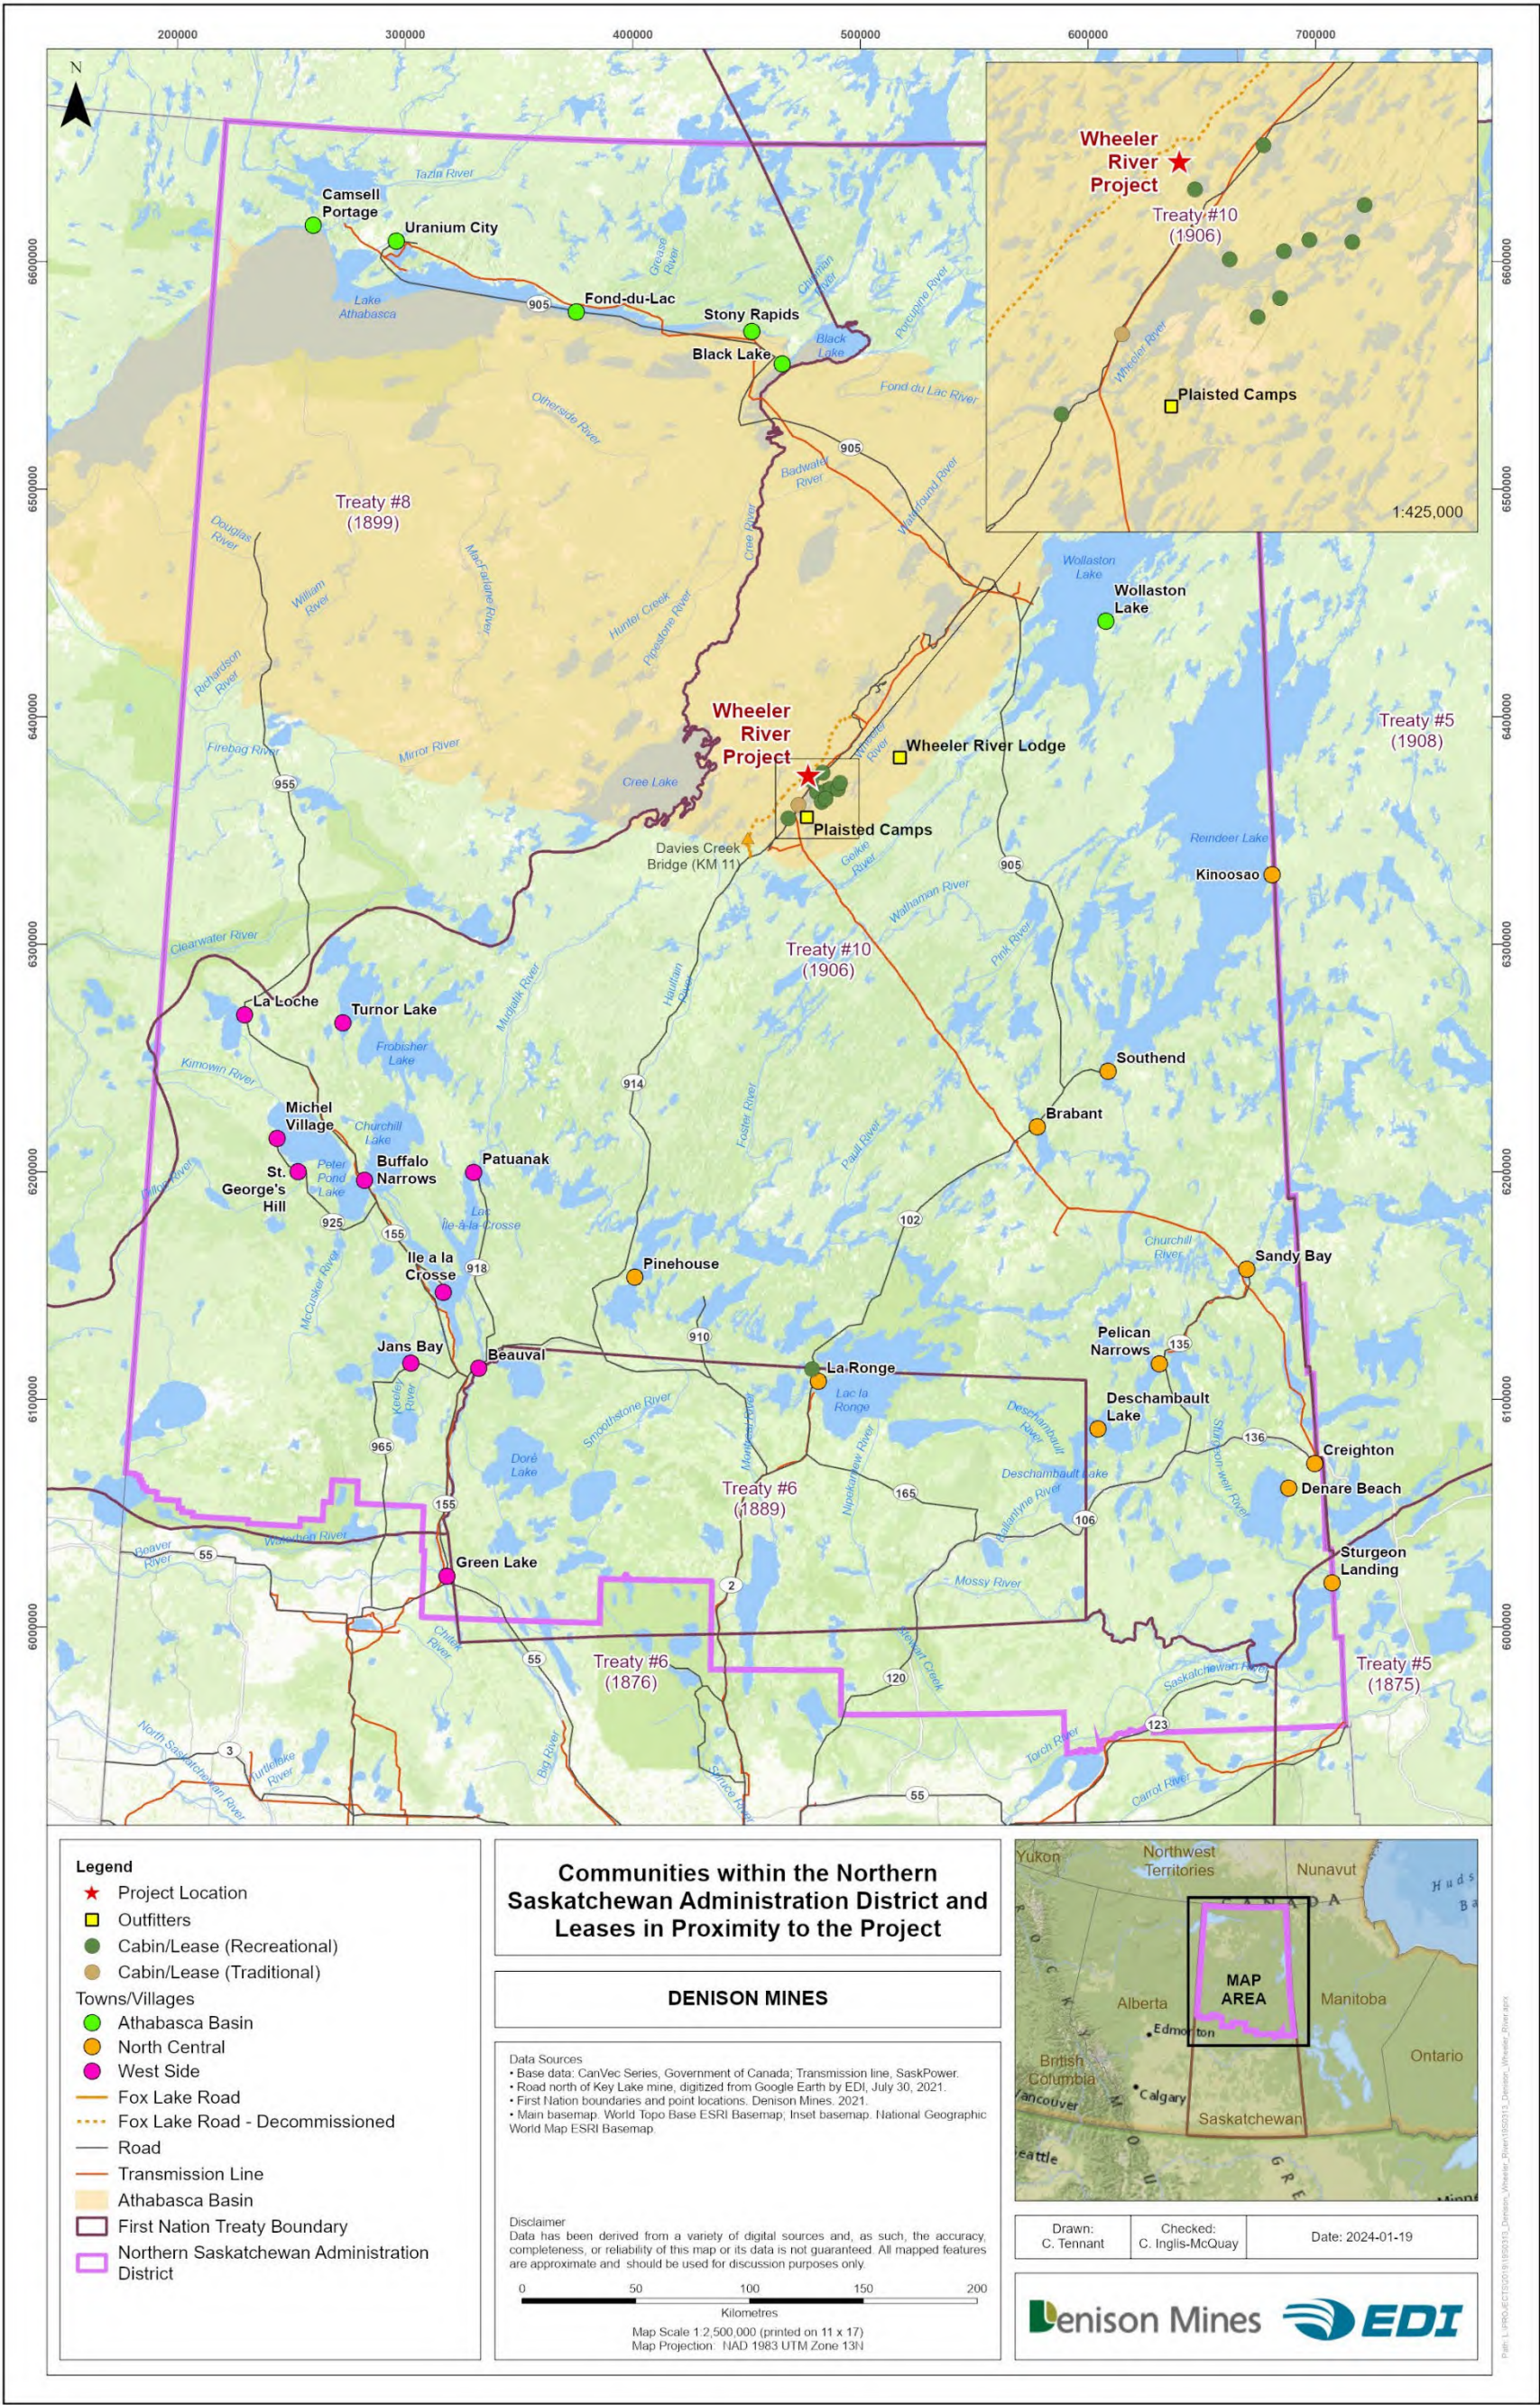

Topic	Summary of the Issue, Interest, or Concern	How Comment was Addressed/Considered in the Draft Environmental Impact Statement
Project Description	Questions and clarifications on ISR mining methodology, including freeze wall technology and Project power requirements.	<b>Section 2</b> provides information about the ISR mining method, freezing technology and wastewater treatment process.
Economics	Concern and interest in economic opportunities associated with the Project and education and training to facilitate access to employment.	<b>Section 13</b> summarizes local, provincial, and federal Project benefits and Denison's approach to employment, training, and business participation opportunities for communities.
Human Health	General concerns are expressed about radiation levels, and treated effluent quality in relation to overall water quality in the area.	<b>Section 8</b> provides information on expected effluent release and how this will be mitigated and monitored. <b>Section 10</b> provides information on how potential human health effects of the Project are considered, mitigated, and monitored.
Indigenous Knowledge	Concern for the appropriate inclusions of Indigenous knowledge in the assessment process	<b>Section 3</b> describes how the inclusion of Indigenous Knowledge was approached across all topics in the assessment process.
Terrestrial - Wildlife	Concerns were shared about the potential effects of Project construction on wildlife, including possible effects on game for hunting. Noted desire to document pocket (location) for caribou calving as well as an ongoing role in the mitigation of any possible effects.	<b>Section 9</b> describes existing wildlife environment and anticipated effects associated with Construction, as well as plans for ongoing mitigation and monitoring.
Aquatic	Interest in understanding existing water flows and existing fish species composition, size, and quality.	<b>Section 8</b> provides information on the baseline study program that was completed to understand aquatic species present today and documents any differences before, during, and after the Project.
Water	Effects to surface water quality and quantity from effluent release and water taking, including groundwater.	<b>Section 8</b> describes how surface water quality and groundwater is considered within the EIS, including in relation to withdrawals.
Land Use	Interest in sharing Indigenous Knowledge and history, and integration of this information in EIS.	<b>Section 11</b> documents how and what Indigenous Knowledge was shared and how it was integrated throughout the EA process. <b>Section 13</b> provides more information about the traditional economy and how it was integrated in the economic assessment of the Project.
Quality of Life – Community Wellbeing	Concern with racism and other factors in workplace affecting employee retention.	<b>Section 12</b> describes the various policies and programs in place to support worker and community well-being, along with worker rotation.
Monitoring	Interest in having transparency of environmental monitoring data for operating mines.	<b>Section 16</b> describes anticipated monitoring programs and approach.
Cumulative Effects Project Description	Interest in understanding cumulative effects associated with the construction of the processing facility and the potential to accept material from other deposits or companies.	<b>Section 2</b> provides information about the Project development elements. <b>Section 16</b> summarizes project cumulative and residual effects.

#### 4.4 Engagement with the General Public

The General Public includes (i) Non-Indigenous Communities of Interest, which are located near existing transportation infrastructure used by the Project (Figure 8), and (ii) nearby Land Users, such as commercial trappers or fishers, cabin/lease owners, or commercially operated lodges, are in the vicinity of the Project. Several relevant groups or organizations represent various of the general public interests relevant to the Project.

Engagement activities with these Interested Parties have included information sharing, in-person and virtual meetings, workshops, and site visits. In some cases, opportunities to confirm specific elements relative to the Project, such as nearby land use activities, have informed aspects of the EA.

The main forms of engagement with the General Public included correspondence to share information with leadership, community meetings, a workshop on early infrastructure options, a site visit, two online surveys (2021 and 2022), and a meeting and information session on preliminary effects and mitigation. Due to the COVID-19 pandemic, engagement switched to virtual meetings in 2020/2021. In mid-2022, appropriate engagement activities moved back to in-person. Key results from engagement with the general public are summarized in Table 4.

**Table 4: Key Results from Engagement with the General Public**

Topic	Summary of the Issue, Interest or Concern	How Comment was Addressed/Considered in the Draft Environmental Impact Statement
Project Description	Questions and clarifications on ISR mining methodology, road options, and waste.	<b>Section 2</b> provides information about the ISR mining method, wastewater treatment and road options.
Economics	Concern and interest in economic opportunities associated with Project and education and training to facilitate access.	<b>Section 13</b> summarizes local, provincial, and federal Project benefits and Denison's approach to employment, training, and business participation opportunities for communities.
Human Health Quality of Life	Questions were asked about hauling of products, what routes would be used and concern over radioactivity.	<b>Section 12</b> provides information on the traffic and road infrastructure considerations of the Project. <b>Section 10</b> Human Health provides information on the considerations for human health and safety (including radiation exposure).
Aquatic	Interest in information about surface water sampling programs.	<b>Section 8</b> describes how surface water quality is considered within the EIS.
Land and Resource Use	Russell Lake was noted of particular importance for recreational/ commercial fishing.	<b>Section 11</b> provides information on how the Project will interact with land and resources including how potential effects will be mitigated.
Quality of Life – Community Wellbeing	Concern with racism and other factors in workplace affecting employee retention.	<b>Section 12</b> describes the various policies and programs in place to support worker and community well-being, along with worker rotation.
Monitoring	Interest in having transparency of environmental monitoring data for operating mines.	<b>Section 16</b> describes anticipated monitoring programs and approach.
Cumulative Effects Project Description	Interest in understanding cumulative effects associated with the construction of the processing facility and the potential to accept material from other deposits or companies.	<b>Section 2</b> provides information about the Project development elements. <b>Section 16</b> summarizes project cumulative and residual effects.

## 4.5 Engagement with Regulatory Agencies

The Project will undergo a joint provincial-federal EA process led by SK MOE's Environmental Assessment and Stewardship Branch and the CNSC. As both the Provincial and Federal government entities are involved in the assessment and regulatory process, Denison began engaging with the CNSC and the SK MOE in 2018 to provide staff an overview of the Project.

Denison holds regular (monthly) meetings with the CNSC and the SK MOE to discuss the proposed components of the Project, the EA approach and assessment methodologies. Additionally, Denison ensures the regulatory agencies are provided with the opportunity to attend Denison's engagement activities with other Interested Parties (either virtually or in-person). Attendees from the CNSC and SK MOE have attended most of Denison's key engagement activities with Interested Parties in 2019 (site visit), 2020 / 2021 (virtual meetings), 2022 and 2023 (in-person meetings and site visits), and 2024 (in-person meetings). Denison plans to continue this approach during the Future Activities engagement phase (following Final EIS Submission).

## 4.6 Future Engagement Activities

Denison believes that the development of positive and effective working relationships with Interested Parties will not conclude with the completion of the environmental assessment and licensing process, but that it is iterative and ongoing. Denison is committed to offering sustained opportunities for engagement with Indigenous communities and organizations, the general public, and regulatory agencies throughout the Project lifespan, and adapting and adjusting those activities on an as-needed basis.

# 5 Overview of the Environmental Assessment

## 5.1 Approach and Methodology of the Assessment

Denison considers the EA to be a planning and decision-making tool that assesses the potential effects of the Project in a careful and precautionary manner, so that mitigation can be designed and applied to support the approval of the Project by the appropriate regulators (i.e., SK MOE and the CNSC). As such, the EA is a process for identifying the Project's potential interactions with the biophysical and human environment, predicting adverse effects, identifying mitigation measures, and evaluating residual and cumulative effects remaining after mitigation. The EA also outlines the proposed efforts for monitoring and reporting to verify compliance with the terms and conditions of approval and the follow-up necessary to assess the accuracy and effectiveness of predictions and mitigation measures presented in the EA.

In carrying out the various assessments, it has been assumed that an average of 9 million pounds of  $U_3O_8$  will be produced each year with up to 12 million pounds  $U_3O_8$  produced in any individual year, and that Operation could last up to 15 years. The intent of the assessment case is to allow for a

conservative assessment of the Project and to facilitate operational flexibility from one year to the next.

The EA approach involves “overlaying” the Project onto the existing environment to identify and describe whether, how, and to what degree components of the environment are likely to change due to the Project. Changes remaining after mitigation measures have been considered are called residual effects, and these are the changes that are further evaluated and characterized (Figure 9).

The key elements of the EA for the Project involve:

- defining the scope of the assessment in terms of Valued Components (VCs), selected Key Indicators (KI) for each VC, Measurable Parameters (MPs), and the spatial and temporal boundaries for the assessment;
- identifying the influence of Indigenous Knowledge, local knowledge, and engagement on the assessment (see Section 4);
- describing the existing environment for each VC;
- determining which Project components and/or activities interact with the VCs;
- determining potential Project effects and applicable mitigation measures (e.g., design features) and operational methods that will be used to avoid or limit adverse effects resulting from the Construction, Operation, Decommissioning, and Post-Decommissioning activities of the Project;
- completing a residual effects evaluation (e.g., characterizing anticipated adverse effects remaining after implementing appropriate mitigation);
- determining the significance, when applicable, of the identified adverse residual effects;
- identifying cumulative effects, i.e., the spatial and/or temporal overlapping of residual Project effects with the same residual effects resulting from other past, present, and reasonably foreseeable projects or activities (including characterization of cumulative effects and significance determination);
- describing monitoring and follow-up programs that will be completed; and
- summarizing, in plain language, the main points of the assessment, including potential residual and cumulative effects to the VC/KI from the Project and relevant mitigation, monitoring and follow-up.

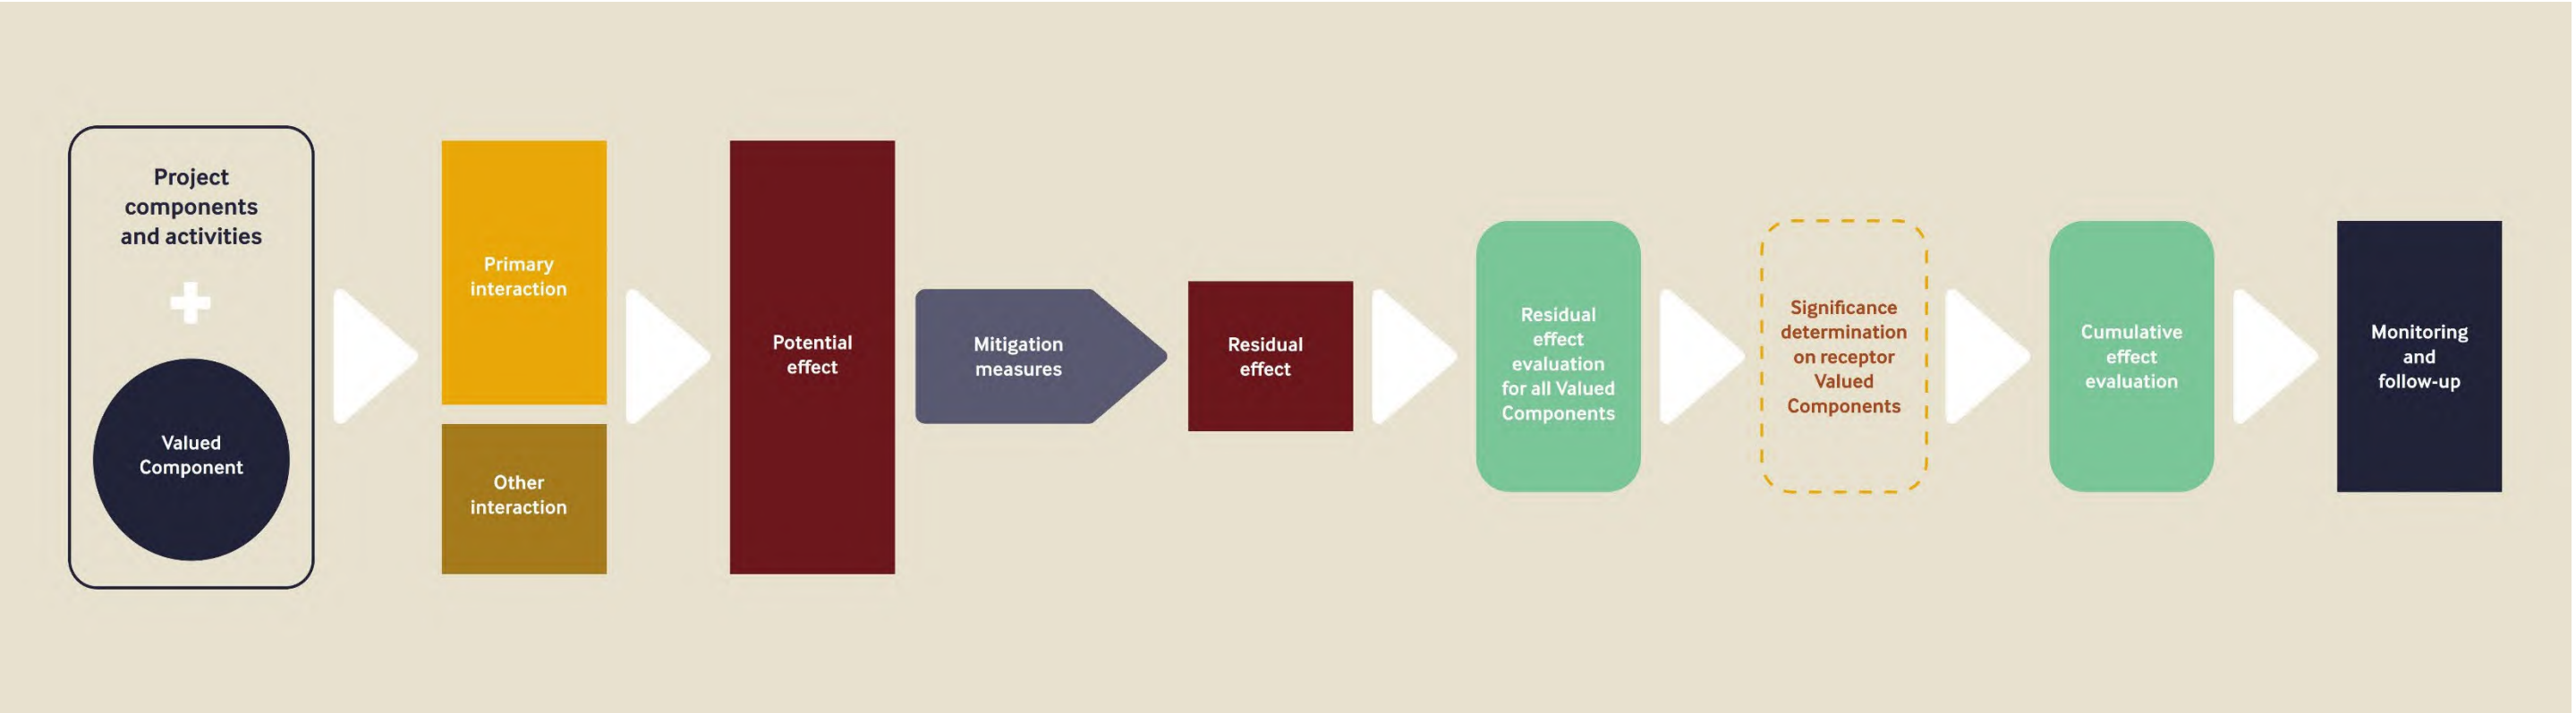

Figure 9: Steps to Completing the Environmental Assessment for the Project

### 5.1.1 Valued Components, Key Indicators and Measurable Parameters

The VCs are aspects of the biophysical and human environments that will likely be affected (adversely or positively) by the Project. The VCs reflect identified scientific, local and Indigenous Knowledge, and community interests regarding the Project and its potential effects. Initial direction and input into VC selection were obtained through discussions with Indigenous groups, government agencies and the public. Denison reviewed and considered this input to develop a VC list to focus the detailed assessment for the EA.

A KI is an important component or aspect of the VC that is expected to be affected (changed) as a result of the Project. A MP is parameter or metric associated with the KI that can be used to detect and measure Project-related changes.

### 5.1.2 Spatial Boundaries

Spatial boundaries for the EA were defined for each VC, based on the extent of the anticipated Project-related effects (i.e., direct and indirect) on the VC. When determining the spatial boundaries, the following information was considered, as appropriate and available:

- Indigenous and local knowledge and engagement;
- information on current land and resource use by Indigenous communities;
- other pertinent ecological, technical, social, and cultural considerations (e.g., watersheds, ecozones);
- input from federal and provincial regulators and the public; and
- professional expertise of Denison and qualified third-party expert consultants.

The study areas for this EA were identified for each VC according to the following definitions:

- **Project Area** (see Figure 2): the area within which the Project and all components/activities are located (i.e., the Project footprint; the area of maximum physical disturbance). This area is not VC-specific, but consistent throughout the EA.
- **Local Study Area (LSA) – specific for each VC:** the area that surrounds the Project Area where both direct and indirect effects resulting from Project activities can be reasonably measured. The LSA is established to assess the potential, largely direct effects of the Project and represents the extent to which there is a reasonable potential for the Project or Project-related activities to interact with and potentially adversely effect the VC.
- **Regional Study Area (RSA) – specific for each VC:** the area that surrounds and includes the LSA, established to assess the potential, largely indirect, effects of the Project in a regional context. The RSA is large enough to capture the extent of potential effects (i.e., zone of influence) on a VC and defines the area within which cumulative effects may occur (i.e., cumulative effects assessment boundary).

### 5.1.3 Temporal Boundaries

The Project has four primary temporal boundaries or phases to be considered in the EA (Figure 10).

**Figure 10: Four Temporal Boundaries/Phases for the Project**

Additionally, a “future centuries” scenario is considered to assess the potential effects post-restoration (i.e., beyond the Project timeline of 0 to 38 years) and to reflect the time period over which the highest constituents concentrations in groundwater are predicted to migrate towards and interact with surface water.

For a list of activities associated with each phase of the Project, please see Table 1.

## 5.2 Atmospheric and Acoustic Environment

### 5.2.1 Air Quality

The existing air quality environment in the Project Area is typical of a remote northern setting. The baseline monitoring program for the Project indicated low existing levels of dust, nitrogen dioxide (NO<sub>2</sub>), sulphur dioxide, and radon. The Project is expected to introduce new emission sources to the area, which in turn are expected to change the ambient air environment. Predictions of air quality concentrations were completed as part of the assessment using dispersion modelling to evaluate how the anticipated Project activities may change the existing air quality environment, and what the potential effects of those changes may be.

Air emission sources associated with the Project include site clearing and construction activities, dust from use of unpaved road surfaces, fuel combustion (e.g., power generators, diesel-powered mobile equipment), drilling in the wellfield, and process operations at the ISR plant. Potential effects related to Air Quality were identified pertaining to the predicted concentrations in air of various air quality indicators, including particulate matter, combustion products, and radon.

Several mitigation measures were identified to minimize the residual effects of the Project on Air Quality. These include regular watering of unpaved roads and surfaces to suppress dust emissions, limiting vehicle speeds, equipping the process exhausts with scrubbers, and making sure stack heights are sufficiently high to prevent building downwash effects.

Results of the air quality modelling were compared to thresholds set by federal and provincial authorities pertaining to the predicted concentrations in air of various air quality indicators. Residual effects were predicted at receptors located beyond the Property Boundary for 24-hour concentrations of total suspended particulate (TSP), particulate matter (PM<sub>10</sub>), and uranium, and 1-hour concentrations of NO<sub>2</sub> during at least one Project phase. Overall, residual effects were predicted to be limited in geographic extent and mostly infrequent. The 24-hour TSP and PM<sub>10</sub> exceedances for Construction and Operation were predicted to be sporadic. Residual effects were predicted to be short-term for Construction and unlikely for Operation. For Decommissioning, 24-hour TSP exceedances were predicted to be infrequent. Exceedances of the 24-hour uranium criterion for Operation and the 1-hour NO<sub>2</sub> criterion in all three Project phases were predicted to be infrequent. There is no significance determination for the Air Quality VC, as the results for Air Quality are carried through to Aquatic, Terrestrial and Human Health assessments, where effect significance has been evaluated.

Air emissions from other reasonably foreseeable projects in the area are not expected to combine with those from the Project and increase ambient air concentrations. However, there is potential for a cumulative effect at sensitive locations near Highway 914 due to Project-related traffic and traffic from Cameco's McArthur River and Key Lake operations. A 5-km portion of Highway 914 from the Project access road and south towards Key Lake was included in the air model and emissions from Project traffic were assessed. While traffic associated with Cameco's operations was not modelled, conservative regional background concentrations were added to the air model predictions. Air emissions from Cameco-related traffic are adequately captured by the conservative background concentrations and thus considered in the assessment of Project-related effects.

To confirm the residual effects of the Project on Air Quality, and to demonstrate compliance with provincial ambient air quality standards, an adaptive air emissions monitoring plan will be implemented at the permitting and licensing stage. The air emissions monitoring plan will evaluate the effectiveness of the dust management plan.

### 5.2.2 Noise

The Project Area is currently characterized by low ambient sound levels that are primarily attributable to sounds of nature, as would be expected for a remote location. The Project is expected to introduce new sound sources of an industrial nature into this environment, which is expected to change the nature of the existing environment and result in localized increases in sound levels. Any change to the existing sound environment in the vicinity of the Project has the potential to affect Indigenous groups and the public in terms of creating nuisance noise that may affect human health and change animal behaviours as related to hunting activity.

Noise sources associated with the Project include site clearing activities, construction of facilities, power generators, diesel-powered mobile equipment, drilling in the wellfield, on-site traffic and air

traffic, chilling equipment associated with the freeze plant, and various equipment associated with the ISR process (e.g., pumps).

The assessment of Noise included a baseline monitoring program to characterize existing sound levels, and the use of predictive models to assess how the Project may affect the existing sound environment. The predicted changes to the sound environment were assessed against federal and provincial guidelines to evaluate the resulting change.

Mitigation measures included limiting the use of equipment during night-time hours where possible, planning the site layout such that significant noise sources are as far as possible from sensitive locations, and making sure generator air discharges are directed away from sensitive locations. A noise monitoring program has been recommended to evaluate the effectiveness of mitigation measures and predictions made in the assessment.

The predicted sound levels were below the threshold values from the federal and provincial guidelines at all receptor locations; however, the increase in noise from baseline conditions was predicted to be noticeable at the nearest cabin. As a conservative approach, this was carried forward as a residual effect and follow-up monitoring will be conducted. As with the Air Quality VC, the Noise VC has not been evaluated for significance. The Noise VC was carried through the Terrestrial and Land and Resource Use assessments, where a significance determination has been completed.

Noise emissions from other reasonably foreseeable projects in the area are not expected to combine with those from the Project and increase ambient noise levels. However, there is potential for a cumulative effect at sensitive locations near Highway 914 resulting from Project-related traffic and Cameco's McArthur River and Key Lake operations. A model was prepared that estimated the contributing sound levels of this amount of traffic on Highway 914 at each of the sensitive receptors. The predicted sound levels due to combined truck traffic along Highway 914 did not change the acoustic assessment results based on the federal or provincial guidelines.

## 5.3 Geology and Groundwater

### 5.3.1 Geology

Geology includes bedrock, soils, and geomorphology (i.e., the study of physical features on the earth and their relationship to underlying geological structures). Geology was recognized as an important component of the environment that may be affected by the Project, and changes to Geology could in turn lead to effects on other VCs selected for assessment. For example, terrain morphology dictates landscape function, such as surface drainage patterns, and reflects the underlying surficial (geological) materials.

Geology was considered to be an intermediate VC (i.e., does not have an assessment endpoint). Changes to this intermediate VC were evaluated to facilitate the assessment of Project

interactions, with links to other disciplines for inclusion in their assessments, including Terrestrial Environment, and Land and Resource Use.

The geological conditions are well understood based on Project-specific and regional information. The Project Area and operations have been designed to limit disturbance to the natural geological environment. One component of the geologic assessment focused on subsidence at ground surface associated with extraction of rock mass (ore) at significant depth (approximately 400 m) below ground, from within the mining area. The assessment predicted a very minor change in ground elevation in the range of 2.4 to 2.8 mm within a discrete and localized area of the Project Area. This minor change may not be measurable and is likely within the bounds of other routine operational surface disturbances. Subsidence, should it occur, will be limited in terms of vertical displacement, and localized to a small portion of the Project Area.

As assessment was completed to understand the potential cumulative effects of the Project with existing and future developments on the physical aspects of the Geology VC. No cumulative effects on the Geology VC are expected. Subsidence is expected to be limited in terms of vertical displacement, if detectable, and localized to a small portion of the Project Area that does not spatially overlap with other project footprints and their potential effects on geology.

As part of the mining operations, detailed monitoring activities will be completed to assess the performance of various components of the Project associated with engineering mining designs, subsidence, performance, and infrastructure designs to protect the Geology VC. Subsidence at ground surface within the wellfield will be evaluated from Construction through to Decommissioning, by monitoring the elevation of collars (top of pipe) for wells within the wellfield. Contingency plans, including measures for adaptive management and emergency preparedness plans, will be designed to safeguard the local environment.

### 5.3.2 Groundwater

Groundwater is an integral component of the hydrologic cycle and is considered an important component and pathway (intermediate VC) to the Surface Water VC. Groundwater was selected as a VC for assessment because it is important in maintaining ecological habitats through its influence on the hydrology and water quality of surface water bodies, including wetlands. Indigenous Knowledge and engagement activities clearly identified the importance Interested Parties place on groundwater as a pathway to surface water, and the associated potential for changes in groundwater inputs to surface water to influence Fish and Fish Habitat, Sediment Quality, Vegetation, Wildlife, Human Health, and Indigenous Land and Resource Use.

The groundwater assessment focused on predicting changes in groundwater flow patterns and groundwater table elevations (Groundwater Quantity), and concentrations of chemical constituents in groundwater that may affect local surface water environments (Groundwater Quality).

The primary potential effects from the Project on groundwater included changes to Groundwater Quantity and Groundwater Quality during Operation as a result of surface facilities (ponds, landfills, laydown and wash areas) and mining, as well as the migration of chemical constituents in groundwater from the remediated mining area as natural groundwater flow conditions are re-established in Post-Decommissioning.

The overall Project Area and Operation have been designed to limit disturbance to the natural groundwater environment outside of the immediate mining area. To minimize residual effects of the Project on Groundwater Quantity and Quality, and protect discharges to local surface water bodies, specific and established engineering design features and mitigation measures will be employed, such as liners, leak detection systems, leachate collection systems at landfills, pads, and ponds, as well as impermeable cover designs during decommissioning. The freeze wall will be established as tertiary containment before mining operations commence to create hydraulically isolated mining area. Groundwater will be remediated during Decommissioning to acceptable standards, which are referred to as mining area decommissioning objectives. These objectives reflect concentrations of mining-associated groundwater constituents that are protective of the surface water environment after giving consideration to the removal of the hydraulic isolation of the freeze wall following the decommissioning stage.

To carefully evaluate how constituents dissolved in the remediated groundwater within the mining area may migrate away from and interact with the environment, a rigorous numerical model of groundwater flow and chemical constituent behaviour along the groundwater flow path was used as a predictive tool. The model was founded on proven scientific principles and processes (e.g., groundwater flow, contaminant transport, and geochemical reaction processes) and allowed future conditions to be evaluated. A determination of significance is not defined for the Groundwater VC; however, the results of the numerical model support the conclusion that, with the implementation of appropriate mitigation, the residual effects of the Project on the Groundwater VC will not result in a significant adverse effect to surface water. Migration of dissolved constituent concentrations along the groundwater flow path from the mining area to Whitefish Lake (the local surface water receptor) is predicted to take hundreds to thousands of years, with concentrations in groundwater reaching Whitefish Lake remaining below values that would result in an environmental risk.

As assessment was completed to understand the potential cumulative effects of the Project with existing and future developments on the Groundwater Quantity and Quality. No cumulative effects are expected since changes in Groundwater Quantity and Quality are localized and not anticipated to overall spatially or temporally with changes in groundwater associated with existing or reasonably foreseeable developments. Results of cumulative effects assessments for VCs in the aquatic environment are discussed in the next section.

Groundwater Quantity and Quality will be monitored from pre-Construction through Operation to assess the performance of the engineering mining designs and performance and infrastructure designs put in place to protect the Groundwater VC. During Decommissioning, monitoring will focus on demonstrating that groundwater remediation within the ISR mining zone meets decommissioning objectives. In Post-Decommissioning, the primary objectives of monitoring will be to demonstrate that natural flow conditions are re-established, and that chemical stability has been achieved with respect to groundwater quality. Chemical stability will be demonstrated by verifying groundwater reactive transport of constituents of potential concern in remediated groundwater aligns with the predictive model. A groundwater monitoring plan including an excursion contingency plan and measures for adaptive management will be implemented for the Project.

## 5.4 Aquatic Environment

### 5.4.1 Surface Water Quantity

The Surface Water Quantity VC considers hydrological parameters of interest, including flow regimes and water levels in watercourses and waterbodies within defined study areas. Key considerations of the assessment are associated with how Project activities, including but not limited to water-taking activities, treated water release, and changes to drainage patterns, may change hydrological conditions.

Denison initiated baseline hydrological monitoring for the Project in 2011, which has continued to the present. The extensive hydrological records for the area were utilized to establish a site-specific hydrological flow model to support the effects assessment for the Project.

Project interactions with the Surface Water Quantity VC are generally associated with changes in watershed areas as a result of mine construction and implementation of the water management plan, water-taking activities, and treated effluent discharge. The full measure of change in watershed areas will be realized during Construction, whereas water-taking activities and treated effluent discharge will occur through Operation and Decommissioning.

To mitigate the residual effects of the Project on Surface Water Quantity, Denison will minimize water taking activities by maximizing recycling of contact and process water for re-use. Denison will also limit and stage construction of the Project Area, maintain existing drainage patterns with the use of culverts, where applicable, and maintain access roads by periodically regrading and/or ditching to improve water flow, reduce erosion, and manage vegetation growth.

Flows and water levels in lakes and rivers within the LSA for the Surface Water Quantity VC are expected to experience some adverse change (i.e., reduction) as a result of altering the drainage areas reporting specifically to Whitefish Lake and water taking from this same waterbody. However, under all scenarios, including under low flow (5<sup>th</sup> percentile), the reduction in flow is

expected to be less than 3% and, therefore, below the criterion for magnitude of 5% - which is the level that would be considered a low effect to existing environmental flows. Effects to surface water flows and levels are also predicted to be localized to the sub-watersheds within proximity to the Project and specifically Whitefish Lake. The effects are predicted to be fully reversible following Decommissioning as natural drainage patterns will be restored. Following mitigation through design and water management, the residual effects on Surface Water Quantity from the Project are predicted to be not significant.

As the interactions of the Project with the Surface Water Quantity VC is of small magnitude, highly localized to Whitefish Lake and not further propagated downstream of this immediate area, interaction with other existing or reasonably foreseeable activities are not expected to occur over the Project timeline. Therefore, no cumulative effects are expected for the Surface Water Quality VC.

Monitoring programs will be established for confirming the predictions made in the assessment. The programs should remain consistent with the historical long-term monitoring study to facilitate continued establishment of long-term streamflow trends at the site through relationships to long-term, government-operated hydrometric gauging stations in the same watersheds.

#### 5.4.2 Surface Water Quality

The Project is located in a primarily undisturbed area of the boreal forest and the existing water quality in the lakes and rivers is indicative of a low level of disturbance. Water quality parameters during baseline were generally below guidelines for the protection of aquatic life; however, several constituents had concentrations above the guidelines, including aluminum, lead, copper, iron, and cadmium. In these cases, the maximum concentration was only marginally above the guideline value. The waters within the LSA and RSA sustain aquatic life and support activities that are important to local users and Indigenous peoples. Changes to Surface Water Quality have the potential to influence (i) biodiversity and biological function through direct exposure and indirect food chain influence (i.e., aquatic sediments, fish and fish habitat, and benthic invertebrates), and (ii) the cultural values of Indigenous peoples and communities, the general public, and other Interested Parties.

Project activities may interact with Surface Water Quality during all Project phases. In general, the interactions were characterized as being primarily associated with routine controlled discharges from the site. During site preparation and construction, the primary effect pathway related to the mobilization of suspended material into natural surface water features is as a result of land disturbance and clearing. During Operation and Decommissioning, water from the treated effluent monitoring ponds will be released to the environment and directed to Whitefish Lake only. Direct discharge of treated effluent to the natural environment has the potential to change surface water constituent concentrations and temperature. Potential effects to Surface Water Quality as a result

of Project discharges (surface drainage and effluent release) to local receiving environments were assessed by way of conservative numerical modeling.

To mitigate effects of the Project on Surface Water Quality, Denison will develop and implement a site-wide water management plan that includes an integrated framework to manage water quality and establish water management practices for each of the primary site aspects and areas of the site where contact water is expected. Water management will include maximizing the recycle and reuse of contact and process water to reduce freshwater intake and release of treated effluent to Whitefish Lake. Denison will design the treated effluent discharge diffuser/outfall to provide effective mixing and dilution such that discharge flows do not detrimentally affect water quality in a localized area of Whitefish Lake. Denison will also develop site-specific effluent treatment protocols to meet release limits in accordance with provincial standards and licence/permit conditions.

Residual adverse effects are expected on Surface Water Quality due to the mobilization of solids and treated effluent discharge to Whitefish Lake; however, with the implementation of appropriate design criteria for site water management and the effluent discharge pipeline and diffuser, in addition to meeting provincial and federal criteria for discharge criteria and mine water treatment (as needed), the residual effects of the Project on Surface Water Quality are anticipated to be not significant.

The residual effects of the Project are expected to temporally interact with the residual effects of other projects and activities in the surface water quality RSA. The primary Project activity potentially contributing to cumulative effects on surface water quality is the discharge of treated effluent to the aquatic environment during Operation and Decommissioning which may interact with other projects' releases to drainages which ultimately report to Russell Lake. Temporal overlap of foreseeable projects and the Project will also occur during "future centuries" as there is potential for increased contaminant transport via groundwater to surface water during this period. During all phases ("Future Centuries" included) the changes in surface water quality due to effluent discharge or groundwater interaction from foreseeable projects and activities are not anticipated to spatially overlap with those from the Project and therefore a cumulative effect is not expected.

Monitoring programs will confirm the effectiveness of mitigation measures and predictions made in the assessment and will include measurement of radiological and non-radiological water quality parameters to meet regulatory criteria. Monitoring will occur within the collection ponds and the receiving water (i.e., Whitefish Lake). In consultation with Indigenous communities, relevant federal and provincial agencies, and other Interested Parties, in the development and implementation of this VC-specific program, specific monitoring and follow-up plans will be prepared to refine and finalize the monitoring approach.

### 5.4.3 Sediment Quality and Benthic Invertebrates

The Sediment Quality and Benthic Invertebrate VCs were selected for inclusion because Project activities have the potential to affect them via erosion-driven mobilization of suspended sediment, groundwater interactions with surface water features, and treated effluent discharge to the natural environment throughout all phases of development.

Baseline sediment quality surveys confirmed that the waterbodies in the LSA (i.e., McGowan Lake, Whitefish Lake North, and Whitefish Lake South) were dominated by clay substrates, with silt and sand being present in lesser proportions. For parameters where sediment quality guidelines are available, sediment metal concentrations in these waterbodies were at or below their respective reference criteria or guidelines for the protection of aquatic life.

Benthic invertebrate communities were characteristic of depositional lake habitats (i.e., chironomids, midges, water fleas, and worms) in McGowan Lake and Whitefish Lake. Overall, the diversity of benthic invertebrate communities was highest in McGowan Lake followed by Whitefish Lake South and then Whitefish Lake North.

The physical and chemical attributes of aquatic sediments directly influence benthic invertebrate community distribution, diversity, abundance, and health. Potential changes to water quantity and quality are key considerations in the assessment process and draw a high level of concern from interested parties. Changes to Surface Water Quality have the potential to influence sediment particle size, chemistry, and distribution within the aquatic environment, and in turn influence biodiversity and biological function. Such effects are of interest with respect to the cultural values of Indigenous communities.

Project activities may interact with Sediment Quality and Benthic Invertebrates during all Project phases. In general, the interactions were characterized as being primarily associated with (i) routine controlled discharges from the site and (ii) mobilization of suspended material into natural surface water features as a result of land disturbance and clearing. During Operation and Decommissioning, water from the effluent monitoring ponds will be tested prior to release to the environment. Routine discharge of this sort will be directed to Whitefish Lake only. Additionally, a reduction in surface drainage reporting to Whitefish Lake, due to Project development activities, may change water levels and flows in the receiving water, thereby influencing the depositional properties of the lake and the benthic invertebrate community. The installation of the pipeline and diffuser structure will result in the overprinting of a small proportion of the Whitefish Lake (LA-5) benthic substrate (less than 0.05% of LA-5).

To mitigate effects of the Project on Sediment Quality and Benthic Invertebrates, Denison will develop and implement a site-wide water management plan that includes an integrated framework to manage water quality and establish water management practices for each of the primary site aspects and areas of the site where contact water is expected. This plan will include the collection

and monitoring of contact water to determine whether treatment is required prior to release to the environment, which will inform optimal levels of treatment. This plan will also include the monitoring and management of effluent, including contingency for effluent treatment as may be required so that water discharge objectives are achieved as defined by applicable provincial and federal regulatory instruments. These measures are expected to mitigate effects associated with mobilization of solids and changes to Sediment Quality that may affect Benthic Invertebrates. Denison will design the discharge diffuser/outfall to have the smallest footprint possible while still providing effective mixing and dilution such that discharge flows do not detrimentally affect sediments.

The assessment predicted residual effects to Sediment Quality and Benthic Invertebrates due to change in sediment quantity and physical quality (particle size), change in sediment quality (chemical composition), change in aquatic habitat (area), and change in water level or flow; however, with the implementation of appropriate mitigation measures and the predicted effects being assessed as low magnitude, localized, and fully reversible, the residual effects on Sediment Quality and Benthic Invertebrates are anticipated to be not significant.

The residual effects of the Project are expected to temporally interact with the residual effects of other projects and activities in the Sediment Quality and Benthic Invertebrate VCs RSA. The primary Project activity potentially contributing to cumulative effects on sediment quality and benthic invertebrates is via the surface water quality pathway and specifically through the discharge of treated effluent to the aquatic environment during Operation and Decommissioning which may interact with other projects' releases to drainages which ultimately report to Russell Lake. Temporal overlap of foreseeable projects and the Project will also occur during "future centuries" as there is potential for increased contaminant transport via groundwater to surface water during this period. During all phases ("Future Centuries" included) the changes in surface water quality due to effluent discharge or groundwater interaction from foreseeable projects and activities are not anticipated to spatially overlap with those from the Project and therefore a cumulative effect on Sediment Quality and Benthic Invertebrates is not expected.

Monitoring and follow-up are recommended for the Sediment Quality and Benthic Invertebrate VCs to verify the accuracy of the predicted effects and effectiveness of proposed mitigation measures. The sediment quality and benthic invertebrate monitoring program will be considered in conjunction with the surface water quantity (hydrology) and surface water quality monitoring programs as they are specifically tied to these programs from the perspective of pathways of effects. Monitoring of total suspended solids in the effluent monitoring ponds and other catchment ponds, prior to discharge to the environment, will be important in providing context to further evaluate Project-related effects to Sediment Quality and Benthic Invertebrates in the receiving water environment (Whitefish Lake or LA-5).

#### 5.4.4 Fish and Fish Habitat

The Fish and Fish Habitat VC was selected for inclusion in the assessment as Project activities have the potential to cause erosion-driven mobilization of suspended sediment. Project activities are also expected to discharge treated effluent to the natural environment, overprint fish habitat, and locally increase access to fisheries resources with the addition of a new access road and temporary increase of employees to the site. Furthermore, inclusion of the Fish and Fish Habitat VC is vital due to its importance to Indigenous peoples from a cultural and subsistence perspective. Fish and Fish Habitat is inclusive of wetland features within the LSA, and for the purposes of this assessment the Fish and Fish Habitat VC should be considered in tandem with the Wetlands VC, which is further discussed in Section 9 of the EIS.

Fish and fish habitat surveys in the LSA and RSA identified river, stream, and lake features that support a variety of fish species, including Lake Trout, Lake Whitefish, Northern Pike, Walleye, Yellow Perch, Arctic Grayling, and several other sucker and forage fish species. With the help of Indigenous Knowledge, Local Knowledge, and in-field surveys, critical spawning and nursery habitats for keystone species were identified and summarized for the LSA, specifically for Whitefish Lake and Russell Lake. Baseline conditions for the Fish and Fish Habitat VC were assessed in conjunction with baseline information specific to the Surface Water Quantity and Surface Water Quality VCs due to the interconnected nature of these VCs.

Project activities may interact with Fish and Fish Habitat during all Project phases. In general, the interactions were characterized as being primarily associated with routine controlled discharges from the site and mobilization of suspended material into natural surface water features as a result of land disturbance and clearing. During Operation and Decommissioning, excess treated water from the effluent monitoring ponds will be released to the environment. Routine discharge of this sort will be directed to Whitefish Lake only. Changes in Surface Water Quality due to treated effluent discharge may affect the water chemistry and water temperatures of Whitefish Lake. The installation of the pipeline and diffuser structure (discussed above) will result in the overprinting of a small proportion of the Whitefish Lake (LA-5) substrate (less than 0.05% of LA-5). No other alteration, disruption, or destruction of aquatic habitat in the LSA is expected. Changes in fish populations resulting from increased fishing activity, which may occur following improved accessibility due to the development of access roads, are also possible.

To mitigate effects of the Project on Fish and Fish Habitat, Denison will develop and implement a site-wide water management plan that includes an integrated framework to manage water quality and establish water management practices (i.e., runoff control and silt fencing) for each of the primary site aspects and areas of the site where contact water is expected. This plan will include the collection and monitoring of contact water to determine whether treatment is required prior to release to the environment, which will inform optimal levels of treatment. This plan will also

include the monitoring and management of treated effluent, including contingency for effluent treatment as may be required so that water discharge objectives are achieved as defined by applicable provincial and federal regulatory instruments. These measures are expected to mitigate effects associated with mobilization of solids and changes to water and sediment quality that may affect Fish and Fish Habitat. Denison will design the discharge diffuser/outfall to have the smallest footprint possible while still providing effective mixing and dilution such that discharge flows do not detrimentally affect fish lifecycle processes.

Construction of the access road will involve the installation of two stream crossings. These stream crossings are located at the historical watercourse crossings along the proposed airstrip access road. These crossings will be constructed as clear-span bridges, and their mitigative design will provide for protection of Fish and Fish Habitat.

A lack of transportation to fishing areas will minimize the geographic extent of any workforce fishing, and a lack of facilities to store or cook fish will limit the quantity of harvest.

The assessment predicted residual effects on Fish and Fish Habitat due to change in water quality (including temperature), change in sediment quality, change in aquatic habitat (aerial extent), and change in fish harvest from increased site access. However, with the implementation of appropriate mitigation measures, the predicted residual effects were characterized as low magnitude, localized, and fully reversible, and are, therefore, anticipated to be not significant.

The residual effects of the Project are expected to temporally interact with the residual effects of other projects and activities in the Fish and Fish Habitat RSA. The primary Project activity potentially contributing to cumulative effects on Fish and Fish Habitat is via the surface water quality pathway and specifically through the discharge of treated effluent to the aquatic environment during Operation and Decommissioning which may interact with other projects' releases to drainages which ultimately report to Russell Lake. Temporal overlap of foreseeable projects and the Project will also occur during "future centuries" as there is potential for increased contaminant transport via groundwater to surface water during this period. During all phases ("Future Centuries" included) the changes in surface water quality due to effluent discharge or groundwater interaction from foreseeable projects and activities are not anticipated to spatially overlap with those from the Project and therefore a cumulative effect on Fish and Fish Habitat is not expected. Physical alteration or loss of fish habitat is expected to be localized and of small spatial extent. No interactions with existing and reasonably foreseeable activities are envisioned over the Project timeline in this regard; therefore, no cumulative effects are expected to Fish and Fish Habitat.

Monitoring for the Fish and Fish Habitat VC will occur to verify the accuracy of the predicted effects and the effectiveness of the proposed mitigation measures. Effluent and receiving water quality monitoring will be conducted as per federal and provincial regulations and will include radiological

and non-radiological parameters. Monitoring of the biological environment will be undertaken to meet federal and provincial regulations (e.g., Metal and Diamond Mining Effluent Regulations Environmental Effects Monitoring program) and will occur in consultation with Indigenous groups. Monitoring of worker habits in relation to fisheries resources may be applicable to allow for adaptive management of the Fish and Fish Habitat VC.

#### 5.4.5 Fish Health

The Fish Health VC was selected for inclusion as treated effluent discharge to the natural environment has the potential to change chemical and radiological exposure. Furthermore, inclusion of the Fish Health VC is vital due to its importance to Indigenous peoples from a cultural and subsistence perspective. Generally, constituents of potential concern in fish may include heavy metals, including mercury. Concentrations of mercury and selenium in fish tissues collected during baseline studies were below guidelines that are protective of human health and freshwater aquatic life.

The main Project activity that may affect Fish Health is the release of treated effluent to Whitefish Lake. Changes in surface water quality and sediment quality have the potential to affect Fish Health in the receiving environment.

To mitigate effects of the Project on Fish Health, Denison will develop and implement a site-wide water management plan that includes an integrated framework to manage surface water quality and establish water management practices for each of the primary site aspects and areas of the site where contact water is expected. This plan will include the collection and monitoring of contact water to determine whether treatment is required prior to release to the environment, which will inform optimal levels of treatment. This plan will also include the monitoring and management of treated effluent, including contingency for effluent treatment as may be required so that water discharge objectives are achieved as defined by applicable provincial and federal regulatory instruments. These measures are expected to mitigate effects associated with changes in Surface Water Quality and Sediment Quality that may affect Fish Health.

The assessment predicted residual effects on Fish Health due to treated effluent discharge. Identified residual effects are expected to be associated with changes in Surface Water Quality and Sediment Quality; however, the changes are expected to remain well below levels that may affect Fish Health. Considering this, and with the implementation of appropriate mitigation measures, the predicted residual effects of the Project on Fish Health are expected to be not significant.

The residual effects of the Project are expected to temporally interact with the residual effects of other projects and activities in the Fish Health RSA. The primary Project activity potentially contributing to cumulative effects on fish health is via the surface water quality pathway and specifically through the discharge of treated effluent to the aquatic environment during Operation and Decommissioning which may interact with other projects' releases to drainages which

ultimately report to Russell Lake. Temporal overlap of foreseeable projects and the Project will also occur during “future centuries” as there is potential for increased contaminant transport via groundwater to surface water during this period. Changes to fish tissue concentrations in the LSA are also predicted to remain within or near existing levels and are not predicted to be associated with effects on Fish Health, nor propagated further downstream (i.e., to Russell Lake). During all phases (“Future Centuries” included) the changes in surface water quality due to effluent discharge or groundwater interaction from foreseeable projects and activities are not anticipated to spatially overlap with those from the Project and therefore a cumulative effect on Fish Health is not expected.

A monitoring program for Fish Health is recommended to confirm the effectiveness of mitigation measures and predications made in the assessment. The program will involve the collection of multiple fish species to assess changes in fish tissue concentration of constituents of interest.

## 5.5 Terrestrial Environment

### 5.5.1 Terrain, Soil, and Organic Matter/Peat

The Project Area is primarily located on undeveloped forested land (with some discrete anthropogenic disturbance) within gently rolling terrain characterized by eskers and drumlins. The Project has mostly been sited on stable terrain designated as upland and/or anthropogenically disturbed land (>99% of the Project Area), and (to the extent possible) avoids lowland, lakes, and waterbodies. The soil erosion potential and susceptibility to compaction will likely vary depending on slope class and slope position and other site-specific characteristics (e.g., cover vegetation and exposure).

Primary Project activities with the potential to cause adverse effects on Terrain, Soil, and Organic Matter/Peat including surface land clearing, major earthworks, surface/grading preparations, and/or associated mobilization of equipment, assets, and personnel that will occur during Construction, Operation, and Decommissioning. Denison will rely on a variety of mitigation measures to minimize potential effects on Terrain, Soil, and Organic Matter/Peat, including Project design measures to optimize the Project Area, development of an erosion and sediment control plan, and a commitment to progressive and final reclamation to achieve a safe, stable, and self-sustaining landscape.

Following implementation of these Project-specific mitigations, the assessment predicted residual effects on Terrain (morphology and stability), Soil (quantity and quality), and Organic Matter/Peat (quantity). Changes in Terrain, Soil, and Organic Matter/Peat are anticipated to be within the range of natural variation; therefore, the residual effects are predicted to be not significant. The residual effects of the Project are expected to interact with the residual effects of other projects and activities in the Terrestrial RSA resulting in potential cumulative effects on Terrain, Soil and Organic Matter/Peat. With the implementation of appropriate Project mitigation measures and best

management practices (i.e., applicable to all projects within the Terrestrial RSA), the cumulative effects are also predicted to be not significant.

Monitoring programs are recommended for confirming the effectiveness of mitigation measures and predictions made in the assessment, and then implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project. These include monitoring during Construction to verify that the Project is built to design specifications, soil salvage monitoring during any land clearing activities, and soil quality monitoring during Operation.

### 5.5.2 Vegetation and Ecosystems

The Project Area is in an area of the boreal forest with minimal existing anthropogenic and some past wildfire disturbances. The area is dominated by upland jack pine and black spruce forests in various stages of post-fire regeneration, with smaller areas of wetland ecosystems along streams and seepage areas and associated with shallow lakes. One listed plant species was observed during vegetation surveys (i.e., Alaskan clubmoss).

The main Project activities that may affect Vegetation and Ecosystems, Listed Plant Species, and Wetlands are clearing activities during Construction, water management and use, vehicle and aircraft traffic, and the use of equipment during all Project phases. Effects on Vegetation and Ecosystems, Listed Plant Species, and Wetlands include direct disturbance through vegetation clearing and soil disturbance, and indirect effects such as introduction and/or proliferation of invasive plants, edge effects, change to water quantity and quality, and dust deposition.

To mitigate effects of the Project on Vegetation and Ecosystems, Listed Plant Species, and Wetlands, the Project Area is located mostly within previously disturbed areas, minimizing direct and indirect disturbance on vegetation. Denison will clearly delineate the boundaries of the Project to reduce accidental encroachment, conduct appropriate soil salvage and soil management, maintain surface water drainage, implement sediment and erosion control measures and suppress dust (as warranted), and monitor for the introduction and proliferation of invasive plants.

The assessment predicted residual effects on Vegetation and Ecosystems, Listed Plant Species, and Wetlands due to changes in the extent of habitat types, changes in the constituent concentrations of potential concern in plant tissue, changes in the number of listed plants, and changes in the area of wetland ecosystems. The residual effects of the Project are expected to interact with the residual effects of other projects and activities in the Terrestrial RSA resulting in cumulative effects on Vegetation and Ecosystems. The residual effects of the Project and the cumulative effects (interacting with residual effects from other projects and activities) on Vegetation and Ecosystems, Listed Plant Species, and Wetlands are predicted to be not significant.

Monitoring programs are recommended for confirming the effectiveness of mitigation measures and predictions made in the assessment, and then implementing adaptive management (if/where

applicable) to reduce effects during the lifetime of the Project. Vegetation and invasive plants will be routinely monitored throughout the life of the Project, soil monitoring during salvaging and stockpiling activities will be undertaken, and progressive reclamation and revegetation of disturbed areas will be monitored. Monitoring will also be employed to understand uptake of constituents of potential concern in plants (if any). Pre-construction surveys for listed plant species will also be undertaken within previously unsurveyed locations in the Project Area.

### 5.5.3 Ungulates, Furbearers, and Woodland Caribou

The Project is in an area characterized by relatively low human use and provides suitable habitat for a variety of terrestrial wildlife species, including moose, furbearers (such as wolverine, pine marten, mink, and muskrat), and woodland caribou.

The main Project activities that may affect wildlife habitat and mortality are clearing activities during Construction, vehicle and aircraft traffic, and the use of equipment during all Project phases.

To mitigate effects of the Project on wildlife habitat and mortality, the Project Area is mostly within previously disturbed areas, minimizing direct and indirect habitat loss and/or alteration. Denison will conduct site clearing activities outside of the sensitive time periods for wildlife, conduct pre-clearing wildlife sweeps to identify sensitive wildlife habitat or presence of species at risk, minimize noise from Project activities, and optimize transportation and equipment use.

The assessment predicted residual effects on wildlife via direct loss of habitat through vegetation clearing, changes in how wildlife may use their preferred habitats due to sensory disturbance, direct mortality through wildlife-vehicle collisions, and indirect mortality due to the potential for increased harvest and/or predation. The residual effects of the Project are expected to interact with the residual effects of other projects and activities in the Terrestrial RSA resulting in cumulative effects on wildlife. The residual effects of the Project and the cumulative effects (interacting with residual effects from other projects and activities) on terrestrial wildlife are predicted to be not significant.

Monitoring programs are designed to meet regulatory requirements and/or to demonstrate compliance with environmental commitments made in the EIS. Examples include pre-clearing wildlife sweeps and monitoring the success of reclamation and revegetation of disturbed areas. Based on the results of the assessment, no specific follow-up monitoring (to address any uncertainties identified during the assessment process) is required for terrestrial wildlife.

### 5.5.4 Raptors, Migratory Breeding Birds, and Bird Species at Risk

The Project location, characterized by relatively low human use, provides suitable habitat for a variety of year-round resident and migratory bird species, including Bald Eagle, Osprey, waterbirds, waterfowl, upland game birds, and bird species at risk (such as Common Nighthawk, Short-eared Owl, Yellow Rail, Rusty Blackbird, and Olive-sided Flycatcher).

The main Project activities that may affect bird habitat and mortality are clearing activities during construction, vehicle and aircraft traffic, and the use of equipment during all Project phases.

To mitigate effects of the Project on bird habitat and mortality, Denison will conduct site clearing activities outside of the nesting period, conduct pre-clearing wildlife sweeps to identify the presence of occupied nests or the presence of species at risk, implement no-disturbance setback buffers around active or suspected nests as per guidelines and regulations, minimize noise from Project activities, and optimize transportation and equipment use.

The assessment predicted residual effects on birds via direct loss of habitat, changes in how birds use their preferred habitats due to sensory disturbance, and direct mortality mainly through the possibility for incidental take (i.e., the inadvertent destruction of birds and/or their nests and eggs) and vehicle collisions. The residual effects of the Project are expected to interact with the residual effects of other projects and activities in the Terrestrial RSA resulting in cumulative effects on birds. The residual effects of the Project and the cumulative effects (interacting with residual effects from other projects and activities) on birds are predicted to be not significant.

Monitoring programs are designed to meet regulatory requirements and/or to demonstrate compliance with environmental commitments made in the EIS. Examples include pre-construction nest surveys and monitoring the success of reclamation and revegetation of disturbed areas. Based on the results of the assessment, no specific follow-up monitoring (to address any uncertainties identified during the assessment process) is required for birds.

## 5.6 Human Health

### 5.6.1 Human Health

The Project is located at a remote site, with no populated communities in proximity. However, Indigenous Knowledge and Local Knowledge indicate the presence of local cabins and the practice of traditional activities (e.g., hunting, fishing, and gathering) within the RSA for the Human Health VC. The Human Health VC and associated key indicator were evaluated via an environmental risk assessment that included a human health risk assessment and an ecological risk assessment. The selection of human receptors (camp worker, seasonal resident, recreational fisher/hunter, fisher/trapper, and future permanent resident) for evaluation of the Human Health VC was informed by Indigenous Knowledge, Local Knowledge, information from baseline studies, and professional judgement. The assumptions made for the traditional foods diet (i.e., amounts consumed and food types) were informed by an existing English River First Nations' country foods study and through engagement with a local fisher/trapper.

The main Project activities that may affect Human Health are air emissions during Construction, Operation, and Decommissioning, and the release of treated effluent to Whitefish Lake during

Operation and Decommissioning. Long-term transport of groundwater constituents to Whitefish Lake in future centuries may also affect Human Health far into the future.

To mitigate effects of the Project on Human Health, Denison will develop and implement a site-wide water management plan, develop site-specific effluent treatment to treat constituents of potential concern to appropriate release limits, monitor and manage effluent, and create and implement a dust management plan.

The assessment of Human Health through the human health risk assessment predicted residual effects on the fisher/trapper receptor (one of six human receptors evaluated) from eating a relatively significant amount of fish near the inlet at Russell Lake. The assessment predicted that the fisher/trapper could ingest an elevated amount of selenium over the Project phases if 183 kg (402 lbs) of fish was consumed annually. Comparatively, a traditional user's annual fish consumption was predicted to be 27 kg/year from the English River First Nation's Country Food Study (CanNorth 2017) and 88 kg/year for the high consumer for the boreal shield in the First Nations Food, Nutrition and Environment Study for Saskatchewan. The surface water and fish tissue concentrations at Russell Lake remained within an acceptable range. The fisher/trapper receptor is representative of one person who consumes a unique composition and quantity of traditional foods and the residual effect on the fisher/trapper receptor is not predicted to be significant. No residual effects were predicted for all other human receptors due to exposure to radionuclides and non-radionuclides throughout the food chain during the Project phases and far into the future during the future centuries.

For cumulative effects, existing, as well as reasonably foreseeable projects within the Wheeler River system have been considered for potential to interact with the Human Health VC due to air emissions and waterborne effluent. Air emissions from the Project are expected to be localized and unlikely to overlap with the existing or predicted emissions from existing and reasonably foreseeable projects. Potential residual effects from releases of treated mine water from existing and reasonably foreseeable projects are expected to be spatially limited in proximity to the mine site and are not anticipated to extend to the Wheeler River; therefore, no cumulative effects on human health from water and related aquatic pathways are expected.

Monitoring programs are outlined to confirm the effectiveness of mitigation measures and verifying and improving model predictions made in the assessment. Environmental monitoring would follow requirements and guidance in CSA N288.4-19 and would be informed by the results of engagement activities. Examples of monitoring include surface water, sediment, and soil samples, as well as fish tissue, benthic invertebrate tissue, and country food samples such as blueberries from Whitefish Lake, McGowan Lake, Russell Lake, and reference locations, as applicable.

### 5.6.2 Worker Health and Safety

Workers within the Project Area will be exposed to radiation from uranium-bearing materials, as well as to other workplace hazards typical of mining operations. The existing environment in the Project Area is characterized by background levels of radiation exposure from radioactive elements in the U-238 decay chain, as well as cosmic radiation. Background radiation doses are on the order of 2 millisieverts per annum (mSv/yr). Dose limits are defined in terms of incremental (above background) doses.

The Project will interact with the Worker Health and Safety VC through worker exposure to radiation from uranium-bearing materials in the wellfield and processing plant, mainly during Operation and Decommissioning. These materials include ore cuttings from well drilling, the uranium-bearing solution that carries uranium to the processing plant, precipitates removed from the processed solution, and uranium concentrate (i.e., yellowcake), which is the final product from the processing plant. Radon, a radioactive gas, is released from process materials to workplace air, and uranium concentrate dust is released to air during the dry parts of the process. Expected radiation doses to workers in different job categories were calculated for comparison to the worker dose limit of 20 mSv/yr (averaged over a 5-year period).

Mitigation measures that are part of Project design include a berm around the ore cuttings waste storage area, which provides shielding from radiation exposure, and worker use of powered air purifying respirators in the drying and packaging areas of the process plant. These mitigations were factored in during calculation of worker doses. Other mitigations include monitoring of exposure levels in work areas, personal dose monitoring of every worker, and work planning to manage time in proximity to radiation sources, all in accordance with a radiation protection plan. These mitigations are expected to keep worker radiation doses below the worker dose limit and as low as reasonably achievable. In addition, a health and safety plan will address management of non-radiological work hazards in accordance with federal and provincial regulations.

Radiation doses for all workers were calculated to be lower than the worker dose limit. Based on this result, and considering the use of monitoring and safe work practices under a radiation protection plan and health and safety plan, no residual effects on worker health are anticipated.

Cumulative effects for Worker Health and Safety were not considered since no residual adverse effects were identified.

Monitoring activities during all phases of the Project will include measuring the levels of exposure to radiation, radon, and radioactive dust in the workplace. Administrative (warning) levels and action levels will be defined for these measurements to facilitate work planning, corrective actions, and a safe working environment.

## 5.7 Land and Resource Use

Two broad categories of land and resource use were assessed relative to the Project: Indigenous Land and Resource Use (ILRU) and Other Land and Resource Use (OLRU). ILRU considered traditional or subsistence practices by Indigenous people including hunting and fishing for domestic purposes, as well as non-commercial trapping of furbearers for food or fur, gathering of natural items for ceremonial practices, herbs, roots, berries, plant medicines, food, and firewood. OLRU considered both recreational and commercial use of resources, including hunting and fishing, commercial trapping, commercial fishing, lodge and outfitting services, ecotourism, forestry, and mining, which may be conducted by either Indigenous or non-Indigenous peoples under the authority of provincial licenses or by resource allocations. It is acknowledged that certain activities in each of these categories are pursued by the same individuals, as resource harvesters often pursue both traditional and commercial harvests simultaneously.

### 5.7.1 Indigenous Land and Resource Use

The Project is within the Nuhtsiye-kwi Benéne of ERFN, the traditional territory of Kineepik Metis Local #9, and the Nuhenéné of the Athabasca Denesųliné communities. Much of the documented shared use of land and resources by Indigenous communities occurs close to their primary populated communities, although some uses are documented in proximity to the Project footprint and surrounding areas such as Russell Lake and along the Wheeler River. Recorded uses include hunting sites (moose and woodland caribou), the gathering of plants for food or subsistence purposes, trapping of aquatic furbearers (including beaver and muskrat), and fishing (including Walleye, Northern Pike, Lake Trout, Lake Whitefish, and Arctic Grayling). Proximal to the Project, many of the most recent uses were by an ERFN Trapper who passed away prior to the filing of the EIS. These uses are considered as representative of future land use by the ERFN. Other Indigenous groups have documented uses on Russell Lake, proximal to the Fox Lake Road, and areas south of the Key Lake Gate.

The Key Lake gate on Highway 914 limits access to areas close to the Project site to lease holders (e.g., cabin owners) and some Indigenous communities. The closest areas of more intensive community use are ERFN's cultural camp at kilometre 160 and Kineepik Métis Local #9/Northern Village of Pinehouse's cultural camp at kilometre 67, which are south of the gate along Highway 914.

The various phases of the Project have the potential to induce different effects on ILRU and its KIs: resource availability for harvesting subsistence resources (terrestrial and aquatic resource availability and health of resources), land and waters available for traditional practices, and perceived suitability of land and resources (aesthetic experience, perceived suitability of resources for safe use, and quality of resources of consumption).

The KIs of resource availability, land and waters available for traditional practices, and perceived suitability of land and resources for aesthetics were not carried forward to residual effects assessment and can be eliminated, reduced, or controlled through mitigation measures. Mitigation for these effects is well understood. It is expected that wildlife and fish will still be available and abundant enough to support traditional harvesting practices, the health of the resources is not expected to be affected, and the lands and waters affected by the Project are minimized, in part by the small Project Area, which is 1.69 square kilometres.

The Project is expected to have an adverse effect on the perceived suitability of the lands and resources therein for some resource users in the area closest to the Project Area and on either side of local access roads and the haul road for the Key Lake operation – McArthur River operation. The effects are a result of the Project's presence, the introduction of a different uranium mining method in the region, noise, dust, increased competition for resources, and concern about personal exposure to contaminated water and soils. This effect is anticipated to vary by individual; some may continue activities and others may avoid areas close to the Project.

To mitigate effects of the Project on the perceived suitability of lands and the resources therein, Denison will develop management plans, implement emergency response programs, and minimize the amount of land disturbed by the Project to the greatest extent practicable. Mitigation will reduce risks associated with increased traffic, noise, air quality, the potential for constituents of potential concern to enter the environment, waste management, the introduction of a different mining method, and human health. The mitigation strategies that have been proposed have been successful in similar contexts, such as management of noise, traffic, dust, and competition for resources.

Denison acknowledges that Indigenous communities continue to have an interest in obtaining a greater understanding about the ISR mining method, and will continue to engage meaningfully with them through the life of the Project. Overall, given the extent of the ILRU LSA, adverse effects are low in magnitude, the geographic extent of effects are limited, and the effects are reversible, the residual effects on ILRU are anticipated to be not significant.

The residual effects of the Project are expected to interact with the residual effects of other projects and activities in the ILRU RSA, resulting in potential cumulative effects to Indigenous land use activity in the area. This is largely due to the proposed Highway 914 extension project.

With mitigation measures, the residual effects of the Project and the cumulative effects (interacting with residual effects from other projects and activities) may result in increased competition as additional resource users may access the area from locations further north, as well as from the south as the Key Lake gate would be bypassed. These cumulative changes could exacerbate perceptions of the areas suitability for continued Indigenous land and resource use.

Monitoring or follow-up activities proposed for ILRU relate largely to those programs associated with the biophysical environment.

### 5.7.2 Other Land and Resource Use

OLRU activities include commercial and recreational activities, which tend to occur in the OLRU LSA and consist of trapping, commercial fishing, and leaseholders and cabin owners. Trapping and commercial fishing take place in the OLRU LSA and was known to be conducted exclusively by the ERFN Trapper who passed away prior to the time of filing the EIS. It is anticipated that the ERFN trapline allocations may be passed to another individual in the future. Lease holders and cabin owners with land tenures can also be found near the Project. The current extent of commercial and recreational uses is limited due to access restrictions at the Key Lake gate, which limit access to those with a lease, commercial license, those who operate outfitting businesses, and members from select Indigenous communities.

The various phases of the Project will have different effects on OLRU and its KIs: change to resource availability (including terrestrial and aquatic resource availability and the health of resources); land available to conduct recreational and commercial harvests (including the availability and accessibility of land and waterways); and changes to the perceived suitability of land and resources (including aesthetics of resource use and perceived suitability of resources for safe use). The KIs of resource availability and land available to conduct recreational and commercial harvests were not carried forward to residual effects assessment as these effects can be eliminated, reduced, or controlled through mitigation measures.

The Project is predicted to have an adverse effect on the perceived suitability of the lands and resources therein for some resource users in the area closest to the Project Area and on either side of local access roads and the haul road for the Key Lake mill operation – McArthur River operation. The perceived suitability of lands and resources for safe use may be affected by the Project's presence, traffic, noise, dust dispersion, air emissions, and the potential for constituents of potential concern to enter to the environment. The introduction of a different uranium mining method in the region may further cause concern for some resource users. This effect is anticipated to vary by individual; some may continue activities and others may avoid areas close to the Project. Typically, the magnitude of perceived effects declines with increasing distance from the Project and Project activities.

To mitigate effects of the Project on the perceived suitability of lands and the resources therein, Denison will develop management plans, implement emergency response programs, and minimize the amount of land disturbed by the Project. Mitigation will reduce risks associated with increased traffic, noise, air quality, the potential for constituents of potential concern to enter the environment, waste management, the introduction of a different mining method, and human

health. The mitigation strategies that have been proposed have been successful in similar contexts, such as management of noise, traffic, dust, and competition for resources.

Denison had established a relationship with the ERFN Trapper who recently passed away. If another trapper is interested in taking over the late ERFN Trapper's trapline in the future, Denison will enter into a relationship with them similar to what was contemplated previously with the ERFN Trapper. Given the low magnitude and limited geographic extent of residual effects along with the context that resource users have exhibited resiliency to changing conditions, the overall residual effects of the Project on OLRU are predicted to be not significant.

The residual effects of the Project are expected to interact with the residual effects of other projects and activities in the OLRU RSA, namely the Highway 914 extension project, resulting in potential cumulative effects to commercial and recreational resource users. This is largely due to the Highway 914 extension project.

With mitigation measures, the residual effects of the Project and the cumulative effects (interacting with residual effects from other projects and activities) may result in increased competition as additional resource users may access the area from locations further north, as well as from the south as the Key Lake gate would be bypassed. As most other land and resource use activities are regulated by the Province, it is not expected that direct competition for uses would be affected, however the presence of additional people may reduce the wilderness experience for some users. These cumulative changes could exacerbate perceptions of the area's suitability for continued use.

Monitoring or follow-up activities proposed for OLRU relate largely to those programs associated with the biophysical environment, such as for wildlife and water quality. No additional monitoring or follow-up activities are proposed for OLRU.

### 5.7.3 Heritage Resources

The Project includes areas that the Government of Saskatchewan's Heritage Conservation Branch classify as being sensitive (i.e., areas that have the potential to contain heritage resources as they are in undisturbed terrain near significant waterbodies, rivers, or streams). Heritage resources consist of physical and cultural heritage sites. Archaeological sites were considered in the Heritage Resources assessment. Denison completed two Heritage Resources assessments during baseline studies, and two archaeological sites were identified in the Project Area. Since each archaeological site included only a single artifact, the Heritage Conservation Branch determined that the sites were of low interpretive value and work could continue as planned.

Despite the completion of two Heritage Resources assessments during baseline studies, it is possible that additional archaeological sites may be identified during the life of the Project. Project activities that may disturb the ground, including clearing and levelling activities, drilling of holes,

infrastructure construction, reclamation, and traffic throughout the life of the Project, may affect archaeological sites.

To mitigate effects on archaeological sites, Denison has developed and implemented a Heritage Resources Management Plan (HRMP). The HRMP outlines the steps that Denison will take if an additional archaeological site is identified during the life of the Project. These steps include having the archaeological site assessed by a qualified archaeologist, holding discussions with local Indigenous leadership, and implementing mitigation measures as directed by the Heritage Conservation Branch. The mitigation measures may include avoidance of the site, systematic testing of the site, an archaeological excavation, and/or construction monitoring.

Residual effects on archaeological sites may involve a decrease in the number of archaeological sites. The assessment predicted that given the low number of archaeological sites identified in the Project Area, and considering measures outlined in the HRMP to make sure any additional archaeological sites are assessed properly, the likelihood of residual effects on Heritage Resources is considered low with a low frequency of occurrence. This resulted in the overall conclusion that residual effects of the Project on Heritage Resources are anticipated to be not significant.

## 5.8 Quality of Life

### 5.8.1 Cultural Expression

Cultural Expression provides an understanding of the activities that Indigenous people in the LSA, which is reflective of the same spatial boundaries as Indigenous Land and Resource Use, which are considered as the activities that support Indigenous communities' cultural continuity. The Cultural Expression VC considers changes to the KIs of knowledge transmission and the traditional diet. Knowledge transmission encompasses cultural activities and practices that provide an opportunity for knowledge sharing among family and community members with measurable parameters including changes to cultural practices that support knowledge transmission and changes in the location of cultural practices that support knowledge transmission. The traditional diet includes species such as moose, woodland caribou, fish, and berries, and is of cultural and traditional importance to Indigenous communities. Traditional diet considered the measurable parameters of changes in the availability of country foods included in a traditional diet and changes in the perceived suitability and safety of foods in a traditional diet.

The Project and its activities may change the location of cultural practices that support knowledge transmission and the participation in cultural practices and subsequent knowledge transmission. Indigenous Land and Resource Use changes are expected to persist in proximity to the Project and in the LSA; however, knowledge transmission is often site-specific. For example, cultural camps support the transmission of knowledge on the land. Cultural camps near the Project Area are located south of the Key Lake gate, with the ERFN cultural camp located at kilometre 160 of Highway 914, and cultural camps hosted by Pinehouse Lake held at Gordon Lake, Muskeg Lake, and

at kilometre 67 of Highway 914. Participants in the *Métis Knowledge Study* noted overlap with other Indigenous cultural camps, such as Kilometer 160 of the Key Lake Road, demonstrating the kinship ties that the Métis maintain with their “extended First Nations relations” (MN-S and Two Worlds Consulting 2023). These locations are not expected to be affected by the Project. The anticipated lack of effect to cultural camps, a small Project footprint, and likely persistence of the undertaking ILRU activities throughout the LSA are expected to minimize potential effects of the Project to knowledge transmission. Further to this, participation in the worker rotation system is not expected to substantially change opportunities for Project employees to participate the traditional land use activities that support cultural activities and associated knowledge transmission.

For traditional diet, the Project may reduce the availability of country foods because of changes to the abundance of harvested resources, restricted access, and avoidance of areas where the Project is located, including areas where hunting, fishing, trapping, and gathering occur. For Indigenous peoples, the traditional diet is often preferred, and it is considered healthy. The Project’s potential effects on the availability and abundance of species that are important to a traditional diet (e.g., moose, Walleye) are expected to be low; however, the perceived suitability of country foods was still considered as having potential to be adversely affected by the Project.

The Project may adversely affect traditional diet for residents of the LSA through perceived changes in the suitability and safety of resources that support a traditional diet, particularly for activities that occur in proximity to the Project. As a result, some resource users may change their behaviour and limit the amount of traditional foods in their diet. The availability and abundance of those resources is not expected to substantially change; therefore, such changes may be limited to a small number of users proximal to the Project site. The residual effect to the traditional diet overall is expected to be low in magnitude.

To mitigate effects of the Project on the traditional diet, mitigation measures associated with the Project include adopting culturally sensitive employment policies to reduce the potential effects of Project employment on cultural activities; working with Indigenous communities to understand culturally important periods; reducing the Project footprint to the extent practicable; reducing risks associated to increased traffic, noise, air quality, and the potential for constituents of potential concern to enter the environment; and implementing an environmental monitoring program consistent with Canadian Standards Association for nuclear facilities and mines.

The residual effects of the Project are expected to interact with the residual effects of other projects and activities in the Cultural Expression RSA resulting in potential cumulative effects. This is largely due to the Highway 914 extension project. As the effects of the Highway 914 extension project on harvested resources are not tied to perceived changes in the suitability of harvested resources, no overlap occurs between the effects of the projects on the traditional diet key

indicator, specifically changes in the perceived suitability and safety of country foods in a traditional diet. Therefore, no cumulative effect is anticipated for Cultural Expression.

No monitoring or follow-up activities are proposed specific to Cultural Expression. Monitoring and follow-up activities proposed for ILRU will focus on the biophysical environment and the resources that support cultural expression.

### 5.8.2 Community Well-being

Community well-being can be defined in multiple ways, depending on the community or the people being considered. The assessment focused on ways in which the Project could interact with Community Well-being, and included the KIs of population and demographics, employment and associated income for local workers, and community cohesion. Individuals and families may have experiences associated with the Project that vary in different ways, with the possibility of both positive and negative outcomes.

The Project is not expected to substantially change the population and demographics of communities in the LSA because 1) the Project will rely on a fly-in/fly-out worker rotation system with pick-up points in the LSA and outside of the LSA, thus minimizing any requirement to relocate to access employment and 2) the definition of Residents of Saskatchewan's North currently requires an extended period of residency in order to qualify. These factors limit the potential for immigration to the LSA.

Project employment and business opportunities could provide additional income to individuals and households. Additional income could be beneficial as increased income is associated with improved health outcomes, or if used to support traditional harvesting activities (e.g., buying a new quad, repairing a boat) or purchasing healthier foods. Increased income has also been shown in various studies to have certain negative impacts on community cohesion, such as potential for increased use of substances, spending time away from family during worker rotation, with resulting potential increases in household stress levels.

To mitigate effects of the Project on community cohesion, Denison will work with communities to develop culturally sensitive hiring practices and provide supports to individual workers and their families. Supports could include (i) providing multiple centrally located pick-up points for fly-in/fly-out workers to minimize the potential for migration and time spent away from families; (ii) establishing health and wellness programming, life skills and financial literacy programming, an Employee and Family Assistance Program, a no drug and alcohol policy on site; and (iii) implementing culturally sensitive employment policies (e.g., having an Elder on site for counselling). After mitigation, and given the small size of the operation (180 employees during operation), Project residual effects related to income and community cohesion are expected to result in positive and some potentially adverse outcomes. The communities overall are resilient and expected to accommodate the anticipated changes as there is already considerable experience

with other similar fly-in/fly-out operations in the region. Overall, the conclusion for changes to income and community cohesion relative to Community Well-being is that the residual effects are expected to be not significant.

The cumulative effects assessment considered the Highway 914 extension project; however, the two projects (the Project and the Highway 914 extension project) have distinct local and regional study areas, meaning the geographic boundaries for each project are unique. Potential changes to community cohesion resulting from employment are unlikely to result in any discernable changes, particularly as the opportunities associated with the all-weather road may involve a broader labour pool. Accordingly, the cumulative effects conclusions are predicted to be not significant.

Monitoring and follow-up would be used to monitor progress on achieving employment and contracting targets and identify opportunities to improve employment and procurement, continue and maintain communication with communities, and contribute to the overall and continual improvement of the Project.

### 5.8.3 Infrastructure and Services

Infrastructure and services play an important function to the communities in the LSA and beyond. The assessment considered the potential for the various phases of the Project to affect KIs related to Infrastructure and Services VC that were identified as important through Project-related engagement – including traffic, community infrastructure and services, and emergency services capacity. Changes could be caused by increased traffic volumes and potential increases in collisions on roadways requiring the use of emergency services, increased demand on community infrastructure and services (e.g., support for family members of workers participating in the worker rotation system), and increased demand for emergency services as in the event of an accident or malfunction at the mine site or along Highway 914.

Project related traffic volumes are expected to be similar during Construction and Operation and are anticipated to be similar or less during Decommissioning. During Construction, the truck average annual daily traffic (TAADT) and average annual daily traffic (AADT) volumes are predicted to increase by 14 and 22 vehicles, respectively. During Operation, both the TAADT and AADT are predicted to increase by 18 vehicles to 32 and 40 vehicles, respectively. This increased truck traffic is considered low in magnitude.

As the LSA communities are located away from the Project site, most physical Project activities, except for vehicular traffic to move equipment, supplies and personnel, are not predicted to affect Infrastructure and Services in the LSA. The Project site and associated camp will be fully equipped to meet the needs of the Project and its workforce and will operate independently. The extent to which community infrastructure and services and health and emergency services will be affected would vary by community and individual and depend on the capacity of existing facilities and

services. Supports provided to employees on site, inclusive of an Employee and Family Assistance Program, are expected to minimize potential effects to community services.

Accidents and malfunctions are the key factor that could increase pressure on emergency services; however, they were determined to be highly unlikely to unlikely in probability (EcoMetrix 2022), as they would be mitigated by various preventative operational protocols and the emergency response plans Denison will implement. Vehicular accidents are the only potential effects pathway for the Infrastructure and Services VC, that could not be effectively addressed on site and may, therefore, require emergency services from communities in the LSA.

Mitigation for Infrastructure and Services broadly includes the use of designated pick-up and drop-off points; appropriate driver training; an Emergency Response Plan in case of a spill; on-site and accessible services and programs for workers and families; ongoing communication between Denison, LSA communities, and relevant authorities; an on-site primary care paramedic; a health and safety management plan; services and programs provided on-site and accessible to workers (including health and wellness programming, health promotion, immunization programs, life skills programming, and workforce education); and an Employee and Family Assistance Program.

The communities are generally resilient and are expected to accommodate the anticipated changes associated with the Project as they have considerable experience with other similar uranium operations in the region. The overall conclusion relative to changes to Infrastructure and Services is not significant.

The cumulative effects assessment considered the Highway 914 extension project, which has the potential to increase traffic volumes along the existing Highway 914. Although estimates of traffic volume increases were not provided in the Highway 914 extension project EIS, it is safe to assume that the cumulative effects could be an increased requirement for maintenance and increased potential for collisions that could result in injury or death to people and wildlife. The Highway 914 extension project implemented the following mitigations:

- reducing project-related traffic during construction;
- implementing speed limits in specific areas of concern;
- installing and maintaining signage along the highway; and
- conducting regular inspection and maintenance activities on the highway and associated components.

Although the cumulative changes to traffic may be discernable to users of the highway, it is anticipated that the overall increases in traffic can be effectively managed.

With respect to community infrastructure and services, both projects (the Project and the Highway 914 extension project) are removed from communities, and thus the potential for changes

in demand could stem from (a) employment and (b) emergency response. With respect to employment, the Highway 914 extension project may involve a broader labour pool, and as such cumulative effects are not anticipated. For emergency response, the Highway 914 extension project would allow for connections to community-based emergency services beyond the LSA, thus potentially reducing capacity constraints on any one community. Accordingly, the cumulative effects conclusions are predicted to be not significant for Infrastructure and Services.

With the application of mitigation measures, the assessment of cumulative effects and determination of significance for community emergency services capacity does not change with consideration of the Highway 914 extension project. For monitoring and follow-up, vehicular accidents will be monitored on Highways 165 and 914 for noticeable increases. Denison will also continue to liaise with communities, service providers, mine/mill operators, and emergency response providers for the duration of the Project.

## 5.9 Economics

The various phases of the Project will have different effects on Economy and its KIs: employment and training, income, the traditional economy, government revenues, and business opportunities.

The Project is expected to create employment and business opportunities and increase income for workers and businesses in the LSA. Opportunities include an estimated workforce during the Construction period of approximately 300 people and during the Operations phase of 180 people. Mining positions are higher paying than many other industrial positions. Residents and communities in the LSA will be given first priority for employment and training and business opportunities, followed by Indigenous and/or other communities in the RSA. The Project is also anticipated to positively affect the governments of Saskatchewan and Canada through payments (e.g., uranium royalties, corporation income tax, personal income tax) that are directly and indirectly linked to the Project activities. Because the Project is expected to positively affect employment and training, income, business opportunities, and government revenues, these effects were not carried through the residual effects evaluation.

Changes associated with Project employment may also affect the traditional economy of residents in the LSA through: (1) the physical presence of the Project and its associated activities and how these may interact with traditional activities and (2) participation in the wage economy and how this can contribute to an individual's ability to partake in traditional activities, including that the commuter-rotation system may result in some individuals having less time to participate in the traditional economy. The Project is not expected to have a significant effect on Indigenous and other land and resource use close to the Project site; these types of land and resource use activities near existing uranium operations have persisted in proximity to these sites. With respect to traditional resource users in the LSA, there is less certainty regarding the extent to which participation in the workforce may affect individual traditional resource use behaviours. It is likely

to vary by individual, and in many instances traditional resource use may be positively supported by the income gained through employment.

To maximize potential positive effects of the Project for the Economy VC, mitigation includes the implementation of a workforce development plan to initially prioritize Indigenous and non-Indigenous Communities of Interest in the LSA for employment and training opportunities; establishment of a procurement approach through all phases of the Project with a focus on businesses based within the LSA communities, followed by Indigenous and/or businesses in the Regional Study Area; and development of the Project's Surface Lease Agreement and Human Resource Development Agreement.

Generally, the mitigation measures designed to protect Indigenous land and resource use measures are expected to be protective of participation in the traditional economy. For certain specific cases, there may be a need for one-off arrangements (i.e., a trapper compensation agreement if/when an existing trapline is passed to another individual), to be responsive to other considerations potentially brought forward by select Indigenous communities.

For the most part, effects of the Project are expected to be positive to the Economy VC and have the potential to contribute to both the LSA and RSA and beyond. The only potential residual adverse effects relate to the traditional economy, which can be mitigated in large part by measures related to potential changes to land and resources use. Any residual adverse effects will occur in the LSA, and are expected to be potentially frequently occurring (due to the daily nature of work) but negligible to low in magnitude, medium-term in duration, and reversible after Decommissioning.

The cumulative effects assessment, which involved the Highway 914 extension project, considered the same factors as changes to ILRU. Cumulatively, the magnitude of changes to traditional economy are associated largely with changes resulting from the Highway 914 road extension project, as easing access would result in an increase of users in the area potentially putting pressure on the items harvested as part of the traditional economy, particularly relative to existing conditions in which access restrictions are currently in place.

Monitoring would be used to assess progress on achieving employment and contracting outcomes. Follow-up items will be focussed on the continuation and maintenance of communication about topics of importance with Indigenous and non-Indigenous communities. Monitoring relative to the traditional economy includes those activities associated with ILRU.

## 5.10 Accidents and Malfunctions

An assessment of potential accident and malfunction was carried out in alignment with federal (CNSC 2020) and provincial (Government of Saskatchewan 2014a, 2014b) guidance, as well as

recent EA practice in consideration of proposed uranium mining developments in the Athabasca Basin.

The objective of the assessment was to evaluate the potential human health or biophysical environmental effects resulting from radiological and conventional accidents and malfunctions in consideration of proposed environmental protection measures. The assessment considered all mine-life phases focusing on the Project site, the Project site access road and specific off-site locations along the mine-related transportation route (i.e., provincial highway system) of interest to local Indigenous peoples.

The assessment followed a risk-based approach, whereby hazards were identified, design features and mitigation measures were considered, likelihood and consequence were evaluated, and an overall risk rating based on likelihood and consequence was assigned using a risk matrix.

A total of 70 potential Project-related hazard scenarios were identified and evaluated through the initial screening process as described above.

Seven scenarios were considered moderate or high risk and were advanced for more detailed quantitative assessment. The results of the quantitative assessment of the seven accident and malfunction scenarios are summarized below:

- Loss of freeze capacity – The scenario whereby a loss of containment of mining solution would occur due to loss of freeze capacity was deemed “highly unlikely”. The freeze wall provides tertiary containment, and the postulated excursion could only occur under the highly unlikely scenario where the multi-barrier containment system was compromised by independent events, over a prolonged period of time. In this highly unlikely event, migration of lixiviant (mining solution) is likely to be slow and localized and mitigation could be implemented. The consequence was deemed to be “major”. The overall risk rating for this bounding scenario in consideration of probability and consequence was determined as “moderate”.
- Loss of integrity of the freeze wall – The scenario whereby there would be a loss of freeze wall integrity due to an external seismic event was deemed “highly unlikely”. The Project area has a very low level of seismicity—there have been no recorded earthquakes with a magnitude greater than 3 within 200 km of the site (NRCAN 2021b). In this highly unlikely event, and assuming the seismic activity does result in a loss of freeze wall containment, migration of lixiviant (mining solution) is likely to be slow and localized and mitigation could be implemented. The consequence was deemed to be “major”, given the potential impact to the underlying freeze wall infrastructure, which could take a significant amount of time to repair/replace. The overall risk rating, however, for this bounding scenario in consideration of probability, consequence and mitigation measures, was determined as “moderate”.

- Vessel or pipe leak inside the processing building – Based on data from the Center for Chemical Process Safety of the American Institute of Chemical Engineers on the average probabilities of failures for different components in processing plant, the probability of this scenario was assessed as “likely”. The severity of the consequences of this scenario was predicted to be “minor”, given control measures within the processing plant and emergency response measures. The overall risk rating for this bounding scenario in consideration of probability and consequence was given as “low”.
- A terrestrial release (to ground) of radioactivity, fuels or chemicals – Based on traffic and accident statistics it was determined that the probability that this scenario would occur was “unlikely”. The severity of the consequences of this scenario was predicted to be “minor” given control measures, the likely limited spatial extent of potential effects, and emergency response measures. The overall risk rating for this bounding scenario in consideration of probability and consequence was given as “low”.
- Aquatic release of uranium concentrate (radioactivity) – Based on traffic and accident statistics it was determined that the probability that this scenario would occur was “highly unlikely”. The severity of the consequences of this scenario was predicted to be “moderate” given control measures, the likely limited spatial extent of potential effects and their transience, and emergency response measures. The overall risk rating for this bounding scenario in consideration of probability and consequence was given as “low”.
- Aquatic (to water) release of fuels or chemicals – Based on traffic and accident statistics it was determined that the probability that this scenario would occur was “unlikely”. The severity of the consequences of this scenario was predicted to be “moderate” given control measures, the likely limited spatial extent of potential effects and their transience, and emergency response measures. The overall risk rating for this bounding scenario in consideration of probability and consequence was given as “low”.
- Fire and/or explosion within the processing plant – Based on data from the Center for Chemical Process Safety of the American Institute of Chemical Engineers on the probability that this accident and malfunction scenario may occur, the probability of this scenario was predicted to be “highly unlikely”. The severity of the consequences of this scenario was predicted to be “moderate”, given control measures, emergency response measures and the expected level of exposure to radioactivity for workers and the public. The overall risk rating for this bounding scenario in consideration of probability and consequence was given as “low”.

Overall, based on the assessment of accidents and malfunctions presented herein, it is anticipated that potential effects could be addressed through engineering design and compliance with industry best practices that reduce risks associated with the hazard scenarios to ALARP. Based on this assessment, the risks may be characterized as tolerable.

## 5.11 Effects of the Environment on the Project

Both the *Canadian Environmental Assessment Act, 2012* and the Canadian Nuclear Safety Commission's *Generic Guidelines for the Preparation of an Environmental Impact Statement – Pursuant to the Canadian Environmental Assessment Act, 2012* require an environmental assessment to account for changes to the Project that may be caused by the environment. The environmental setting of the Project has affected its design and will affect its management over the life of the Project.

Environmental components that have influenced the Project design (e.g., site selection, layout, and engineering) include the following:

- Geology and terrain have influenced the mine location and layout.
- Indigenous Knowledge of land and resource use was incorporated into the design of baseline programs and selection of valued components for the environmental assessment. It was also integral to informing Project design, influencing selection of access road alignments, mining methods, and proposed treated effluent discharge locations.
- Vegetation communities and wetlands influenced the size of the Project Area, which has been reduced to the extent practicable.
- Consideration of potential effects to fish and fish habitat led Denison to design the Project to recycle process water to the greatest extent possible, thereby reducing the demand for fresh water supply. As a result of the focus on water recycling, the volume of treated effluent requiring discharge is expected to be low.

Set within this context, the focus of Effects of the Environment on the Project is on the potential effects of natural hazards on the Project (i.e., seismic events, forest fires, extreme weather, and climate change). In terms of seismic events, the potential effect on the Project is low because northern Saskatchewan, where the Project is located, is one of the least earthquake-prone areas in Canada, ranking as a low seismic hazard zone (NRC 2021 a,b).

Forest fires are common throughout most of northern Saskatchewan, and are an important natural disturbance of northern boreal forest ecosystems (Parisien et al. 2004). It is expected that Denison will enter into a fire control agreement with the Province of Saskatchewan, as other northern uranium mine and mill facilities have done, which will allow for fire fighting support from the province should a fire develop near the Project. Denison's Forest Protection Program will include information on how to prevent and suppress forest fires near the Project. Fire guards (i.e., buffer zones of 30 m) will be established and maintained between specific Project facilities (e.g., main camp, processing plant) and forested areas to minimize potential risks from forest fires. On-site emergency response equipment will be available for fire suppression and setting up fire

suppression systems, and staff on site will be trained in the operation of this equipment and in fire-fighting readiness and techniques.

Various mitigation measures and management plans will be put in place at the Project to minimize the effects of extreme weather events (i.e., major precipitation events, drought, extreme high and low temperatures, extremely high winds) on the Project, including, but not limited to, the following examples:

- Suitable equipment and design systems will be selected for the Project to enable operation under extreme weather events.
- Denison's emergency preparedness and response plan for the Project will include information on planning for and responding to severe weather events.
- Weather forecasts will be monitored, which will provide advanced warning and time to prepare for extreme events.
- Health and safety policies will be implemented, and risk assessments will be undertaken, before working in adverse weather conditions.
- Employees will be required to wear appropriate personal protective equipment (e.g., rain gear) while working outside in extreme weather. Radio communication will be maintained with anyone working away from the mine site under these conditions.
- Diesel generators will be available on site at strategic locations, outside of site runoff areas, to provide back-up power in the case of a power outage. Generators will be used to maintain power to the processing plant and the accommodations facility, as well as to maintain other essential services, when required.

Climate change can be defined as a long-term change in average weather patterns, particularly since the early 20<sup>th</sup> century, that are largely attributed to increased levels of atmospheric greenhouse gases produced by human activities (NASA 2021). In general, research suggests increased warming over the coming decades due to climate change is likely to cause changes in the frequency, severity, and/or nature of weather extremes in the northern portions of North America (IPCC 2021). Climate models are used to depict how the climate is likely to change in the future at particular locations. Climatic projections for the Project were derived from an interactive, online climate modelling tool (i.e., Climate Atlas; PCC 2019).

The Project will be developed with consideration of the predicted changes in climate conditions that could occur during its lifecycle from pre-construction design through to monitoring during Post-Decommissioning. Denison has incorporated design features, mitigation measures, and management plans related to forest fires and extreme weather into the Project, which are also applicable to environmental changes due to climate change. The Project has also been designed using engineering best practices and will meet current regulations and building codes. Additional

growing days due to predicted increased temperatures may be beneficial to the Project during Decommissioning, allowing for accelerated revegetation and reclamation of natural vegetation communities.

## 6 Monitoring and Follow-up Programs

Monitoring programs are designed to meet regulatory requirements (e.g., permit or license conditions), and/or to demonstrate compliance with environmental commitments made in the EIS. Follow-up programs are those that are proposed to address any uncertainties identified during the EA process (e.g., to verify predictions made during the EA; determine the effectiveness of proposed and implemented mitigation measures) and to determine when to implement adaptive management measures.

Information on monitoring and follow-up programs presented within the EIS is conceptual in nature and provides a preliminary description of the activities proposed for the Project. Detailed programs will be developed as Project designs are finalized, which may influence the nature, frequency, and locations of monitoring activities. Input from regulatory agencies, the public, and Indigenous Peoples will be considered. Monitoring and follow-up programs will be finalized as the Project advances into and through the licensing process.

Monitoring and follow-up programs for the Project will be integrated within Denison's overall EMS framework (see Section 3.4.4) and implemented through the various programs, plans, and procedures that would be developed therein. Generally, Denison is anticipating establishing monitoring and follow-up programs in relation to the following VCs (as outlined in the various subsections of Section 5):

- Air Quality and Noise;
- Groundwater;
- Surface Water Quantity and Quality;
- Fish Habitat and Health;
- Terrain and Soil;
- Vegetation and Ecosystems, Listed Plant Species, and Wetlands;
- Ungulates, Furbearers, and Woodland Caribou;
- Raptors and Migratory Breeding Birds;
- Human Health and Worker Health and Safety;
- Indigenous Land and Resource Use, Other Land and Resource Use, and Heritage Resources; and
- Economy.

## 7 Conclusions

On the basis of the Project information and related evaluation and assessment of effects, Denison believes that the Project can be constructed, operated, and decommissioned in a manner that is not likely to cause significant adverse effects to the biophysical or human environments.
